CONTRIBUTORS' GALLERY

VILHJALMUR STEFANSSON was born in Manitoba in 1879 and was educated at the State Universities of North Dakota and Iowa and at Harvard University. During his life he has been almost everything from cowboy to reporter on the Boston "Evening Transcript" and associate instructor in anthropology at Harvard. Among his numerous Arctic expeditions are a private expedition to Iceland in 1904; an archaeological expedition to Iceland for Harvard University in 1905; and an Arctic expedition under the auspices of the American Museum of Natural History and the Geographic Survey of Canada in 1908, during which he made valuable collections and investigations and reported the so-called blond Eskimo. He was the Commander of the Canadian Arctic Expedition which sailed from Victoria, British Columbia, in 1913 for four years' exploration north of Canada and Alaska.

AGNES REPPLIER, whose essays are known wherever there are people who enjoy English cleanly written, is of French extraction. She has spent much time in Europe and has received the Letaire Medal from the University of Notre Dame. Among her numerous volumes are "Books and Men," "Essays in Idleness," and "Counter Currents." She lives in Philadelphia.

JOHN HALL WHELOCK has been with Charles Scribner's Sons since 1911. He is the author of several volumes of poetry, and also of "Theodore Roosevelt: A Bibliography." Mr. Wheelock's new book of poems, "The Black Panther," is announced for publication some time during the fall.

BRANDER MATTHEWS'S article in the Book Table on Molière is from an address which this distinguished critic delivered before the American Academy of Arts and Letters on the occasion of its recent Molière celebration. Two members of the French Academy journeyed to America to take part in this notable international event.

WILLIS FLETCHER JOHNSON began his journalistic career in 1880 on the editorial staff of the New York "Tribune," with which he has been associated as, successively, day editor, editorial writer, and literary editor. He has been lecturer at a number of schools and colleges and a member of the Council at New York University. He is the editor of "History of New York University," published in 1903, and the author of "A Century of Expansion," "America and the Great War for Humanity and Freedom," and "Political and Governmental History of the State of New York." At present Mr. Johnson is an editor of the "North American Review."

FAITH BALDWIN started in pursuit of Pegasus at the age of eighteen. She has contributed to many of the leading magazines, and her first novel, "Mavis of Green Hill," was published in 1921. She spent two years, 1914 to 1916, studying in Dresden and Berlin, Germany.

A novel of compelling interest

A MAN OF PURPOSE

By Donald Richberg

12mo. 336 pages. Net \$1.75

The amazing life-story of a man who dared. Reads like a document from life and grips the reader from the opening page. The unforgettable portrait of a human soul.

A Dictionary of Classified Quotations

Edited by W. GURNEY BENHAM. 8vo. 660 pages. Net \$5.00.

NORTH CAROLINA

BINGHAM SCHOOL

MEBANE, N.C.
ESTABLISHED 1793

AN IDEAL BOYS' SCHOOL IN PIEDMONT NORTH CAROLINA

Here, at Bingham, the spirit of old-time Southern hospitality makes each boy feel genuinely welcome. High moral tone. Military organization, begun in 1861. Lovely lawns. Gymnasium. Athletic park. Honor System. Celebrated climate. Outdoor classes. Limited numbers. Sports in variety. 340 acres. Summer camp. A modern school with an ancient name, fame and history. Send for catalogue.

Col. PRESTON LEWIS GRAY, President, Box 3, Mebane, N. C.

Illustration shows the "Fine Stripe and Vase Border" pattern in service.

The Cool Immaculate Beauty of Fine Linen

DURING SUMMER MONTHS the cool immaculate beauty of Fine Linen is surely the essential note in the charm of the dining table.

Hostesses find well filled Linen Closets not only a joy but a necessity.

At McCutcheon's a wealth of the most exquisite Linen awaits your selection—all of the McCutcheon standard of purity.

This Spring showing of Table Linens is characterized by a strict exclusiveness of design and a high standard of excellence at prices that are surprisingly and pleasantly economical.

Send for New Catalogue

Write today for a copy of our new Spring and Summer Catalogue No. 35 which contains special values in Household Linens, Lingerie, Waists, Laces and a host of other things.

The Magnificent Trio

JUST as the mighty *Olympic* provides a standard of luxury known throughout the world as utmost in ocean comfort, so now a trio of White Star ships in our Cherbourg-Southampton service advance trans-Atlantic passenger travel to an even higher plane.

Majestic
(56,000 tons)

The new *Majestic*
(56,000 tons)—
World's Newest
and Largest
Liner.

The *Olympic*
(46,500 tons)—
The Ship Mag-
nificent.

Olympic
(46,500 tons)

Homeric
(34,000 tons)

The new *Homeric*
(34,000 tons)—
The Ship of
Splendor.

This service is no less remarkable for its regularity than for the individual size and splendor of its ships. Travelers who formerly waited an *Olympic* sailing date to channel ports may now sail any week on one of these great ships.

Regular weekly sailings to Liverpool via Queenstown with the *Adriatic*, *Baltic*, *Celtic*, and *Cedric*, each over 20,000 tons.

Early bookings are suggested to secure most desirable accommodations.

CRISES AT GENOA

THERE are conferences and conferences. To call such a gathering as that at Genoa by the same name as that applied to the meeting of nations last winter at Washington is an indication of the poverty of language. No two gatherings could be more unlike.

At Washington there were nations which, however much their policies and purposes might differ, were willing to take one another's word as equivalent to a bond. Even the most disturbing incidents of the Washington Conference, such as some of the encounters between the Japanese and the Chinese and between the British and the French, served only to emphasize the fact that when any nation there finally pledged its word to a course of action there was no suspicion on the part of the representative of any other nation that that word would be broken. At Genoa, on the other hand, there are nations whose word is worth little or nothing in the eyes of other nations present. France, for instance, may cordially dislike England's purposes, but it does not distrust England's word. On the other hand, France and other countries, with very good reason, not only dislike Germany's purposes but also distrust Germany's word, and have no faith whatever in the words of Russia's present rulers.

Under these conditions it is not strange that the Genoa Conference has consisted of a series of crises. In diplomatic language, there has been incident after incident. One incident arises as soon as another is closed. To recount these daily occurrences of dangerous import would be wearisome. It would be useless to do so without at length explaining the moves in the game which these thirty-odd nations are playing.

In general, the nations gathered at Genoa seem to be taking sides according to the value they put upon good faith. The Bolshevik leaders from Russia put no value at all upon it, and the Germans put very little. Both the Russians and the Germans represent Governments which have been outlawed and which still bear the stigma of outlaws. They are governed somewhat by the psychology of the criminal, who thinks that, since every man's hand is against him, he is entitled to a living by his wits and is under no obligation to show good faith. When these nations were invited

(C) Underwood
TCHITCHERIN, RUSSIAN DELEGATE TO THE
GENOA CONFERENCE, PHOTOGRAPHED IN
THE GROUNDS OF THE HOTEL IMPERIAL
AT SANTA MARGHERITE

to Genoa, they accepted certain conditions laid down. Britain needs very much the trade of both of these countries, and used her influence to induce the other nations to receive their acceptances in good faith. France had very good reason to be reluctant in this matter, for she has found that Germany, after giving her signature to the Treaty of Versailles, has ever since been seeking to escape performing her part of the contract. There was every indication that France was approaching Germany in a mood of reconciliation. It is reported by a certainly not over pro-French British correspondent, J. L. Garvin, that one of the French Cabinet Ministers, de Lasteyrie, was taking the train from Paris in order to have a thorough financial discussion with the Germans when, presto! the Germans did their best to justify all the French fears by announcing their treaty with Russia, which at best has added new difficulties to the observance of the terms of the Treaty of Versailles.

Of course all this has gone to prove, what seemed obvious before, that under present circumstances in Europe it is

impossible to hold an economic conference which is not primarily political.

THE BOLSHEVIK'S AIM

FOR thus doing much to justify in the eyes of the world the course of France toward her, Germany has been charged with stupidity. Perhaps Germany is not as stupid as she seems to be. The world's memory has proved short, and the sort of things Germany did only a few years ago are passing into oblivion. Germany apparently can count on other nations' forgetfulness. What she has done in this instance is to secure at least a finger-hold upon the rich resources of Russia, and she is probably ready to gamble on the chance that the Allies will overlook this act of bad faith as they have overlooked a great many other such acts.

The Germans were told that, since they had made this arrangement with Russia, they could not be admitted into the discussions of Russian affairs, and they accepted their exclusion with apparent meekness. Moreover, they, as well as the Russians, were told that the Allies would preserve the right to declare any provisions of the Russo-German treaty which are in conflict with other treaties (for example, the Treaty of Versailles) null and void.

The Russians were told, too, that if they were going to continue in conference with other nations they must not be too truculent. The Allies' experts on Russia had met in London and prepared a report on Russian affairs which the Bolsheviks scorned in a statement which was issued by one of their officials. France promptly refused to sit with the Russian representatives until they made an explanation. In the meantime Tchi-tcherin, the Russian Foreign Minister, had issued a note in reply to the Allies' demand. The Allies had notified the Bolsheviks that their fifty billion dollar bill (which Dr. W. F. Johnson, in an article in this issue, exposes to the light of an incident in American history) was quite unacceptable. Mr. Tchi-tcherin withdrew the bill. The Allies had told the Bolsheviks that they would "write down" the war debts owing by Russia and postpone payment of interest, and even omit some parts of the arrears, and Mr. Tchi-tcherin agreed—naturally. The Allies had set certain conditions concerning the payment of debts and damages to foreign nationals; Mr.

Tchitcherin presented some counter-conditions, among which was the very important one that the Bolshevik Government should be recognized. When this apparently mild note appeared, it was explained that this superseded the truculent letter first issued, and the French thereupon resumed relations with the Russians.

In all of this the aim of the Bolsheviks is obvious. They are in desperate need of two things in order to retain their power over the Russian masses. If they get those two things at Genoa, they will go home highly pleased with themselves. One thing is recognition. The other thing is money. They have found that their plan to revolutionize the world by destroying the governments of other nations and the medium of exchange is futile. They had so conducted themselves that they won and deserved international ostracism. According to an Associated Press despatch from Moscow, the Bolshevik Government had issued up to the last of March twenty-five trillions (that is, twenty-five thousand billions, or, if you please, twenty-five million millions) of paper rubles since the first of January of this year. That seems incredible; but the whole Bolshevik scheme is incredible except for the fact that it happens to be one of the facts of an incredible era. Now these Bolsheviks find that if they are going to exploit the Russian people further they have got to have the backing of other governments not only politically but financially. So they present their fifty billion dollar bill, and present other preposterous demands, and then blandly offer to withdraw everything provided they get recognition and cash.

THE PROPOSED TEN-YEAR-PEACE TREATY

It is perhaps not surprising that in the midst of such proceedings Mr. Lloyd George's proposal for a ten-year pact of peace all around sounds rather ingenuous to those peoples who have suffered most from the criminal exploits of the German Militarists and the Russian Reds. Indeed, it would not have been surprising if the French had suggested that before they made any more pacts perhaps it would be well to see that those already made were observed.

Indeed, Premier Poincaré is reported to have declared in a speech at Bar-le-Duc, France, that all France has ever asked and all that she asks to-day is the execution of the Treaty of Versailles. "That," he is quoted as saying, "we must have and shall have. The peace of Europe depends upon it." He is reported as going still further in explicit statement by saying that he hoped that the Allies would be able to act in unison, but that France was prepared

to take the matter in her own hands, as the Treaty of Versailles authorizes, in order to protect her rights and interests. There has been a tendency in France toward a radical reduction of her military organization. Poincaré has been one of those who have cautioned his country against too rapid action in that direction, and now he points to the course of Germany and Russia as justifying his Cabinet in "daring to insist for the moment on eighteen months' military service."

Officially, however, the French Government is readier for compromise than Poincaré's speech would indicate—in deed, quite as ready for compromise as any one who knows what France has been through during the past two generations has any right to expect. The French delegation, in a statement concerning Lloyd George's proposal for a ten-year-peace treaty, has said: "It must be made clear that Germany and Russia have no aggressive intentions before the rest of Europe can agree to any such pact. If it involves the neutralization of frontier zones, it may be useful. If it involves later some form of reduction of armies, it may be beneficial. France is ready to reduce if others do so, because this would decrease expenditures, but it must affect everybody and be without a loophole for violation."

France of course is right in saying that a peace treaty had better be written in something else than water.

PASSING THE BONUS BUCK

PLANS to raise money for the payment of a soldiers' bonus have so far resembled the efforts of a man who seeks to increase the length of a piece of string by cutting off one end and tying it on the other. Congress is apparently unwilling to find any new funds for the bonus, for it is still keeping an expectant eye upon the payment of interest money on our foreign loans. At present the thought of Congress involves using interest payments from Great Britain.

Such funds, if they are received, cannot be properly applied to the bonus. Such interest should be applied to our own Liberty Bonds. For our bonds were in part sold to the Nation for the purpose of securing funds to loan to our allies. If Congress wishes to prove its sincerity in the matter of bonus legislation, let it collect the needed money by the imposition of new taxes frankly levied for the purpose of paying the bonus.

The political aspects of the bonus question are accentuated by the fact that it is proposed to increase the cash payments provided for in the House bill and to abolish some of the really constructive features, such as the land settlement plan which was incorporated in the original measure put forward by the

Legion. That land settlements and industrial loans can be of practical and permanent assistance to ex-soldiers has been proved by the example of Canada.

In an early issue of *The Outlook* an article on the Canadian system of loans to soldier-farmers will be published.

BUYING OFFICE WITH PUBLIC FUNDS

WE do not always agree with Senator Borah. But we have never doubted his independence of spirit and his readiness to fight for his convictions. This characteristic has been manifest in his public career ever since he rose to National prominence through his prosecution of the case against the murderers of ex-Governor Steunenberg.

If the Legion Post of Pocatello, Idaho, had realized this fact, they might have withheld their threat to drive Senator Borah out of public life because of his opposition to the bonus. In reply to the telegram from this Post Senator Borah said:

I observe in your telegram the threat which you impliedly make as to future political punishment. It was wholly unnecessary for you to make this threat. It reflected no credit upon you and it has had no effect whatever on me. When you come to that fight in which you propose to inflict punishment, you will doubtless be able to say many things in the way of censure upon my public service.

But one thing neither you nor any one else will be able to say, and that is, that I ever sought to purchase political power by drafts upon the public treasury, or that I chose to buy a continuation in office by putting \$4,000,000,000 upon the bended backs of American taxpayers.

I haven't much respect for the man who buys office, even though he pays for it with his own money. But the most slimy creature which disgraces American politics is the man who buys office by paying for it with appropriations out of the public treasury and charges his venal political obligations to the taxpayers.

Senator Borah's denunciation of the politician who pays for his re-election with appropriations from the public treasury constitutes an outstanding definition of an evil which is Nation-wide. It is particularly effective because it is accompanied by an act which might involve serious personal sacrifice.

THE RILEY MEMORIAL

JAMES WHITCOMB RILEY had the gift of expressing in words that the great mass of people can understand feelings that the great mass of people have. If there is any feeling that approaches universality, it is tenderness for childhood, and particularly for childhood that has not a fair chance. This tenderness can be over-sentimentalized, but it is never to be scorned when it is genuine. It is this tenderness that one

finds in Riley's verse perhaps more frequently than any other sentiment, and this verse will remain his monument long after much verse that is subtle and intellectually more mature will have been generally forgotten. In this sense Riley erected his own monument; but his neighbors have now built to his memory a monument of their own, and it is in the same vein as his verse. It is a hospital for the care of stricken children.

At the exercises at this hospital, in Indianapolis, Secretary James J. Davis, of the Department of Labor, paid a tribute to Riley in which he recognized this gift of the Indiana poet. "If the very sight of a child, if the fancies, the joys, the little griefs of a child touch us all so deeply," said Secretary Davis, "how much more touching are the fancies and joys and griefs of a child who is broken and bent and crippled! Nothing ever moved Riley to finer strains of poetry than bright, happy childhood, but nothing ever more stirred the depths of his being than the sight of childhood blighted with pain and distress." Secretary Davis mentioned the incident, which was one of Riley's earliest recollections, in which Riley saw to it that a lame schoolfellow always had the first ride in the swing under the locust trees at recess. Perhaps it is not mere coincidence that Riley's State, according to Secretary Davis, is leading in the effort to aid crippled children. Close after Indiana come New York, and Ohio, and Michigan, and Virginia, Massachusetts, Montana, Missouri, Illinois, and the rest. "In New York City alone," said Mr. Davis, "there are 36,000 cripples. A census of the Nation's cripples has never been undertaken—we have shrunk from the painful task. But let us hope that the percentage in New York is unusual, and that the country as a whole has taken no such toll of human bodies." According to Secretary Davis, there is not a State in the land that does not, through public or private means, pay heed to the needs of crippled children.

Riley's verses on "The Happy Little Cripple" contain in very simple and perhaps, to some, sentimental language a sound philosophy; for in those verses Riley represents the cripple as wondering how his aunt could, possibly be happy in a heaven where she did not have a chance to take care of him, for in heaven "they's nary angel 'bout the place with curv'ture of the spine." It is certainly true that the crippled children who are cared for in this hospital will do as much for the people of Indianapolis as the people of Indianapolis will do for them. In spite of wars and strikes and crime waves, this truth has been a dominant one in modern times.

Certainly such a hospital as the Riley Children's Memorial Hospital is as distinctive of the civilization of to-day as the amphitheaters and forums were of that of Rome.

HOME STUDY IN SING SING

UNIVERSITY work among the inmates of a State's prison is a novelty; it is also an undertaking of fine intention and aspiration. Columbia University in its courses at Sing Sing is trying to bridge the gulf between aspiration and failure, ambition and despair. It started when Mr. Spencer Miller, Jr., visited the great San Quentin Prison in California and found there a genuine interest in education as a constructive element in rehabilitation. Mr. Miller later became an assistant warden at Sing Sing, and has done a great deal to carry out the idea. Elementary instruction already existed; Mr. Miller undertook to do something for the men who entered prison with a certain amount of education and needed something more. His argument was that if the modern prison idea is to make a man capable of resuming his citizenship, there could be no means more effective than education.

In the head of the Columbia Home Study Department, Mr. Levering Tyson, sympathy and co-operation were found, for he remembered that long before a Sing Sing prisoner had written to him asking for a course in Spanish, to be paid for after his discharge. This was not possible at that time. Now a scholarship fund for such purposes is in existence and an inmate is eligible for full scholarship for a year if he is approved by the Sing Sing Mutual Welfare League, the head teacher, and the warden.

Under this plan thirty-five such scholarships were established, but this proved pitifully inadequate, for eighty applications were received from the men, and many of them still await the generous impulse of those who may be interested.

What kind of courses do Sing Sing prisoners want? In reply, we are told that some of the courses asked for but not given for lack of funds are interior decoration, automobile construction, commercial art, traffic management, and certain musical courses. Among the courses now given are English composition, advertising and selling, Spanish, agriculture, foreign exchange, newspaper writing, photoplay composition, accounting, fire insurance, American history, philosophy.

One interesting example of the work is that of a prisoner who has had a play accepted by a Broadway producer. More general results have been increase in courtesy and friendliness on the part of the prisoners to their teachers and the

growth of a spirit of mutual service among the prisoners themselves.

A CORRECTION

IN hearings before the Committee on Immigration and Naturalization of the House of Representatives, C. V. Knightley, of Boston, testified that seventeen Assyrians, women and children, deported from Ellis Island, the immigrant station in New York Harbor, landed at Constantinople and were then massacred. These people, it was finally ascertained, as a result of an investigation by the American High Commission at Constantinople, were Armenians, the party consisting of seven men, nine women, and three children (making not seventeen, but twelve women and children in all)—nineteen in the whole party. The Secretary of State, Mr. Hughes, has written to the Secretary of Labor, Mr. Davis, reporting the findings of the High Commission and saying that it appears that, "after leaving no avenue of useful investigation unexplored, the High Commission was unable to find the slightest evidence to substantiate the rumor." Similarly, a careful investigation by the Y. W. C. A. also proves the rumor to have been substantially false. The Migration Secretary of the Y. W. C. A. at Constantinople personally interviewed four of those reported murdered—one of them being the mother in a family of five. Apparently there has been no sign that a single one of the nineteen was killed. In its issue of January 4, *The Outlook*, in commenting upon the hardships of deportation, referred to this rumor, not as a fact, but as a "story" which was "told of some Armenian women and children." We are giving a great deal more space to the correction than to the original report of the rumor, both because we desire that justice be done to the Department of Labor, that is responsible for deportation, and because we are heartily glad that the story has been proved untrue.

LADY ASTOR

LADY ASTOR is one of the most extraordinary and at the same time most engaging of the distinguished persons that have recently come from the other side of the Atlantic to visit this country. As a matter of fact, she is not a foreign visitor at all. She is an American girl returning to see the home folks. She was born and raised—to use the Southern phraseology—in Virginia. Nancy Langhorne was the scion of an aristocratic but land-poor family. She had beauty, education, a quick mind, a warm heart, and a fine spirit—a heritage that is better than millions of dollars so far as happiness and effectiveness

in life are concerned. About the time she was emerging from girlhood an American millionaire, William Waldorf Astor, emigrated to England and finally became a peer of the realm. His son married Nancy Langhorne, was elected to the House of Commons, and, finally, on his father's death, inherited his father's peerage and is now Viscount Astor. Thus it happens that the American girl from Virginia is Viscountess Astor.

When Lord Astor inherited his father's title, he was, under the British Constitution, transferred from the House of Commons to the House of Lords and his seat in the Commons was vacant. His wife, who believed in woman suffrage and was active in the suffrage movement in England before the war, determined to offer herself as a candidate. She made a splendid campaign in and about Plymouth, which constituency, after a triumphal election, she now represents in the House of Commons. Her husband, Lord Astor, has publicly said that it is not surprising that she should have been elected nor is it especially to her credit; what is surprising and much to her credit, he believes, is that she has made a success as a member of the House of Commons. Her common sense, her good humor, her human sympathy, and her brilliant, sparkling, and spontaneous style of speaking have given her real influence in Parliament.

She has come to America especially to attend the Convention of the National League of Women Voters, which has just concluded its sessions in Baltimore, and she has captivated everybody she has come in contact with since she arrived in this country about two weeks ago.

Personality is a most elusive and difficult thing to describe. It is far easier for Conan Doyle to explain or to photograph ectoplasm, a stuff of which he says spirits are made, than it is for a writer to express in printed words the effect of a flashing glance, or a rippling smile, or a spontaneous gesture, or the engaging hesitation of an instant while a speaker is eagerly choosing a word with which more effectively to take the already capitulating fortress of the hearer's mind. So it is not easy to describe Lady Astor's distinctive personality. One of the most effective slang phrases of the day is "have a heart." She manifestly has a heart. Indeed, at the dinner which was given in her honor on April 20 by the English Speaking Union, in New York, she said: "I didn't quite know whether New York audiences would be as kind as Plymouth audiences. I see that they are much the same. They forgive shortcomings in the way of scholarly or oratorical attainments when they see that you are speak-

ing from your heart. I usually do speak from my heart, for I have tried my head and found it wanting."

Lady Astor denies that she has come over here on a mission. "Can't a person come home," she inquired with a smile, "without being suspected of ulterior motives?" Uttering this defense with that little whimsical turn of voice and expression of countenance with which Theodore Roosevelt used to employ humor to point a moral, she denied that she is a personage and asserted that she is "but a symbol—a sort of a connecting link between all English-speaking peoples, a frail link, perhaps, but a link that is stronger than it looks." In her various speeches and interviews she has laid great stress—from "the mother-woman's point of view"—upon the necessity for the abolition of war and for an association of nations based upon human sympathy and human co-operation.

She has not criticised or advised the American people in the slightest degree, but she has made some allusions in a semi-humorous vein which are penetrating and significant. For example, when asked of her opinion of prohibition she replied: "All I can say with conviction is that I have never met the man or woman who has been made more unselfish or better by drink, but I have seen hundreds ruined by it." Asked regarding her views of the Irish question, her answer was: "The Irish question? There will be no trouble in Ireland if they will only look forward instead of back. I have no patience with anything based on ancient prejudices and ancient wrong. I have a great admiration for the Irish; I am part Irish myself; but

they will lose sympathy throughout the world if they do not stop fighting among themselves and start looking forward." She deplores the attacks of a peculiar personal nature made on Great Britain in the United States Senate. Personalities in politics she evidently thinks unsportsmanlike. "You know," she said, "if a member of Parliament made attacks of this kind in the House of Commons on the United States, it would not be tolerated by his fellow-members. 'It is not cricket!' they would exclaim."

But the reader must not get the impression that vivacity and ever-buoyant good spirits are the sole characteristics of this charming Anglo-American or Americo-Englishwoman. She has her serious moments, in which she gives expression to the fundamental truths of her political philosophy in a language of common sense that every one can understand. Perhaps her political philosophy cannot be summed up better than she has done it in the following passage of her address to the New York League of Woman Voters, which was delivered in the Town Hall of New York City on the very evening of her arrival from her transatlantic voyage:

I can conceive of nothing worse than a man-governed world except a woman-governed world—but I can see the combination of the two going forward and making civilization more worthy of the name of civilization based on Christianity, not force,—a civilization based on justice and mercy. I feel men have a greater sense of justice and we of mercy. They must borrow our mercy and we must use their justice. We are new brooms; let us see that we sweep the right rooms.

Personally, I feel that every woman

(C) Harris & Ewing

LOBD AND LADY ASTOR AS THEY ARRIVED IN AMERICA ON THE OLYMPIC

should take an active part in local politics. I don't mean by that that every woman should go in for a political career—that, of course, is absurd—but you can take an active part in local government without going in for a political career. You can be certain when casting your vote you are casting it for what seems nearest right—for what seems more likely to help the majority and not bolster up an organized minority. There is a lot to be done in local politics, and it is a fine apprenticeship to central government. Local politics are very practical, and I think that, although practical, they are too near to be attractive. The things that are far away are more apt to catch our eye than the ones which are just under our noses; then, too, they are less disagreeable.

Political development is like all other developments. We must begin with ourselves, our own consciences, and clean out our own hearts before we take on the job of putting others straight. So with politics; if we women put our hands to local politics, we begin the foundations. After all, central governments only echo local ones.

After hearing Lady Astor's opinions on current and critical political questions and after reading the accounts of her success as a Member of Parliament, we wonder if the old aphorism, "Virginia is the mother of Presidents," may not have to be changed to—Virginia is the father of stateswomen!

INCORPORATE THE LABOR UNIONS

ON another page a labor leader, Mr. Ellis Searles, protests that the demand for the incorporation of labor unions comes primarily from "the union busters" of the country. With this we totally disagree. We also disagree with his statement that if the unions were incorporated and held legally accountable for the fulfillment of their contracts they would be "subject to the whim of hostile courts." This is also Mr. Gompers's publicly stated view. If the courts of the United States are hostile to labor, which we by no means believe, the quickest way to eradicate that hostility is to take the unions out of a special and favored class of the public over which the courts have no control.

With Mr. Searles's assertion that labor is not a commodity we are in entire sympathy. Commodity is a thing; service is rendered by a person. If a man comes to your house to sell you melons, and you know how to judge melons, the character of the man does not concern you. If a man applies to you for a position as gardener and he and you are going to work together in growing melons, it is of great importance that

WHAT AN IMMIGRANT IN THE CABINET THINKS OF IMMIGRATION

IT has been said that America is no longer a land of opportunity. It has been said that we have crystallized into a class-divided nation. The only trouble with these statements is that they are not true.

One of the proofs that they are not so occupies a place in the Cabinet of President Harding—James J. Davis, Secretary of Labor.

Secretary Davis was born in Wales. He came to this country as a boy, and worked, when a young man, as an iron puddler. At twenty-one he was president of his local branch of the Amalgamated Association of Iron, Steel, and Tin Workers of America.

We recently wrote Secretary Davis, asking him for a photograph of himself as a boy, and he replied: "Unfortunately, during the early days of my life in America our family had very little money to spend for such luxuries as photographs and portraits."

We wanted that picture to go with an article which the Secretary has written for us on the problem of the immigrant. No one is better equipped than Secretary Davis to appreciate what the immigrant owes America and what America owes the immigrant. The article will appear in an early issue of *The Outlook*.

you should know his character and that he should know yours. If a man sells you a commodity, the relation between you and him is that of seller and purchaser. If a man sells you his labor, the relation between you and him is that of co-operators in a common enterprise. At the root of much of our present industrial disturbances is the fact that both employer and employee treat labor as a commodity. The result is that the laborer is often indifferent to his employer's interest and the employer is often indifferent to the interests of labor.

But it is also true that men may contract to furnish service and that they may be held accountable for not furnishing what they agree to. A surgeon contracts to perform an operation and to attend the patient after the operation and dress the wound. If in the middle of the operation he should cease work or strike in order to get a larger fee than he agreed upon beforehand, he could be criminally punished for malpractice—

that is, for not furnishing the service which he had agreed to furnish. Society recognizes this principle in some forms of employment. Mutiny at sea is a crime. Mutiny is simply a strike against performing a service which the sailors had agreed to perform in signing the ship's articles. If Mr. Searles were on a transatlantic liner and suddenly the engineers, the firemen, and quartermasters declined to do their work and the vessel was in danger of shipwreck or the boilers threatened to explode, would he not be among the first to insist upon the forcible completion of the seamen's contract and their punishment when they reached port for breaking the contract?

Mr. Searles makes many bald assertions which cannot be sustained by the facts. He says, for example, that the prime purpose of corporations is to evade responsibility. He either ignores or is ignorant of the elementary principles of corporation law. Corporations are suable and can sue. If they are fined, the stockholders share the loss pro rata. In some cases, as, for example, in National banking corporations, the directors of the corporation are doubly liable for the fulfillment of contracts. Mr. Searles says that there are all kinds of associations in commerce which are not incorporated. If he means that those associations are not amenable to regulation by law he is of course mistaken. The courts, on the complaint of the Federal Trade Commission, have just dissolved one such association—the association formed for mutual benefit by the dealers in hardwood lumber. It is true that associations for mutual benefit which do not make legal agreements only have to comply with certain special regulations for such mutual benefit associations. But the labor unions are associations formed, not merely for mutual benefit, but to enter into contractual obligations. They either ought not to enter into these obligations or, if they do, ought to be so constituted that they can fulfill their contracts.

The trouble with the labor unions today is that they want to eat their cake and keep it. They want to hold employers to contracts, but they do not want to be held themselves. Mr. Gompers has recently admitted upon the witnessstand that the trouble with many unions is that they are in the hands of unscrupulous and petty leaders. His remedy for this condition is patience, with the hope that the long processes of education will make bad men good, although with delightful inconsistency he does not rely on such processes in dealing with bad employers. The really effective way to make unscrupulous and irresponsible men careful—whether they are employers or labor leaders—is to

impose responsibilities upon them and hold them accountable.

Nor do we think that the advantages of the incorporation of labor unions would be wholly one-sided. The very tone and tenor of Mr. Searles's article indicate what we believe to be the fact—that to-day labor unions and labor-union leaders are looked upon with distrust, suspicion, irritation, and sometimes anger by the public at large because of their sabotage, their violence, and their unwillingness to abide by their own word. If they were incorporated, that very fact would give them the social standing which they now feel they lack. The phrase, "dignity of labor," is a much abused and misused one. If, however, labor unions are to have the social dignity which Mr. Searles subconsciously feels they lack and which we believe it would be socially desirable for them to possess, one of the quickest ways in which they could achieve this dignity would be to incorporate themselves, become responsible entities, and take their place with other citizens who regard the courts and judicial procedure, not as hostile engines of a despotic government, but as the best device which democracy has discovered for the settlement of human disputes. When Mr. Searles speaks of judicial procedure as "the whim of hostile courts," does he not come dangerously near to allying himself and the cause which he has at heart with the attitude towards society which is entertained by the thug, the pickpocket, and the swindler? Labor leaders of the intellectual ability of Mr. Searles and Mr. Gompers are doing their cause as well as their country disservice in attacking the courts. If there is injustice in American courts, what labor leaders should do is to join with their other fellow-citizens, who have placed their property and treasures under the direction and protection of judicial procedure, in reforming court abuses rather than to ally themselves with lawbreakers as enemies of the courts.

The Outlook does not wish to be classed with "the union busters" of the country. It desires to see the unions incorporated because it desires to see them dignified and strengthened so that collective bargaining can go hand in hand with social justice. If, however, the labor unions wish to place themselves or to have society place them outside of the pale of the courts, they will find that this is the surest way to shipwreck. History shows that no class, whether it be composed of the wealthy or of the so-called proletariat, can long exist in nations that believe in constitutional government without being willing to submit to the rules and regulations of law which society at large has framed for its self-protection.

FAMILIAR SPIRITS

SAUL, King of Israel, was but one of the long line of those who from prehistoric days have sought the aid of witches and mediums to raise the spirits of the dead. When Saul went, disguised, to consult the woman at Endor who had a familiar spirit, and fell "all along on the earth," overcome partly by his superstitious fear of the woman's message and partly by his faintness from hunger, he cut a ridiculous figure. His conduct in this, as in other instances, serves, not as an example to be followed, but as a warning. His effort to find in the supernatural a support for his wavering faith and his timid will resulted only in enfeebling his will and corrupting his faith.

What happened to Saul has happened to many thousands of others in the ages before him, and in the ages since, and in our own day. What is called Spiritualism is chiefly, if not wholly, an attempt to escape from the normal duties and responsibilities of life by recourse to counsel and direction from the dark. For one who has the purpose of seeking clues to new truths of science through so-called mediums by a cold and impartial examination of evidence, as the chemist or physicist seeks such clues in the undisturbed seclusion of his laboratory, there are hundreds who are seeking by such means either new sensations or some comfort and solace in sorrow, or some power which they can substitute for their own will and character in the control of conduct.

We publish on another page an article by Vilhjalmur Stefansson which gives an interesting portrait of Sir Arthur Conan Doyle and incidentally an unconsciously self-painted portrait of the great Arctic explorer. We do not doubt either the intelligence or the sincerity of conviction of Sir Arthur Conan Doyle, but we do not think that his message brings a new revelation of truth and power.

Against the application of scientific methods to the search for truth no one who loves truth would wish to place any obstruction. There may be differences of opinion as to the regions in which such search for truth are most promising; as to the methods applicable in particular cases; and as to the evidence necessary for the formulation of working hypotheses. These differences are common to all realms of science. With such we are not here concerned. It is not this aspect of so-called psychical phenomena that has aroused the public interest and has given audiences to such men as Sir Oliver Lodge and Sir Arthur Conan Doyle. What sends people to the lectures of Sir Oliver and Sir Arthur

and to the séances of mediums is not a scientific impulse; it is the great desire to communicate with the spirits of the departed whom they know, and from whom they want to get some word that will make life worth while.

Since the war, when the fact of death was impressed upon the minds of many hundreds of thousands by the dramatic experiences of battle and sudden calamity, this desire has been intensified. It is, in fact, not a scientific but a religious phenomenon. There is in the minds of these hundreds of thousands a sense of wrongness, and a consequent effort to make some connection with the Higher Powers. This, as William James has pointed out in his "Varieties of Religious Experience," is the essence of religion. There are, however, helpful religions and hurtful religions, true religions and false religions, religions that build up and strengthen character and religions that demoralize. No one can observe thoughtfully this phenomenon without wondering how far it is a symptom of spiritual and moral health, and how far it is a symptom of a breakdown in spirit, morals, or mind.

No amount of evidence that the spirit of man survives bodily death is of itself, or can be made to be, of service to a true and wholesome religion. It is not what a man believes, or even knows, about life in a future existence that constitutes faith; it is rather his attitude toward life and the kind of life that he lives resulting from that attitude. The only kind of eternal life that counts is eternal life here and now. Even the resurrection of Jesus from the dead, which constitutes one of the articles of belief among his followers, did not of itself put life and heart into his disciples. It was the kind of life that Jesus lived and was able to impart to his disciples that was the source of their power and the substance of their faith; and it was not merely his bodily appearance after death that seemed significant to them, but rather the sense of his presence with them in spite of death. It was not the fact that he walked with them to Emmaus that made their hearts burn within them, but what he said to them on the way. If Sir Arthur Conan Doyle will bring to the world a message of power and life, it will not matter much where he gets it. If he can secure such messages as a result of his experiences, no one will question their validity. But the mere fact that a man who has a reputation for knowing something about evidence and who has had some scientific training in medicine reports that he has seen spirits, and has obtained from them some description of the circumstances of life after death, has no bearing whatever upon that faith

which moves mountains and transforms character.

Religious faith does not depend upon the kind of evidence that one gets either in the laboratory or séances; it is a matter of experience that is open to the child as well as the adult, the ignorant as well as the learned. The faith of a child in his father or mother is not something that you can implant by a process of reason or argument, or the production of testimony and evidence. The attorney who argues before a jury may bring the minds of that jury to a state of certainty concerning a fact, but he cannot by that same process implant in the minds and souls of the jury his own faith in a friend or a parent or a God. Evidence may convince a jury, but it cannot of itself change them from bad men to good men, from selfish men to unselfish men, disloyal men to loyal men. It is only faith that can do that—sometimes faith in a fellow-man, some-

times faith in a country, but supremely faith in a Power not themselves that makes for righteousness.

All around us in this world there are forces conspiring to develop and fortify faith. They are to be found in the records of the race, in the institutions of religion, and in the influence and power of those who have themselves grown through faith. If any man finds these forces unavailing, he will find no support for true faith in any mere evidence that the spirit of man survives the death of his body.

In the future, as in the past, men will seek some easier way to faith than the rugged path of adherence to the law of self-restraint and service, or what in the much misunderstood language of Scripture is called virtue and love. Those who believe that the universe is ruled by a Power that would supplant chaos with order, self-indulgence with self-control, and greed with love have in

themselves at least the elements of faith. For that faith they do not depend upon the witness of their eyes, or their ears, or the mere report of facts concerning the past or present, or the possible future. They can derive it only from those who have that faith and prove it by their lives.

Those who seek for faith in signs or wonders or in spirits called from the vastly deep will seek it in vain. Not even Jesus, who brought immortality to light, turned the thoughts of men to the search for evidence of life after death. On the contrary, he warned his disciples against such search and enforced his teachings by the parable in which he represents Abraham as answering the rich man in torment, who besought that one might be sent from the dead to cause his brothers to repent, and saying: "If they hear not Moses and the prophets, neither will they be persuaded, though one rose from the dead."

PAPER MADNESS

FORTUNATUS HAD A PURSE THAT WAS NEVER EMPTY NO MATTER HOW MUCH HE TOOK FROM IT—AUSTRIA HAS A PURSE THAT GROWS EMPTIER THE MORE SHE PUTS IN IT—MR. GREGG TELLS WHY

STAFF CORRESPONDENCE FROM WILLIAM C. GREGG

IF the Genoa Conference considers countries in alphabetical order, Austria will be first; there is, however, much pre-Conference help being arranged.

Lloyd George recently dressed a window showing Austria in a stabilized Loan Gown. It attracted attention; the fashion was established. Now France and Italy are also making "Loan Gowns" for Austria. Czechoslovakia is making a loan to take the place of an old coal loan. The latest news is that Holland is contemplating a loan to Austria.

There is some psychology in all this, but more business. The Bank of England owns the Anglo-Austrian Bank. Englishmen own the principal Danube navigation companies. They have large commercial relations with Czechoslovakia, which sells to Austria. Why should not England loan nine million dollars to Austria under such circumstances, especially as she has a mortgage on a lot of Gobelin tapestries as security?

France recently bought the Laenderbank, one of the large Vienna financial institutions. She has industrial interests in Austria and since before the war has held a controlling interest in the Southern Railroad Company, the only large Austrian system not Government owned.

Italy, by the Versailles Treaty, ex-

tended her northern boundary into Austria, including the great port city of Trieste. The Italians very properly supported this new acquisition by a friendly and expanding policy in Austria. They have acquired mine properties, as well as Austrian banking and commercial interests.

Surely these three Allies have business in Austria which must be looked after. They would not be the clear-headed, practical people we know them to be if they failed to try at least to improve bad conditions. There is, however, another side of business, called politics. Business and politics are always Siamese twins. Many think that they should be separated, but the operation is not performed, because a vital circulation involves them both.

Politically, France wants to be the big sister to the little entente composed of Czechoslovakia, Rumania, and Jugoslavia. They can prevent Austria from joining Germany, and together with Poland they present a solid barrier against Soviet Russia. France is interested in the development of trade routes east and west.

The political interests of Italy differ enough from those of France to make the two nations rivals in southern European society. Italy wants trade routes north and south, so that she can resume her very extensive pre-war business

with Germany. She also bids for business with the little entente by playing the rôle of big sister number two. She has recently presided over three conferences in Italy in which the little entente, Austria, and Hungary came together and improved their mutual relations. One conference was held in Rome, one in Portorose, and one in Venice. In the last the dispute between Austria and Hungary over west Hungary was settled by giving it to Austria. If you add the Genoa Conference, you may call Italy the Convention Country of Europe.

Political rivalry makes it hard to work out the purely business part of loans to Austria to re-establish her credit. I can see all kinds of lions in the way of a good solution. The danger is that England will be content with a temporary business advantage resulting from her loan. She may also foreclose on the tapestries later.

France and Italy may be opportunists. All the world is being financed in a happy-go-lucky manner. England, France, and Italy are not holding their own expenditures within their Government incomes, so we can hardly expect them to plan and impose on Austria such a financial reform as they themselves are not able to adopt, but only to talk about.

So we can prophesy that the credits

to Austria will be given by England, France, and Italy with many hopes of benefits to themselves, with many warnings to Austria, and with some plans for supervision, but with no absolute grip on Austria's collar.

Austria reminds me of the Hawaiian natives; fine looking, friendly, and estimable, but they lack character. The Austrians have never before had self-government. They are not capable of it at present, because they lack patriotism and self-control, two essentials in a republic. These qualities are at present all too scarce in any country, hence the world travail.

While staying in Vienna I have been buying some antiques. I have made large and small purchases in many stores. With one exception, they have urged me to accept a bill at a lower price than I paid, ostensibly to save me part of the Austrian export tax, but when I demurred they bluntly said that they couldn't afford to pay the 7 per cent sales tax. Of course this tax was included in the price. They collected the tax from me, but refused to pay it all to their Government. With exceptions noted later, the Austrian people appear well dressed and well fed. There is a much greater variety of food here than last year. Any one who has the money can get anything to eat or drink. There are over 250,000,000,000 paper kronen in circulation. There is very little unemployment, so every one has money, more or less. To be sure the money is worth little—seventy kronen to one United States cent—but the people have learned that it won't do to hold onto something that is falling in value, so they spend their money on themselves.

The theaters are crowded, so are the movies. One day we saw over one hundred thousand people at and around the race-course. A man may think it better to bet his money on a horse-race than to put it in a savings bank.

And this brings me to the reason for the degradation of the Austrian kronen. They were worth before the war 20 cents apiece, and at the time of the armistice 10 cents. Then people called themselves a democracy, but practiced Socialism. The Government gave every one a job, especially old soldiers. They bought food at high prices and sold at low prices. They imported coal to operate the railways and hauled people for as low as six cents per 100 miles. The first year the Government deficit was enormous; the kronen fell rapidly in value, prices started up, and the wages of state employees were increased. This increased the deficit. There was only one way to meet a deficit—with the printing press—and vast quantities of paper money were issued.

Theoretically, inflation would work all right if all wages and prices could be increased as rapidly as the value of the money decreases, but it is not humanly possible. Theoretically, when money is falling in value, it is useless to save it. It should be spent for something sub-

stantial, but it must not be held. Consequently there is great temptation to spend it for food, drink, and pleasure. It is a good time also to borrow money, if possible, and to go in debt. The chance is in favor of one paying his debt at half what it cost him. If I borrow a thousand kronen on a sixty-day note, and the krone loses one-half its value in sixty days, I am a big gainer, and the lender a big loser.

There is a case in Vienna where a man bought a house full of furniture before the war, on credit. The bill was not paid until recently. The courts decided that the man who bought the furniture need not pay more than the number of kronen called for in the original bill, so the debtor sold one chair for the needed amount and squared the account.

There are many strange phases of this financial spree. On the surface it does not seem criminal, but below one can find the old people neglected or dead; the middle class, who were not used to work, are undernourished or living scantily by selling their possessions. The proportion of unfortunate people is much larger under present Vienna conditions. Many stores are filled with jewelry, furniture, pictures, and curios that have been sold for what they would bring by people who had no choice. Much of this junk is of small value, and the owners realized little from its sale. Thousands of people are working for just enough to keep them fairly alive. I am not referring to skilled labor or common labor of a heavy type, but household servants, employees in hotels, clerks, and porters. Their appearance is semi-genteel or downright shabby. They are fairly used to the life now, and make the best of it.

I was in Vienna just a year ago. In referring to my notes at that time, I find that there were 90,000,000,000 paper kronen in circulation, with a total gold value of \$128,000,000.

Now there are 250,000,000,000 kronen in circulation, with a gold value of only \$35,000,000. Loss in total value of all paper money in one year, \$83,000,000.

It is interesting to see that the more paper money they print, the less the total amount is worth. It is possible also to understand the Vienna complaint that there is not money enough in circulation. If, for instance, the total of next Saturday's factory pay-rolls in Austria amounted to \$35,000,000 in gold, it would take the entire 250,000,000,000 kronen to pay them, leaving no money for other transactions and none in the banks.

It is also interesting to reflect that, theoretically, if Austria could raise \$35,000,000 in gold, she could buy up and burn up all her 250,000,000,000 paper kronen.

To such a depth of depreciation have sunk the promises of Socialism masquerading in the costume of democracy. To such a depth has sunk a country which used freedom as a license; first,

to spend what they had, and then what they hadn't, until no one does them honor and they mock at themselves.

Yet Austria four years ago was in about as good shape as any other war-weary nation. No country has been free from crimes against itself, including the United States, which has had a weak Congress that creates deficits to please the Socialistically inclined.

Which is the most dangerous step in the downward path—the first, the middle, or the last? America has made the first deficit step already, and seems about as complacent as the poor Austrians were when they started down.

The problem for England, France, and Italy is first to stop the Austrian deficits, then retire the present worthless paper currency, issuing a new currency with a safe amount of gold or gold equivalent behind it.

If all the credits were concentrated for this latter purpose, it would be possible of achievement, but there is not power enough inside and outside of Austria to make her reduce her expenditures to come within her income.

We have heard statements that the first decision of Genoa would be that budgets must be balanced before help could be expected. There will be no special need of help after budgets are balanced, for the whole deplorable disaster of depreciation has been caused by deficits. The exchange value has also been depressed by the same failure to balance the trade of a country by self-denial.

Austria, for instance, has worlds of forests close to Vienna and elsewhere. She could swear a mighty oath that after next September she would not import another ton of coal until her financial health was restored. She would have to change her locomotives to wood-burners and use only wood in industry and the home, a perfectly possible thing for a courageous nation to do. But Austria is not courageous; she prefers credits and coal to chopping wood and developing a national spirit.

The Vienna papers recently reported that the Senate at Washington had appropriated \$50,000,000 as a loan to Austria. On March 17 one paper, in commenting on the supposed good luck of Austria, estimated that they could live for a year on the \$50,000,000. Two-thirds of Austria think only of favor to come from outside. The other third realize their inability to make Austria stand alone and are sick at heart.

How many people in the United States are thinking about getting something from Congress, without realizing that A stands for Austria and America as well, and both can fall from the same cause—lack of patriotism and lack of self-denial? Austria is making some effort toward reforms, but, to me, the only solution is strong outside control or the division of the remnant of the once proud Empire among the adjacent countries. Italy alone might take a mandate to govern her.

THE CRIME WAVE AND LAW ENFORCEMENT

BY GEORGE S. BUCK

THERE is food for anxious thought in the crime wave sweeping over the United States, particularly when it is borne in mind that it comes on top of an appalling state of habitual lawlessness. In 1918 Cleveland had twenty times as many murders as London per one hundred thousand of population. In 1921 Chicago had fourteen times as many as Berlin. There is more crime among the two hundred thousand Sicilians in Chicago than there is among the four million in Sicily. We have much the same habits, institutions, and ideals as the Canadians. We are divided by only an imaginary line, and yet in 1913 there were eight times as many murders south of the border as north of it. Burglary insurance in the United States has increased 543 per cent in the past five years, and so the story goes. Where will this end? What are the causes? Of course so great a problem is complex. One individual can see only a section of it. Nevertheless from the experience of four years as the official head of the Police Department in a typical cosmopolitan American city of half a million people it is possible to observe some of the forces that have brought us into our present path and continue to drive us along it.

THE American people are of an obliging, accommodating nature. They have a way of passing laws to please those who want them, and those who seek new laws of a reform nature seem to have a kind of childlike faith in the power of a statute to better human conduct. Then when the act is passed and becomes law those communities which did not want it or those large elements in the population who are opposed to it look to the law-enforcing agencies to veto it by non-enforcement. The attitude of the lawmakers seems to be that a new law will leave everybody happy—the reformers because they have what they want upon the statute-books, and the rest of the community because it will be relieved of agitation and everything can go on as it did before. Some of the political leaders, influential in controlling legislation, frankly approve of this method of procedure in private and confidential conversation, but would never publicly say so, and the course of events shows that they but reflect the usual attitude of the American people.

The attempt to deal with a situation in the method just described and how it works when brought in contact with the human machinery of a police department is well illustrated by an ordinance passed by the city of Buffalo some years ago which forbade the sale of liquor on the same floor on which dancing was going on. This ordinance sought to achieve a very laudable purpose. The drawback was that there were some high-grade, perfectly respectable res-

taurants whose patrons drank so little liquor as to lead to no unseemly conduct, and who deeply resented this interference with their indulgence in the fad of dancing between courses. So the management of the Police Department let it be known that certain restaurants might have dancing, but the rest could not. Now the officer on the beat is a very suspicious and an extremely practical man. He at once argued with himself that if certain places were allowed to profit by violating the law some one higher up received pay for it, not necessarily in cash but in some way—in political support or friendship. Perhaps directly across the street from one of the restaurants favored with permission to have dancing was one to which that privilege was denied. The patrolman on that beat reasoned with himself somewhat like this: "Braun, on the north side of this street, is just as decent a fellow as Greuner, on the south. It is not fair to give this privilege to Greuner and to deny it to Braun. What is more, Braun has given me many a good cigar and hot coffee on a cold night, just out of the kindness of his heart. Now if Braun starts up dancing I am not going to see it. I shall just turn my back." After a time Braun found he could not stand the competition from Greuner's dancing attractions, so he started up. The same situation and the same reasoning applied elsewhere, and before long dancing and liquor selling were going on all over without any more regulation than if the ordinance were non-existent, except that, because the law was there and could be enforced at any time, the door was wide open for unscrupulous members of the police force to exact tribute on the threat of enforcement.

This incident illustrates perfectly the viciousness of laws which express excellent views of conduct but which run counter to the settled habits or fixed desires of a part of the community. These may not in themselves be criminal and are more a matter of morals or social customs than of governmental regulation. There arises first the resentment of those regulated, which brings pressure on the police to ignore the law; this is followed by "easing up" on some, which spreads to all, because of the human qualities inherent in those charged with the duty of law enforcement. By and by there is a gust of public indignation over non-enforcement and everything is shut up tight; as soon as the gust passes the old forces reassert themselves and the vicious circle starts over again, leaving in its wake a constantly increasing contempt for law.

As Mayor I was able to cure this particular trouble by insisting that the ordinance be amended to permit dancing and liquor selling on the same floor, provided the Mayor was first satisfied that the place was fit to be licensed, and

a fee for such permission was fixed at \$100. The effect was magical. The respectable part of the community which was determined to have dancing with its meals was satisfied; and the ordinance almost enforced itself, because every restaurateur who had invested \$100 in a license became a volunteer police officer to prevent unlawful poaching. Formerly, when a lawbreaker, he dared not start a prosecution against a fellow-lawbreaker, but when he had paid the fixed rate for his privilege he was entitled to protection, and he got it as a matter of right.

This is as simple and complete an illustration as can be found of the great advantage of laws which fit the ideas of the community. It is impossible to legislate successfully in advance of the prevailing standards of the people. Perhaps an autocrat may mark out a goal and force his people up to it, but certainly a democracy cannot do it.

It must always be borne in mind that the majority of men on a police force are honest, decent fellows. They want to command the respect and good will of the community. They cannot help reflecting the opinion of their neighbors. If the community regards a law as foolish, the officers will not have much heart for its enforcement. In addition to this, the average man wants to avoid trouble and to hold his job in peace. He does not need to be told to shut his eyes to breaches of the law. He will quickly take a hint. From the attitude of his superiors he decides what is expected of him, and if they are not keen for the punishment of all offenders, he is quite ready to be lax in the performance of his duties. In short, the police reflect very accurately the attitude of their employers on the subject of law enforcement.

IN almost every campaign involving the choice of a Mayor the question is fought out, "Shall the town be open or shut?" A multitude of our new voters do not even know what this means. If answered, "Yes," it brings in a time when gamblers can run openly, when prostitutes and pimps can ply their trades and advertise their business freely. It means that honest, faithful service by the police is discouraged. Men who have distinguished themselves by long and efficient work are passed by when promotions are made or are assigned to posts where their qualities are least effective. Every grafter on the force is busy and prosperous. The slime of falsehood and venality is everywhere. Almost every kind of crime can secure some degree of immunity, and the whole force is demoralized. The terrible thing about the whole business is that the question is submitted to the public so camouflaged that only the wise ones see the real issue. Imagine the roar of protest that would go up if a referendum

should be proposed on the naked issue, "Shall the laws be enforced? Answer by a cross under Yes or No." Of course such a question never should enter the political arena. The law is the shield of the poor and weak from exploitation and injustice and guards the security of all with few or many possessions, and its suspension in the ordering of our affairs should be unthinkable. To be a violator of it even secretly should be a burden of shame to be undertaken by no respectable person; and yet all of us are well aware of the pride which many otherwise excellent citizens take in breaking the Volstead Act.

Of course in a mayoralty campaign the question is never stated baldly as to whether the gamblers, prostitutes, and pimps shall be given free rein or have their activities restricted as greatly as possible. A mayor must take an oath of office to support the laws, and there are none who want an open town who would care to declare frankly for an open season for the purveyors of vice.

There is generally some issue back of which the "open town" forces can gather. They particularly prize some catch phrase, such as "personal liberty," or some slogan which has a quality appealing to those who honestly regard themselves as liberals, or are for some reason dissatisfied, and want to register a protest. In this way the support is gained of many who would not deliberately abet lawlessness if they realized what they were doing.

It is surprising how strong are the forces anxious for an "open town." In addition to the active participants there are, first of all, the owners of real estate, for which there is then a far greater demand. Residential districts in that transition stage which precedes the advent of business are adapted to the activities of an "open town," and when so used pay larger rentals than could be secured for any legitimate purpose. Then there are the shopkeepers who sell to the underworld, the proprietors of restaurants, theaters, dance halls, and all kinds of places of amusement. Lastly, there is the great body of people whose patronage keeps business humming in that part of the town which is open.

THESE elements are powerful factors in any election. They know what they want and from whom they can most likely get it. Owing to the habitual indifference of the electorate, it requires only twenty-one per cent, or a trifle more, of the qualified voters to carry a municipal election. If any reader questions this statement, let him take the total population of his own town, subtract two-fifths of it from the total to allow for children and aliens, and then compare the difference with the total votes cast at a municipal election, and he will see that it is substantially correct. It is because of the indifference of the voters that the question "Shall the town be open?" is so often answered in

the affirmative. Then the police force, instead of doing its duty vigorously to the full of its ability, is committed to a policy of hands off to as great an extent as the sense of public decency will permit, but it cannot keep its hands off some kinds of crime without lessening its efficiency in all lines. With certain crime this consequence is easier to trace than in others.

Take, for example, the picking of pockets. There is good reason to believe that it is a well-organized industry. In fact, those who engage in it call their work a profession. Articles taken by experienced operators are not sold locally. They are shipped out of town and turned into cash at some far-distant point. When a high-class operator falls into the toils of the law, he is furnished with bail. Often this is wired from New York, and a skillful criminal lawyer appears to defend him and utilizes every possible technicality to protect his client. Some years ago a Buffalo police officer was in New York on his vacation. While talking to a New York patrolman a pickpocket joined the group and was introduced to the man from Buffalo. "What is your friend doing here?" he asked. "Oh, he has just come to get wised up," said the New York officer. "Well, then, stranger, if that is all," said the pickpocket, "come to my flat this evening on Blank Street and I will introduce you to some prominent members of the profession." So the Buffalonian accepted the invitation, thinking that a personal acquaintance with really leading members of the profession might prove of value later on. Now this Buffalo police officer had a reputation in the underworld as a man who was honest and fair, one who used every legal means to enforce the law, but who did not take any treacherous advantage. After some years he became Chief of the Buffalo Police and set out to give the city as clean an administration as possible. He had been in office only a few months when he received a message that there were three prisoners in the jail who were very anxious to see him. So he went over, and there were three of the professional pickpockets whom he had met some years before in New York. They said: "We want to apologize to you. We have made a mistake. We did not know you were Chief. We thought the town was open and that it was all right for us to operate. If we had known you were Chief, we would not have come here. Now please do not be hard on us. If you will not press the charges against us, we promise that we will get out of town at once, and, what is more, wherever we go we will peddle it through the profession that there is nothing doing in Buffalo." The Chief decided to take them at their word, and in eighteen months the picking of pockets declined from an annual rate of over six hundred to less than one hundred. Of course it is impossible to determine what amount of this reduction was due to these three pickpockets, how much to the general reputation of the administration

which must have spread abroad among the people of the underworld, and how much to better police work. What is significant is the relation between an open town and crime. It is the evident assumption on the part of the professional criminals that in an open town they can operate with comparative impunity, and that when a city has a police administration vigorously trying to enforce the law it is advisable to keep away.

IN a large cosmopolitan city the various foreign elements are a prolific source of lawlessness, not because they are naturally criminal, but because they have been uprooted from their own soil. At the best, only a few police officers can speak the most common foreign tongues, and with some languages it is necessary to depend upon interpreters. This is always an obstacle in the pursuit of criminals. The children of immigrants pick up English and frequently their parents do not, with the result that the youngsters feel their superiority. This helps to break down the discipline of the home and is reflected in time in the criminal records. The various nationalities present a great obstacle to the uniform enforcement of the laws. This is especially the case when the strictly American element is in the minority. Some races have customs of Sabbath observance utterly at variance with that of others. Some believe in Sunday baseball. Some do not. Some want dancing at public gatherings on Sunday or theatricals or bowling, others do not. And so it goes.

Since this is so and we have in our midst large masses of population with social ideas and customs foreign to our own, rather than try to force them through our mold by legal processes it would be better for the respect for law either to legalize or license what is not inherently wrong and trust to time, education, and social influence to weld us into a homogeneous whole with common ideals and customs. Mr. Taft pointed out a step vital to the reduction of lawlessness when he declared in 1908: "The administration of criminal law in this country is a disgrace to our civilization. The prevalence of crime and fraud, which here are greatly in excess of that in European countries, is due largely to the failure of the law and its administration to bring criminals to justice." He added: "Felonies are bound to increase unless the criminal laws are enforced with more certainty, more uniformity, and more severity than they are now." Mr. Taft proved himself a prophet, for in the fourteen years since he uttered those words major crimes have increased by leaps and bounds.

The real cure for our lawlessness rests with the hearts and consciences of the American people. When they are convinced that disrespect for law has become such a disease in the body politic that it must be cured, the battle will be won, but until that day dawns we are doomed to present to the world a worse and worse spectacle of lawlessness.

FLOODS THAT SERVE AND DESTROY

A RIVER
OF WOOD
IN BRITISH
COLUMBIA

The picture was made immediately after the spring thaw, when the great mass of logs which had been cut during the winter was being carried down the stream to the lumber mills

LOOKING DOWN ON THIRTY CENTURIES

PREHISTORIC RUINS OF STONEHENGE AS SEEN FROM AN AIRPLANE

Widely differing conjectures have been made as to the purpose and origin of these huge monoliths. Nennius in the ninth century asserted that Stonehenge was erected to commemorate the slaughter of four hundred nobles by Hengist. The Welsh bards tell us that it was erected by the incantations of Merlin, who brought the stones from Ireland. The best of modern opinion agrees that it is a sun temple of the bronze age. The time of its erection has been calculated as about 1680 B.C., from the fact that on this approximate date the midsummer sun would have risen on a direct line with the axis of the temple.

POSTMASTER- GENERAL HUBERT WORK INSPECTING A NEW RADIO OUTFIT FOR AIRCRAFT

Dr. Work (right foreground) is seen at Bolling Field Air Station, at Washington, and before him is a radio outfit which is to be installed on a mail-carrying airplane. This is the first time, it is announced, that the Post Office Department has utilized radio in connection with the air mail service. The two pictures on this page suggest the thought that perhaps a mere matter of thirty centuries is all that has saved Postmaster-General Work from becoming a sun god. Nothing less could have resulted from dropping down at Stonehenge in the time of its heyday with the radio apparatus which he is here shown inspecting.

RUSSIA'S FIFTY-BILLION BILL AND THE STORY OF AMERICA'S CLAIM FOR "INDIRECT DAMAGES" FIFTY YEARS AGO

BY WILLIS FLETCHER JOHNSON

IF anything could surpass the extravagance of Soviet Russia's claim against the Allied Powers of fifty billion rubles in gold as indemnity for the direct and indirect damages which that country is alleged to have suffered during and since the World War as results of their action, it would be her ineptitude in basing that claim, as she is said to do, upon the precedent set by the United States in its settlement of accounts with Great Britain after the Civil War. This will be obvious when we recall a chapter of history of fifty years ago, too much forgotten but pertinent to the present time; and it will also be obvious that Mr. Lloyd George acted in logical accord with the precedent of that former episode when he somewhat bluntly declared that if Russia persisted in making that claim there

would be no object in her continuing in the Genoa Conference.

It is quite true that there was a proposal by some Americans to demand an enormous sum of "indirect damages" from Great Britain. It is equally true that if it had actually been made and insisted upon Great Britain would have withdrawn from—if, indeed, she ever would have entered—the Geneva Arbitration; that the best sentiment in America was opposed to the suggestion; and that the only result of its making was a few years' delay in the settlement of the legitimate issues between the two countries.

As early as October, 1863, more than a year after the "escape" of the Alabama from Liverpool and the stopping of the Confederate ironclads from a similar "escape" by the stern warning, "This

means war," Charles Francis Adams, the American Minister to England, intimated to the British Government that this country would prefer claims against it for breaches of neutrality, and would be willing to submit them to any equitable form of arbitration. No reply was then made, but two years later, at the end of the war, the British Government specifically refused to submit the question of its liability for the Alabama's ravages to arbitration, because it held that its own law officers were the supreme interpreters of the British neutrality laws, though it was willing to join in the creation of a commission to which should be submitted such claims as it (the British Government) saw fit thus to receive for consideration. In this attitude Great Britain doubly erred, as some of her own statesmen have

frankly confessed: First, in ignoring the international law against which she had sinned as well as against her own neutrality laws; and, second, in declining to go into court unless she herself could determine what charges should and what should not be made. The result was that negotiations were for a time suspended.

A year later, however, the British Government reversed that unfortunate and indeed untenable attitude, and indicated its readiness to arbitrate the Alabama claims. Some delay was occasioned by Mr. Adams's retirement, but his successor, Reverdy Johnson, took up the matter where he had laid it down, and early in 1869 negotiated with Lord Clarendon a convention for the settlement of the Alabama claims and all other matters at issue.

It was when this treaty was laid before the Senate for ratification that the demand for "indirect damages" arose. The chief spokesman of that demand was Charles Sumner, who was then Chairman of the Foreign Relations Committee of the Senate. He took the ground that the British Government should be held responsible pecuniarily for all the indirect as well as direct losses which the United States had sustained in the war because of its conduct. If the Alabama had not been permitted to sail in the summer of 1862, he said, and if Great Britain had not permitted a Confederate loan to be subscribed, the war would have ended in 1863, instead of 1865. Therefore he held Great Britain responsible for the second half of the war, and insisted that she should be required to pay the entire costs of those two years, in round figures about two billion dollars. He made a strongly worded speech to that effect, and, although it was made in an executive or secret session of the Senate, he took pains to have it made public and as widely circulated as possible. Then, utilizing the intense partisan feeling against Andrew Johnson, who was then—after the futile attempt to impeach him—nearing the end of his term, Sumner rallied the Senate against the treaty, chiefly for the reason that it did not specifically provide for the arbitration of the "indirect damages." The result was that on April 13, 1869, the treaty was rejected by the overwhelming vote of 44 against it to only one cast in its favor.

Meantime Reverdy Johnson, warned by Seward that his treaty would be rejected, proposed to Lord Clarendon a modification of it so as to permit any claims whatever—even for "indirect damages"—to be laid before the Arbitral Commission, and then resigned his place as Minister, without waiting for a reply. There is little doubt that Clarendon would have refused the proposal. Certainly, as soon as Sumner's speech was read in London and the grounds on which the treaty was rejected were understood over there, an overwhelming official and popular sentiment arose

against any arbitration or other attempt at settlement; because, it was argued, America would demand the two billions of "indirect damages," and of course Great Britain would refuse to consider the claim, and so the conference would fail, and there was no use in entering a conference that was in advance doomed to failure. The case was made still worse when that fine historian but poor diplomat John Lothrop Motley was sent as Minister to Great Britain, for he shared Sumner's views, and intimated that unless the "indirect damages" were considered favorably there was little hope of improving relations between the two countries.

Fortunately, Motley was soon withdrawn. But even then it was necessary to wait for some time, until the passions aroused on both sides of the ocean by Sumner's fulminations had in a measure subsided. At last, early in 1871, a Canadian statesman, Sir John Rose, undertook what proved to be successful mediation. His efforts were, indeed, at first menaced by Sumner, who, when asked by the Secretary of State, Hamilton Fish, what treaty terms would be acceptable to the Senate, again insisted upon "indirect damages," and in a written memorandum prescribed as a *sine qua non* of settlement Great Britain's withdrawal from Canada and all other possessions in the Western Hemisphere! The sequel to that amazing demand, and in some degree its result, was a revolt in the Senate which removed Sumner from the Chairmanship of the Foreign Relations Committee and assured a more reasonable policy in that body. A little later Sumner voted for ratification of the Treaty of Washington, although it made no more provision for "indirect damages" than had the Johnson-Clarendon convention, against which he had thundered and which had been rejected by an all but unanimous vote.

Once more the boggy of "indirect damages" was conjured up. Soon after the first meeting of the Geneva Tribunal, in December, 1871, some malicious marplot, whose identity is matter of conjecture, gave currency in England to a report that Sumner's claims for two billion dollars and the withdrawal of the British flag from the Western Hemisphere were to be approved by the United States Government and would be insisted upon by it at Geneva as essential to a settlement. For this there was not of course the slightest foundation in fact. But the report created much excitement, disquiet, and indignation in England; both parties demanded that any such action be resisted, and the Cabinet seriously considered the propriety of asking the American Government for assurances that no such claims would be preferred at Geneva as a necessary condition to continuance of the conference. The British Foreign Minister told General Schenck, the American Minister, that his Government could not admit that it was within the province of the Geneva Tribunal to consider claims

for "indirect losses," and that statement was a few days later made in the Queen's Speech at the opening of Parliament. In the ensuing debate members of both parties insisted that no such claims should be admitted, though they spoke in a moderate and conciliatory tone, with the exception of William E. Gladstone, who fulminated furiously against the country for which at that time he had an intense animosity.

Sir Stafford Northcote brought matters to a head by saying publicly that he understood the American Commissioners to have promised that the indirect claims would not be made. This was repeated in Parliament and reported at Washington, and all the American Commissioners denied that any such promise had been made. Indeed, one of them, E. Rockwood Hoar, said that he had always understood that such claims were to be presented. A little later it was made clear that this apparent contradiction arose from a sheer misunderstanding. The American Commissioners realized the futility and worse of such claims, and wanted to drop them, but did not see how they could legally do so, seeing that they had been included in the presentation of the American case to the Tribunal. In order to give time for them to find a way out of the difficulty, the next meeting of the Tribunal was postponed from June 17 to June 19, 1872.

On the latter date the question was finally settled. Charles Francis Adams drafted a statement, which was unanimously adopted by the Tribunal, to the effect that, without expressing any opinion as to the difference over interpretation of the Treaty of Washington, the members of the Tribunal of Arbitration were individually and collectively convinced that claims for indirect damages did not, under international law, constitute a valid foundation for an award of compensation, and that therefore they must be wholly excluded from consideration by the Tribunal. That was the end of them. Nothing more was ever heard of indirect damages. And the Tribunal's award of \$15,500,000 was hailed with satisfaction and enthusiasm throughout the United States as a wholly adequate indemnity.

Such is the "precedent" upon which the Soviet triumvirs are reported to base their claim of fifty billion gold rubles. It will be perceived that it counts against, rather than for, their extravagant demand, while it does give sanction to Mr. Lloyd George's prompt condemnation of that claim as something that cannot be considered by the Genoa Conference. One of these days the world may decree as a heroic measure for the prevention of war that a nation responsible for starting a war shall be held accountable for all losses caused by that war, directly and indirectly. But that day is not yet; and even if it were, that principle would not give sanction and validity to this fantastic claim of Soviet Russia.

A YANKEE MOTHER IN ISRAEL

BY DOROTHY CANFIELD

OF course I never saw her. She died years before I was born. But she left behind her a portrait so full of her personality that no living figure is more human to me than my great-grandmother.

I do not at all refer to the portrait over the dining-room mantelpiece, showing her as a withered old woman in a frilled cap, which by the time I was old enough to take an interest in her was the only tangible sign of her existence left in her old home. No; that might have been any withered old woman in a frilled cap.

There is another portrait of my great-grandmother not done on canvas with oils. Here are some of the strokes which have painted it for me.

WHEN I was about eight years old, I went out one day to watch old Lemuel Hager, who came once a year to mow the grass in the orchard back of the house. As he clinked the whetstone over the ringing steel of his scythe, he looked down at me and remarked: "You favor the Hawley side of the family, don't you? There's a look around your mouth sort o' like Aunt Almera, your grandmother—no—my sakes, you must be her great-granddaughter! Wa'l—think of that! And it don't seem more'n yesterday I saw her come stepping out same's you did just now; not so much bigger'n you are this minute, for all she must have been sixty years old then. She always was the *littlest* woman. But for all that she marched up to me, great lummoxy of a boy, and she said, 'Is it true, what I hear folks say, Lemuel, that you somehow got out of school without having learned how to read?' And I says, 'Why, Mis Canfield, to tell the truth, I never did seem to git the hang of books, and I never could seem to git up no sort of interest in 'em.'

"And she says back, 'Well, no great boy of eighteen in the town I live in is a goin' to grow up without he knows how to read the Declaration of Independence,' says she. And she made me stop work for an hour—she paid me just the same for it—took me into the house, and started teaching me. Great land of love! if the teacher at school had 'a' taught me like that, I'd 'a' been a minister! I felt as though she'd cracked a hole in my head and was just pouring the l'arning in through a funnel. And 'twasn't more'n ten minutes before she found out 'twas my eyes the trouble. I was terrible near-sighted. Well, that was before the days when everybody wore specs. There wa'n't no way to git specs for me; but you couldn't stump Aunt Almera. She just grabbed up a sort of magnifying-glass that she used, she said, for her sewing, now her eyes were kind o' falling her, and she give it

to me. 'I'll take bigger stitches,' says she, laughing; 'big stitches don't matter so much as reading for an American citizen.' Well, sir, she didn't forgit me; she kept at me to practice at home with my magnifying-glass, and it was years before I could git by the house without Aunt Almera come out on the porch and hollered to me, 'Lemuel, you come in for a minute and let me hear you read.' Sometimes it kind o' madded me, and sometimes it made me laugh, she was so old, and not much bigger'n my fist. But, by gol, I l'arned to read, and I have taken a sight of comfort out of it. I don't never set down in the evening and open up the Necronsett 'Journal' without I think of Aunt Almera Canfield."

ONE day I was sent over to Mrs. Pratt's to get some butter, and found it just out of the churn. So I sat down to wait till Mrs. Pratt should work it over, munching on a cookie out of her cookie jar and listening to her stream of talk—the chickens, the hail-storm of the other day, had my folks begun to make currant jelly yet? and so on—till she had finished and was shaping the butter into beautiful round pats. "This always puts me in mind of Aunt Almera," she said, interrupting an account of how the men had chased a woodchuck up a *tree*—who ever heard of such a thing? "Whenever I begin to make the pats, I remember when I was a girl working for her. She kept you right up to the mark, I tell you, and you ought to have seen how she lit into me when she found out some of the pats were just a little over a pound and some a little less. It was when she happened to have too much cream and she was 'trading in' the butter at the store. You'd have thought I'd stolen a fifty-cent piece to hear her go on! 'I sell those for a pound; they've got to be a pound,' says she, the way she always spoke, as though that ended it.

"'But, land sakes, Mis Canfield,' says I, 'an ounce or two one way or the other—it's as likely to be more as less, you know! What difference does it make? Nobody expects to make their pats just a pound! How could you?'

"'How could you? How could you?' says she. 'Why, just the way you get anything else the way it ought to be—by keeping at it till it is right. What other way is there?'

"I didn't think you could, I *knew* you couldn't; but you always had to do the way Mis Canfield said, and so I began grumbling under my breath about bossy, fussy old women. But she never minded what you *said* about her, so long as you did your work right, and I fussed and fussed, clipping off a little, and adding on a little, and weighing it between times. It was the awfulest bother you

ever saw, because it spoiled the shape of your pat to cut at it so much, and you had to do it over again every time. Well, you wouldn't believe it, how soon I got the hang of it! She'd made me think about it so much, I got interested, and it wasn't any time at all before I could tell the heft of a pat to within a hair's breadth just by the feel of it in my hand. And I never forgot it. You never do forget that kind of thing. I brought up my whole family on that story. 'Now you do that spelling lesson,' I'd say to my Lucy, 'just the way Aunt Almera made me do the butter pats!'"

I WAS sitting on the steps of the Town Hall, trying to make a willow whistle, when the janitor came along and opened the door. "The Ladies' Aid are going to have a supper in the downstairs room," he explained, getting out a broom. I wandered in to visit with him while he swept and dusted the pleasant little community sitting-room where our village social gatherings were held. He moved an armchair and wiped off the frame of the big portrait of Lincoln. "Your great-grandmother gave that, do you know it?" he observed, and then, resting on the broom for a moment and beginning to laugh, "Did you ever hear how Aunt Almera got folks stirred up to do something about this room? Well, 'twas so *like* her! The place used to be the awfulest hole you ever saw. Years ago—oh, *years* ago, before there was a good county jail—they'd used it to lock up drunks in, or anybody that had to be locked up. Then after that the sheriff began to take prisoners down to the new jail. But nobody did anything to the room—it belongs to the town, you know, and nobody ever'll do anything that they think they can put off on the town. The women used to talk about it—what a nice place 'twould be for socials, and how 'twould keep the boys off the streets, and how they could have chicken suppers here, same as other towns, if this room was fixed up. But whose business was it to fix it up? The town's of course! And wa'n't the selectmen shiftless because they didn't see to it! But of course the selectmen didn't have the money to do anything. Nothing in the law about using tax money to fix up rooms for sociables, is there? And those were awful tight times, when money came hard and every cent of tax money had to be put to some good plain use. So the selectmen said *they* couldn't do anything. And nobody else would, because it wasn't anybody's business in particular, and nobody wanted to be put upon and made to do more than his share. And the room got dirtier and dirtier, with the lousy old mattress the last drunk had slept on right there on the floor in the corner,

and broken chairs and old wooden boxes, and dust and dry leaves that had blown in through the windows when the panes of glass were broken—regular dumping-ground for trash.

"Well, one morning bright and early—I've heard my mother tell about it a thousand times—the first person that went by the Town Hall seen the door open and an awful rattling going on. He peeked in, and there was little old Aunt Almera, in a big gingham apron, her white hair sticking out from underneath a bandanna handkerchief, cleaning away to beat the band. She looked up, saw him standing and gaping at her, and says, just as though that was what she did every day for a living, 'Good-morning,' she says. 'Nice weather, isn't it?'

"He went away kind of quick, and told about her over in the store, and they looked out, and sure enough out she come, limping along (she had the rheumatism *bad*) and dragging that old mattress with her. She drug it out in front to a bare place, and poured some kerosene on it and set fire to it; and I guess by that time every family in the street was looking out at her from behind the window-shades. Then she went back in, leaving it there burning up, high and smoky, and in a minute out she came again with her dustpan full of trash. She flung that on the fire as if she'd been waiting all her life to have the chance to get it burned up, and went back for more. And there she was, bobbing back and forth all the fore part of the morning. Folks from the Lower Street that hadn't heard about it would come up for their mail, and just stop dead, to see the bonfire blazing and Aunt Almera limping out with maybe an old broken box full of junk in her arms. She'd always speak up just as pleasant and gentle to them—that made 'em feel queerer than anything else, Aunt Almera talking so mild! 'Well, folks, how are you this morning?' she'd say. 'And how are all the folks at home?' And then *slosh!* would go a pail of dirty water, for as soon as she got it swept out, didn't she get down on her creaking old marrow-bones and scrub the floor! All that afternoon every time anybody looked out, splash! there'd be Aunt Almera throwing away the water she'd been scrubbing the floor with. Folks felt about as big as a pint-cup by that time, but nobody could think of anything to do or say, for fear of what Aunt Almera might say back at them, and everybody was always kind o' slow about trying to stop her once she got started on anything. So they just kept indoors and looked at each other like born fools, till Aunt Almera crawled back home. It mighty nigh killed her, that day's work. She was all crippled up for a fortnight afterwards with rheumatism. But you'd better believe folks stirred around those two weeks, and when she was out and around again there was this room all fixed up just the way 'tis now, with furniture, and the

floor painted, and white curtains to the windows, and all. Nobody said a word to her about it, and neither did she say a word when she saw it—she never was one to do any crowing over folks."

THE hassocks in our pew began to look shabby, and my aunt brought them home from church to put a fresh cover of carpeting on them. They suggested church, of course, and as she worked on them a great many reminiscences came to her mind. Here is one: "I used to love to ride horseback, and grandmother always made father let me, although he was afraid to have me. Well, one summer evening, right after supper I went for a little ride, and didn't get home till about half-past seven. As I rode into the yard I looked through the open windows, and there was grandmother putting her bonnet on; and it came to me in a flash that I'd promised to go to evening prayers with her. I was a grown-up young lady then, but I was scared! You did what you'd promised grandmother you would, or something happened. So I just fell off my horse, turned him out in the night pasture, saddle and all, and ran into the house. Grandmother was putting on her gloves, and, although she saw me with my great looped-up riding skirt on and my whip in my hand, she never said a word nor lifted an eyebrow; just went on wetting her fingers and pushing the gloves down on them as though I was ready with my best hat on. That scared me worse than ever. I tore into my room, slipped off my skirt, put on another right over my riding trousers, slammed on a hat, threw a long cape around me, and grabbed my gloves. As the last bell began to ring and grandmother stepped out of the house, I stepped out beside her, all right as to the outer layer, but with the perspiration streaming down my face. I'd hurried so, and those great thick riding trousers were so hot under my woolen skirt! My! I thought I'd die! And it was worse in the church! Over in our dark, close corner pew there wasn't a breath of air. It must have been a hundred by the thermometer. I was so hot I just had to do something or die! There weren't but a few people in the church, and nobody anywhere near our corner, and it was as dark as could be, back in our high pew. So when we knelt down for the General Confession I gathered the cape all around me, reached up under my full skirt, unbuttoned those awful riding trousers, and just cautiously slipped them off. My! What a relief it was! Grandmother felt me rustling around and looked over sharp at me, to see what I was doing. When she saw the riding trousers, she looked shocked and frowned; but I guess I must have looked terribly hot and red, so she didn't say anything. Well, I knew it was an awful thing to do in church, and I was so afraid maybe somebody *had* seen me, although old Dr. Skinner, the rector, was the only one high enough up to look over the pew-

top, and he was looking at his Prayer-Book. But I felt as mean as though he'd been looking right at me. Well, he finally got through the prayers and began on the First Lesson. It was something out of the Old Testament, that part about how the Jews went back and repaired the ruined walls of Jerusalem, each one taking a broken place for his special job, and then how they got scared away, all but a few, from the holes in the walls they were trying to fix up. Dr. Skinner always read the lessons very loud and solemn, as though he were reading them right at somebody, and he'd sort of turn from one to another in the congregation with his forefinger pointed at them, as if he meant that just for them. What *do* you suppose I felt like when he turned right towards our corner and leaned 'way over and shook his finger at me, and said in a loud, blaming tone, 'But Asher continued and *abode* in *his* breaches!' I gave a little gasp, and grandmother turned towards me quick. When she saw the expression on my face (I guess I must have looked funny), she just burst right out into that great laugh of hers—ha! ha! ha! She laughed so she couldn't stop, and had to actually get up and go out of church, her handkerchief stuffed into her mouth. We could hear her laughing as she went down the walk outside!

"You'd have thought she'd be mortified, wouldn't you? I was mortified almost to death! But she wasn't a bit. She laughed every time she thought of it, for years after that. It was just like her! She did love a good laugh! Let anything happen that struck her as funny, and she'd laugh, no *matter* what!"

Later on, as we carried the hassocks back to the church and put them in our pew, my aunt said, reflectively, looking round the empty church: "I never come in here that I don't remember how grandmother used to say the Creed, loud and strong—she always spoke up so clear: 'From thence he shall come to judge the quick and the dead. I believe in the Holy Ghost: The Holy Catholic Church: The Communion of Saints: The Forgiveness of sins—' and then she'd stop dead, while everybody went on, 'The Resurrection of the body;' and then she'd chime in again, 'And the Life everlasting, Amen.' You couldn't help noticing it, she took the greatest pains you should. But she always said, if anybody said anything about it, that she didn't believe in the resurrection of the body, and she wasn't going to say she did. Sometimes the ministers would get wrought up, and one of them went to the bishop about it, but nobody ever did anything. What *could* you do? And grandmother went right on saying the Creed that way to the day of her death."

ONCE I was taken to see an old Irish woman who had come, as a young girl, from Ireland just after the great famine in '48, and had gone to work for

great-grandmother, who was then sixty-three years old. She told me this story, in her thick, thick early-nineteenth-century brogue, which I will not try to reproduce here: "There was a pretty girl, young and happy-looking, that lived up the road with her father, a poor weak rag of a man with a backbone like a piece of string, and with her stepmother, a hard woman, her heart made of a flintstone. And when they found out the girl was in trouble, and her sweetheart that was the cause of it off up in the North Country for the winter to work as a lumberjack, didn't they turn the poor girl out—yes, out like a dog. And old Mrs. Canfield—that was some kin to you, I forget what—where I was working, she went right out and brought her in, and kept her there safe and sound all winter, treating her as nice as anybody, letting her sew to pay for her keep, and helping her make the baby clothes. She'd go with her to church every Sunday, the girl right on her arm, and nobody daring to say a word, for fear of old Mrs. Canfield's tongue. 'For,' she used to say, 'let 'em say a word if they dare, and I'll tell a few things I know about some folks in this town who had to be married in a hurry, and whose babies came into the world ahead of time.' You see, she was so old she knew everything that had happened from the beginning almost. She'd say, 'There's lots worse things done every day in this town,' she'd say, and nobody to answer her back a word.

"But behind her back everybody was thinking it very certain that the man would never come back, and if he did, he'd never own the child, nor have anything to do with Margaret, poor girl! You see, in those days there weren't any mails that were carried 'way back off in the woods, and she neither had any word of him nor he of her. Well, old Mrs. Canfield knew what they were saying all right—she knew what everybody was saying—and I could see that she was troubled in her mind, though she never lowered her high head by an inch. Margaret's time drew near, and no sign from John Dawson, that was away. But Margaret never lost her faith in him a minute. 'When John is back,' she'd say, just as sure of him as though they'd been married by the priest; but I could see old Mrs. Canfield look queer when she'd hear Margaret talking that way.

"And then one morning, in April 'twas, and we'd all the doors and windows open for the first time, Margaret had gone down the walk to look at the lilac bush to see if there were any buds on it, and around the corner came John Dawson!

"Her back was to him and he hadn't any idea she was there, so when she turned round, they stared at each other for just a minute, as if they'd never seen each other. Margaret stood there, just frozen, now the moment had come, just waiting like a little scared, helpless—I had the half of me hanging out the kitchen window to see what would hap-

pen, and I'll never forget it—never—never—never—the look on his face, the astounded look on his face, so full of pity and love, so strong with pity and love. 'Margie! Margie!' he said in a loud voice, and threw his sack off his back and his gun from his hand, and ran, ran to take her in his arms, so gentle, so strong.

"Well, when I could see again, I went off to tell old Mrs. Canfield, and there was the old lady in her own bedroom, standing bolt upright in the middle of the floor, and crying at the top of her voice. Her wrinkled old face was just a-sop with tears. Faith, but it was the grand cry she was having! And the good it did her! When she came to, she says to me, 'Well,' says she, 'folks aren't so cussed as they seem, are they?'

"And then we went downstairs to get out the fruit-cake and the brandied peaches; for the minister married them in our parlor that afternoon."

ONE day old Mr. Morgan, the one-armed Civil War veteran, took me along with him, to get out of the buckboard and open gates, on the back road along the river. He was going up to a hill pasture to salt his sheep. It took forever to get there, because his horse was so slow, and he had time to tell me a great many stories. This was one of them: "When I was a boy at school, I worked at Aunt Almera Canfield's doing chores night and morning. I remember how she used to loosen herself up in the morning. She was terribly rheumatically, but she wouldn't give in to it. Every morning she'd be all stiffened up so she couldn't stand up straight, nor hardly move her legs at all; but she'd get herself dressed somehow, and then two of her sons came in to help her get started. She'd make them take hold of her, one on each side, and walk her around the room. It was awful to hear how she'd yell out—yell as though they were killing her! And then they'd stop, the sweat on their faces to see how it hurt her, and then she'd yell at them to go on, go on, she hadn't asked them to stop! They were over sixty, both of them, with grandchildren themselves, but they didn't dare not do what she said, and they'd walk her round again. She'd kick her poor legs out in front of her hard, to get the joints limbered up, and holler with the pain, and kick them out again, till by and by she'd get so she could go by herself, and she'd be all right for the day. I tell you, I often think of that! Yes, lots of times, it comes back to me."

Up in the sheep pasture, as we sat to rest the horse, he told me this: "I always thought Aunt Almera knew all about the John Brown raid before most folks did—maybe she sent some money to help him. She wasn't a bit surprised, anyhow, when she heard of it, and all through the whole business she never thought of another thing, nor let anybody else. He was caught—any of us

that lived in that house those days will never forget a one of those dates—and put in jail on the 9th of October, and his trial lasted until the 31st. Aunt Almera made us get together in the evenings, me and the hired girl and one of her grandsons and her daughter, all the family, and she'd read aloud to us out of the 'Tribune' about what had happened that day at his trial. I never saw her so worked up about anything—just like ashes her old face was, and her voice like cold steel. We got as excited about it as she did, all of us, especially her grandson, that was about my age, and when we knew he was going to be hanged—and the day of his execution—December 2d, it was—Aunt Almera came at dawn to wake me up. 'Put on your clothes,' says she, 'and go over to the church and begin to toll the bell.' I didn't need to ask her what for, either. I'll never forget how awful she looked to me.

"Well, we tolled the bell all day long, one or the other of the family, never stopped a minute. You never heard anything so like death. All day long that slow, deep clang—and then a stillness—and then *clang!* again. I could hear it in my head for days afterwards. Folks came in from all around to find out what it meant, and Aunt Almera called them all into her parlor—she sat there all day and never ate a mouthful of food—and *told* them what it meant, so they couldn't ever get the sound of her voice out of their ears. Between times she'd read to whoever was there out of the Bible, in a loud voice, 'Avenge thou thy cause, O Lord God of battles,' and 'It is time for thee, O Lord, to lay to thy hand, for they have destroyed thy law,' and 'Let there be no man to pity them; nor to have compassion of their fatherless children.' It was the darndest thing to hear her!

"You'd better believe when the first call for men came from Washington there wasn't a boy of military age in our town that didn't enlist!"

AN old, old cousin had just died, and as we sat downstairs talking with the doctor, he said to my aunt, who had been taking care of the sick woman: "She took it hard! She took it hard!"

They both frowned, and my aunt looked rather sick. Then the doctor said, "Not much like your grandmother, do you remember?" "Oh, yes, I remember," said my aunt, her face quivering, her eyes misty, her lips smiling. The doctor explained to me: "Your great-grandmother was an old, old woman before she ever was really sick at all, except for rheumatism. And then she had a stroke of paralysis that left her right side dead. She lived four days that way—the only days she'd spent in bed in years, since she was a young woman. I suppose. Her mind wasn't very clear, she couldn't talk so that we could understand her, and I don't think she rightly knew anybody after her stroke. I guess she went back, 'way back, for we saw

from what she did that she thought she had a little baby with her. I suppose she thought she was a young mother again, and that was why she was in bed. She'd spread out her arm, very gentle and slow, the only arm she could move, so's to make a hollow place for a little head, and then she'd lie there, so satisfied and peaceful, her face just shining as if she felt a little warm, breathing baby there. And sometimes she'd half

wake up and stretch out her hand and seem to stroke the baby's head or snuggle it up closer to her, and then she'd give a long sigh of comfort to find it there, and drop off to sleep again, smiling. And she'd always remember, even in her sleep, to keep her arm curved around so there'd be room for the baby; and even in her sleep her face had that shining love on it—that old wrinkled face, with that look on it! I've seen

lots of death-beds, but I never—" he stopped for a moment.

"Why, at the very last—do you remember?"—he went on to my aunt, "I thought she was asleep, but as I moved a chair she opened her eyes quickly, looked down as if to see whether I had wakened the baby, and looked at me, to warn me to be quiet, her finger at her lips, 'Sh!' she whispered.

"And that was the way she died."

NOON

BY JOHN HALL WHELOCK

At noon I watched
In the large hollow of eternal heaven
A soaring hawk climb slowly toward the sun
Upward, in adoration without end.
His flight was a great prayer.

OLD CHINOOK SURPRISES THE PARSON

BY PEARSE PINCH

I MET "Old Chinook" from away out West the other day, right here on the streets of Washington. Somehow I vaguely sensed his presence before he appeared, as I used to do out West. There he would come softly whistling or humming an air from one of the great operas, learned he would never tell where. I think he must have been whistling along the street the day I met him. We called him "Chinook" because, like that famous wind, he used to arrive so unexpectedly, and the frost lost its grip on everything at his coming. His jubilant greeting the other day drove the chill from the air, and spring seemed to be here in full tide.

"Well, Parson," he exclaimed, "where on earth did you come from, and how came you here?"

We were soon up to our ears in question and answer as to what had befallen each since the day our trails parted out there in Wyoming. "What are you doing?" he asked. "Still preachin', or workin' for Uncle Sam?"

"Preaching," I answered. "That's my work; and I could hardly do anything else, if I would; and wouldn't, if I could."

"I s'pose so," he replied. "But don't you get awfully tired of it sometimes?"

"Why should I?" I questioned in turn.

"Oh, I w's just thinkin'." Then, with a sudden turn, he seemed to be off on another tack. "By the way," he said, "how many railways run out to that town where you're preachin'?"

"Only one," I informed him, "and that is all the traffic would sustain."

"Why don't you have half a dozen?" he asked.

"Why should we," I asked, "when one barely pays?"

"Well, you see," he answered, "there are so many ways of building and running railways that every community, it

seems, ought to have the advantage of them all."

"Why, man, what do you mean?" I asked. "What are you driving at, anyway?"

I knew he had something up his sleeve which he was taking a round-about way, not uncommon with him, to produce.

He went on: "You see, there are the several kinds of power. Some like the old way, of running cars by steam. They think it more reliable, like other old things. Others like the trolley, because the cars can run oftener, and accommodate passengers any hour of the day. You know that road of ours out West? Well, they are burning oil on that branch, and nothing else. I met an old fellow up the river who is always recalling the time when the engines had nothing but wood, and he thought it more homelike than any of these new-fangled ways."

"But," I said, "all of that would be no reason for building a half-dozen roads out to our place."

"There are other things to consider," he persisted. "There are different styles in building cars. There are different kinds of platforms to get in on. There's no end of variety in choice of routes. One road could follow the hills, and another the valleys. Some folks are never happy unless they can be riding somewhere within sight of bodies of water."

I thought I began to see the direction of Chinook's parable, but to further call him out I began a protest against the whole idea.

"You know perfectly well, Chinook," I said, "that you are talking nonsense. As it is, our road is well patronized. The cars are well filled, and often crowded. A whole neighborhood of commuters ride together, and it makes a big

neighborhood sociable between our town and Washington morning and night, as cheerful and friendly a crowd as you ever saw. The road, I understand, is fairly prosperous. But if we had five or six roads, they would divide the crowd into sorry little handfuls, some becoming partisans of one road, and some of another. It would all tend to breed neighborhood dissension. As a business policy it would be suicidal, and every road would be bankrupt. I can't imagine anything more senseless."

"I know something more senseless," Chinook replied.

"In the name of all that's foolish, what is it?" I asked.

"The policy of the churches; for they are doing worse than the thing you describe as so disastrous in railroading. That's why I wondered if you don't get awfully tired of preachin'."

Chinook's parable had me tight. I confessed that the policy of our churches is a grievous trial to any man who wants to be a preacher and still be a man.

"And yet," I protested, "things will never become any better if those of us who want another policy abandon the field and leave it to the partisans who want nothing but division. I try to make my church broad enough to include all who want a larger type of Christian life."

"No chance, Parson," replied Chinook.

"Folks seem to like narrow and partisan ways in everything. I don't know that they are any worse in religion than in other things; but somehow it looks smaller and more contemptible in religion; and they are smaller and more contemptible when they are narrow and partisan in a thing so big as religion. You may as well give it up, Parson, and come back with me into God's great big churchless outdoors."

SIR ARTHUR CONAN DOYLE

BY VILHJALMUR STEFANSSON

(C) Paul Thompson

SIR ARTHUR CONAN DOYLE, LADY DOYLE, AND THEIR CHILDREN LOOKING AT NEW YORK CITY FROM THE ROOF OF THE AMBASSADOR HOTEL

THE years when Conan Doyle was not as yet my hero are faint in the mists of childhood. At first he was Sherlock Holmes, tall and slender, stooped, with keen features and nervous hands (like William Gillette's, which I was not to see on the stage for two decades). From my fellow-cowboys I used to hear tales of Buffalo Bill, who had been their associate and who fitted into our life, for he was indeed part of it. But Sherlock Holmes was equally real to me, though he belonged to the strange world of hansom cabs and street lamps seen hazily through a drizzling rain, which, somehow, I imagined could not at all resemble the drizzle that soaked me to the skin as I rode herd. To me Sherlock Holmes was a vivid, resilient figure moving through a blurred, unreal London—unreal so far as concerned St. Paul's or the Tower, though I could always see a cameo face at the window of the one substantial house of a gossamer city, No. 221 Baker Street.

It was Sherlock Holmes that was real; his pen-name was Conan Doyle.

Sherlock Holmes was my hero because he was not handsome and muscular and stupid like the knights of the mediæval romances that were then coming into fashion. In him the body was incidental to the mind. He fought with a weapon keener than steel, the one weapon (as I then thought) of the future. At that and in my next stage of development I saw no excitement (but great anthropological interest) in a football game—a pageant, I conceived it, of

our caveman ancestry. My thrills were in debate and in chess. The reign of brute force was over and the intellect had come to rule. That idea did not leave my head till 1914. I am not fully over it yet, for I sometimes think brains may have had something to do with winning the war.

While still a college student I worked my way over to Europe. Had I been able to cross two years earlier, I should probably have made a pilgrimage to many literary shrines, among them Stratford and "The Abbey." When I did get across, I had a notion to visit the Doone country, but the only shrine I actually searched for was 221 Baker Street. Of course it was not there. The absence of the house made the tenant more real, through relief from a suspense not acknowledged. One feels so much better about the gods if they are in the sky and not perched on a hill like Olympus. They are so much safer in the sky.

Now that 221 Baker Street had through its absence relieved me of my one (unconscious) misgiving about Sherlock Holmes, I forgot any curiosity I might have had about Conan Doyle. For I could feel the nearness of Holmes (who was Doyle) in every crowded street. Especially in fogs and at night he peered at me out of passing hansoms and stepped aside to let me pass through dark and narrow alleys. Why should I search for a man who brushed against me in every crowd? Busy as he was, why should I bother him? So I went from theater to theater seeking instead

I knew not what. At last I found Bernard Shaw and a statement, if not a solution, of the Irish question in what is still my favorite Shaw play—"John Bull's Other Island."

It was on my third visit to England that a friend of mine who was a friend of Doyle's took it upon himself to bring us together. I have heard this friend tell that I wanted to meet Doyle because I thought him the greatest man in England. That was not my point of view. I have not thought deeply nor analytically about who may be the greatest man in England. What I felt was that, apart from the friends I knew well enough to need no exchange of words with them to find them good company, there was but one personality I realized in England—Sherlock Holmes, who as yet was Conan Doyle.

But when I first met Conan Doyle he was Dr. Watson. This was a hard trial for Sherlock Holmes. A personality less individual than his would have lost ground. To him it gave added strength. On coming to the top of Olympus I realized that I had always subconsciously known that the gods would not be visible to a casual eye. No real gods would be. Invisibility is an attribute of the godhead, to the disciple a precious sign confirming his belief.

Not merely at first was Conan Doyle Dr. Watson. He still is. But Sherlock Holmes has gradually asserted himself. Dr. Watson's kindness, his unselfish way of refusing to take the center of the stage, his generous interest in friends and mere people and in simple things (even in the weather), at first make him appear as a single personality. But he is really a composite personality, and you presently catch the analytic mind of Holmes peering out at you. The penetration he applies to his problems in crime is focused, and you feel that he reads legible upon the innermost walls of your mind things that even you did not know were there. Still, Sherlock Holmes under these conditions seems to suffer a strange astigmatism, for when he looks at you through the kind eyes of Conan Doyle he sees little but the good. Your weaknesses and wickednesses have to be pretty conspicuous if he sees them at all.

At his home Conan Doyle is not merely a sturdier Watson and a kinder Holmes. He is also a gentler Sir Nigel and a mellow blend of all the host of his nobler characters. Lady Doyle, Denis, Malcolm, and wistful little "Billy" are there in appropriate settings as proxies for the fair ladies, sturdy lads, and dainty little maidens of his wholesome books.

But to Sir Arthur this is not his whole family. His son Kingsley fought without serious hurt through more than

half the war. Then, because he had been a medical student and surgeons were needed at the front, he was sent back to England to his studies and to his death from pneumonia. Some time after that, with a conventional outlook and a literal acceptance of the formula "dust to dust," I came into a family where Kingsley still occupied a place no less than Malcolm and Denis, and I gradually learned to adjust myself

to a new relation between those who are living and those who are called dead.

Sir Arthur Conan Doyle is now in America to preach the gospel which enables Kingsley to keep his place as a loved member of the family at the side of his brothers and sisters. Sir Arthur is a better spokesman for himself and for his case than any of us who are his devoted friends. He will probably ad-

dress himself to his audience with such direct simplicity that there will be no ovations: Let us hope, for our sakes rather than his, that we listen with the attention given Paul at Athens. He speaks with the same sincerity, with the same conviction, that he brings a new revelation of truth and power.

His plea is only the plea of Paul: "Prove all things. Hold fast that which is good."

THE SENATOR FROM PENNSYLVANIA

AN ESTIMATE OF GEORGE WHARTON PEPPER

BY AGNES REPPLIER

IF Mr. George Wharton Pepper be re-elected to the United States Senate, he will refute the emasculated creed that political life is a strong but dirty current, unfit for clean swimmers. This creed, subscribed to for the most part out of sheer apathy, has robbed the Republic of thousands of her ablest sons. They have held back, fearing rough contact and possible contamination. They have considered honor and honesty to be private luxuries which must be safeguarded from the public need.

Mr. Pepper has much to give and little to get in offering his services to his country. A lawyer of distinction, he has achieved success in his profession as the reward of engrossing toil. Since the year 1889, when he was graduated from the Law School of the University of Pennsylvania, class orator, and winner of the Sharswood prize and of the Pemberton Morris prize, his life has been one of strenuous endeavor. In the year of his graduation he published "The Border Land of Federal and State Decisions;" in 1891, "Pleading at Common Law under the Codes;" in 1901, "Digest of the Laws of Pennsylvania." For four years he edited the "American Law Register and Review." He is general counsel for the Penn Mutual Life Insurance Company, the Philadelphia Trust Company, and the Philadelphia National Bank. He possesses that accurate knowledge of code and Constitution which is of inestimable service in public affairs. His examination of witnesses before the Congressional Joint Committee in the Ballinger-Pinchot case was so masterly as to attract general attention. He displayed on this occasion an extraordinary skill and a steady self-control combined with that certainty of information which is particularly comforting to his clients.

When Mr. Root lamented that "democracies are always in trouble," he understood the perils of a representative system which depends upon rationality as well as upon liberty, upon wisdom in choosing no less than upon freedom of choice. Some measure of responsibility for his country's well-being rests with every voter. He casts his ballot uncon-

cernedly, as if it didn't matter in the least; but it is he who wins the reward of his wisdom or who pays the penalty of his errors. There have been times when the persistent election of incapable legislators has so reduced the level of the Nation's efficiency that the American citizen could only shrug despairing shoulders and say with the British soldier: "It's comfortable feeling as 'ow you're so wet that you can't get no wetter no'ow." There have been times—few and far between—when the courage and sanity of American lawmakers have arrested the attention of the world. The resources of our manhood are as limitless as the resources of our mines and farm lands; but much is lost by misdirection. "If citizens will not elect able and honest men as their agents," says ex-Senator Beveridge, "they must suffer the consequences of their indifference to their own welfare."

The influence and authority of the Senate have increased immeasurably during the last decade. More than one observer has pointed out that, while the House has declined until it is a negligible factor, the Senate waxes stronger every year. The struggle between the legislative bodies and the Executive, the unconcealed hostility which nullifies where it should construct and thwarts where it should amend, is not particularly helpful to the Nation. We are just as tired of war in Washington as of war in Europe. We want peace, and a rational understanding, and mutual concessions, and the triumph of common sense.

Therefore—the Senate being all-powerful—it is well to think soberly before electing a Senator. Therefore a moiety of Pennsylvanians have in mind a man of grave serenity, disciplined intellect, and balanced judgment, who can be trusted—having been already tried—not to go off his head when the first volley of words is fired. A knowledge of law has saved him from grave blunders, a knowledge of the world from the hopeless sentimentalism which alternates with selfish greed. It sometimes seems as though Congress ceases to be illiberal only when it has a chance of becoming

sentimental, and it is hard to say which mood is more injurious to the Nation. Mr. Pepper may be said to represent the type of mind which Mr. Henry Adams (a man not lavish of praise) recognized in his day as characteristically Pennsylvanian and credited with good working qualities: "In practical matters it is the steadiest of all minds; perhaps the most efficient; certainly the safest."

The practicality of a lawyer's mind is touched on every side by abstract considerations. Mr. Pepper's relations to labor illustrate this point. He has more than once represented the contractors in equity suits to restrain secondary boycotts, and the decisions then obtained have been accepted by union workers. On the other hand, he refused a retainer from the Merchant Tailors Association when he believed the union to be within its rights. And he mediated successfully in the Kensington textile strikes when there was ground for common agreement. One year's hard work he devoted to the Committee on Constitutional Revision, paying his own expenses in Harrisburg and gaining little but the pleasure of accomplishment. In this case, as in others, it might have been said of him, "His service was in the endeavor only, and not in the fruits thereof."

In the direful autumn of 1914, when Americans, aghast and bewildered, were swayed alternately by generous indignation and a demoralizing sense of security, Mr. Pepper refused once and for all to be morally anesthetized. He advocated a National protest against the violation of Belgium's neutrality, and the severance of diplomatic relations with Germany in the event of the protest being disregarded. This was not a popular stand to take. It ran counter to a long-cherished policy of non-interference, and it threatened vexation and internal discord. "Keep out of trouble," was the prevailing sentiment. The devout talked about peace, the cynical talked about profits; both concurred in denying any responsibility for the assaulted decencies of civilization.

There were men, old and young, to whom acquiescence in evil was an intel-

(C) Harris & Ewing

GEORGE WHARTON PEPPER, SENATOR FROM PENNSYLVANIA

lectual impossibility. Mr. William Dean Howells, Dr. Lyman Abbott, Dr. W. W. Keen, flamed with a noble anger which swept them back half a century to their lost youth. Theodore Roosevelt voiced the shamed manhood of the Nation. Mr. Pepper, too generous to enjoy an ignoble safety and too far-sighted to believe it could be permanently trusted to the hard-pressed armies of France and Eng-

land, watched with concern Germany's deepening hostility, and gave his active support to Major-General Leonard Wood's campaign of preparedness. He enrolled for training in Plattsburg. He was color sergeant of the First Provisional Regiment in 1915, and sergeant in Company H of the Ninth Regiment in 1916. In the welter of emotions evoked by sudden and vast calamity, this Phila-

delphia lawyer held fast to Newman's simple words: "The best prudence is to have no fear."

The entrance of the United States into the war imposed new obligations upon all loyal citizens. For two years Mr. Pepper served as Chairman of the Pennsylvania Council of National Defense. Even in his hard-worked life he had never shouldered duties which were, to use his own words, more "back-breaking." His great-great-grandfather, Thomas Wharton, had served in the same capacity—Chairman of the Pennsylvania Council of Safety—during the War of the Revolution. The average voter is apt to look adversely upon *any* candidate whose ancestors are a known quantity; but there is an aptness in this succession of offices—offices as strenuous as they were unremunerative—which should disarm the deep-rooted prejudices of democracy.

Mr. Pepper was appointed to the United States Senate by Governor Sproul in the winter of 1922, to fill the chair vacated by the death of the redoubtable old king-maker, Senator Boies Penrose. He is now a candidate for reelection. Should he win out, his triumph would mark an era in the political history of Pennsylvania. He is in no sense one of the "ordinary men" for whom we have been told officially—but I hope mistakenly—that "America was made." He is rather one of the extraordinary men who are perhaps made for America, who take to duties as a duck takes to water, who face responsibilities and carry burdens all their lives. He has been a force in his own city and State. It remains to be seen whether or not he is desired as a force in the country. Under any circumstances, life holds for him work in plenty, and honor, and esteem, and the old fighting faith that these things are well worth living for. The traditions of freedom warm his blood, and the stability of common sense steadies and animates his mind.

THE PETTY SOUL

BY FAITH BALDWIN

I
OH, if I go to heaven,
 I'll find it neat and small,
 With paved and pleasant footpaths,
 And nothing grand at all.

II
 The wide fields of the blessèd,
 They give on hill and sea,
 But unhorizoned beauty
 Is not for souls like me.

III
 My barren-breasted virtues
 Would be too ill at ease.
 A little heaven's harbor
 Is best for such as these.

IV
 And should hell be my portion,
 I shall not know that one
 Where gorgeous sinners shudder
 From sins which hide the sun.

V
 A little hell awaits me
 Of little sins and mean,
 A makeshift hell of hearsay,
 Hypocrisy, and spleen.

STRIKELESS FORT WORTH

IMPRESSIONS OF THE GATEWAY TO TEXAS AND ITS ENERGETIC PEOPLE—ITS SPECTACULAR SKY-LINE AND RAILWAY BUILDING—HOW IT MAINTAINED ITS CREDIT AT A CRITICAL HOUR—THE FRIENDSHIP BETWEEN ITS BOSSES AND EMPLOYED

BY SHERMAN ROGERS

INDUSTRIAL CORRESPONDENT OF THE OUTLOOK

THE motion-picture Texan and the real Texan are two different persons altogether. The Texas cities we see depicted in movie reels, where intoxicated, gun-toting cow-punchers wreck an entire town for mere sport, are altogether a different picture from the one that appears before the eyes of expectant visitors. The Fort Worth skyline reminded me of lower Broadway. Against the prairie it looms up something like Mount McKinley in Alaska.

The movie thrillers would have us believe that those who dwell on the southwest prairie, where cow-punchers to-day actually still exist, live in little shacks that can be pulled over by a celebrating rounder with a lariat and a cayuse. Possibly the directors of some of these films had indulged in too much "white mule" when they wrote the Texas scenes "true to nature." Texas cities resemble Los Angeles more than any other urban section of America. I believe I saw more attractive homes in Fort Worth than in any other section I have visited in this country outside of Los Angeles.

In a section of the country where there were supposed to be wild cow-punchers, grease grass, and cactus I found myself in a \$4,000,000 hotel. When taken to my room, I thought I was in the Pennsylvania or the Vanderbilt. I gazed out of my window at the new Waggoner Building and the Farmers' and Mechanics' National Bank Building, and rubbed my eyes. It was

about the same kind of a sight one would get looking south from the New York City Hall toward the Woolworth Building.

An hour later, while talking to the President of the Chamber of Commerce, I asked how they were able to build such a gigantic hotel in a city of a hundred-odd thousand, when there were other cities five times that population with nothing like it.

"Oh," he answered, casually, "a few progressive citizens decided that we needed a real hotel. They got together and raised \$1,200,000 to start the ball rolling in less than three hours."

At a business men's luncheon that day I saw a half-dozen propositions put through that involved fair-sized sums of money. It was raised in a few minutes without any prompting from the chairman. Here was the kind of spirit that builds cities. I could visualize, as I watched these subscriptions quickly raised, the spirit behind the men who built the Fort Worth skyline; whose ancestors had fallen at the Alamo, had beaten Santa Anna into submission, and gained their independence from Mexico; established a Republic; elected a President; and then gladly became a part of the United States.

The early history of the building of railways through Fort Worth bears witness to the class of men who resided in that section then, and whose descend-

ants still "carry on" the same policies. The first road built into Fort Worth was the Texas and Pacific. It was constructed to a little west of Dallas, when the panic of 1873 struck the country. Building ceased. Fort Worth began to disintegrate as a city. The railway company had secured the right of way, and if the panic had held off just thirty days the road would have been constructed through to Fort Worth. When the road failed to materialize, the population dropped to less than 1,000. These people remained because they had ultimate faith in the growth of the city.

When the land grant was given to the Texas and Pacific, however, it was conditioned on the road being constructed to Fort Worth by the first day of January, 1874. The panic blocked this construction, but the Legislature validated an extension, and each succeeding Legislature granted extensions until the Constitutional Convention of 1875.

The people had by this time despaired of getting their railway, and so they organized a company of their own, subscribed to the capital stock, and made payment in money, labor, material, forages, supplies, or anything they possessed of a marketable value. Major K. M. Van Zandt was president of this company. When the Legislature assembled, the railway company made another bid for an extension of time, since the prize was too rich to abandon without a struggle, and since they had spent large sums of money in surveying and plotting land. So they took the contract off the hands of the construction company and made a desperate bid to complete the road before the Legislature could complete its reports and adjourn. The efforts of John C. Brown, vice-president of the Texas and Pacific, who had remained on the ground steadily, won out in a close fight.

On July 19, 1875, the first train rolled into Fort Worth in charge of Conductor

W. R. Bell, who still "pulls a rope" on the Texas and Pacific. Pandemonium broke loose in Fort Worth; lacking cannon, anvils were used to make an appropriate noise.

The building of the next transcontinental road through Fort Worth was no less spectacular. The Santa Fé started construction a short time later from Galveston north to Temple. Walter Gresham, who was director and field man for the Santa Fé, mailed from Temple, on the same day and the same train, a letter to Fort Worth and Dallas stating that the town that would first subscribe a \$75,000 bonus and contribute depot grounds and right of way through the county should be on the main line of the Santa Fé. Peter Smith, one of the early builders of the South, got busy at once, and with the aid of a few of the enterprising "old timers" raised the cash bonus and secured the right of way before nightfall, and early the next morning appeared in person before the Santa Fé officials, and the road was thus secured by Fort Worth.

Seventeen railways enter Fort Worth, and in practically every case it has been a story of large bonuses and grants cheerfully and quickly given. To-day the railway yards of Fort Worth hold 14,000 freight cars, while 1,300,000 cars are interchanged there annually. The State raises between \$500,000,000 and \$600,000,000 worth of cotton every year, and Fort Worth industries alone produce \$450,000,000 worth of manufactured goods.

The Fort Worth preferential freight distribution area, with a population of 2,000,000, embraces 91,000,000 acres; its cotton production amounts to \$400,000,000 annually; corn, \$155,000,000; live stock, \$115,000,000. Even in oil (although I don't believe in oil; I have too many worthless \$50 "dry hole" certificates in my desk now), but they have real oil in Texas to the extent of about

\$245,000,000 a year. When I saw the great wells and great storage tanks, I wondered why some of the wildcat promoters who sold me stock four years ago could not have been fortunate enough to land in the Fort Worth territory.

Some idea of the vast expanse of the agricultural area of Texas can be gathered when comparing the large ranches in Texas with those of other States. The King Ranch, in Nueces and Kleberg Counties, is composed of about one million acres of land, and the owner of this small empire has about seventy-five thousand head of live stock. John G. Kennedy, another noted Texas ranchman, owns five hundred thousand acres of land and about thirty thousand head of live stock. Yet these two immense ranches scarcely amount to more than a pinpoint on the average Texas map.

This section can grow anything from grapefruit to winter apples; its climate ranges from the semi-tropical to snow-line; on the same day within the boundaries of Texas people are bathing and reclining under beach umbrellas, and others, in the foothills, are hunting game on snowshoes.

I was especially interested in this "gateway" to the Gulf from a standpoint of its labor relations. I had been in Fort Worth but a few hours when the president of the Trades Assembly (A. F. of L.) took me on a motor trip about the city. I soon discovered why Fort Worth was practically free from labor trouble. Here was a labor leader who believed that every man who drew a day's pay should do a full day's work in return. He believed that the relations between employer and employee should at all times be one of closest co-operation, and in case there were disputes that these disputes should be settled by arbitration instead of strikes.

When I was in Fort Worth in October, 1921, there had not been a strike of any

note for twenty years within the city—although thousands of men are employed—for here was a new type of labor leader. The spirit of unionism throughout the town was different from any place I had ever been in. In 1919 and 1920, while other cities were tied up with the high cost of building construction, with woeful inefficiency of labor and childish restrictions, Fort Worth constructed 2,400 homes, 2 twenty-story buildings, and a \$4,000,000 hotel, and during this peak period their labor retained a high standard of efficiency, in marked contrast to Northern cities. Here I found labor organizations that did not allow agitating organizers within their jurisdiction. One large power company has never dealt with a labor organization, because the men did not need one for their protection. An organizer dropped into Fort Worth one day to organize the employees of this company. The Fort Worth labor leaders said: "No. If these men want to get in, all right, but we're not going out and try to force them in."

The greatest asset Fort Worth has to-day is the spirit of the workingmen who comprise a large share of her 140,000 population.

Fort Worth has a great reserve of cheap power, and a project is now under way which will probably provide enough power to run the whole northern section of Texas for all time to come.

A number of big packing plants have located in Fort Worth because of its exceptional transportation facilities and reasonable labor attitude. The packing-houses now do a business of \$150,000,000 annually, and 3,000,000 head of cattle go through Fort Worth every year.

Many of the old Texans cannot understand why these large plants are locating in their city, rather than in other Texas cities. But if they had lived in

some of the Northern industrial centers from 1917 to 1921 they would easily understand. It is because of the favorable labor situation. Here is a city of 140,000 people whose chief industry is manufacturing, and it has had no notable strike in twenty years!

I drove through that section of the city where workmen resided, although there was no "workingman's section." They lived in bungalows that made my mouth water when I contrasted them with my congested New York. Here were men who owned their own homes, or who were paying for them; who had just as much at stake in the city as the manufacturer, the business man, or any one else who took just as much pride in civic betterment as any member of the Chamber of Commerce or Bankers' Club; men who could speak English, and who believe in America; men imbued with the same spirit of community building as the Chamber of Commerce or Merchants' Association. They had fine school buildings, spacious playgrounds, well-kept lawns. I did not see a tumble-down shack nor a decayed fence within the city limits.

Fort Worth was built on a prairie, and it wounded the pride of its citizens that they had no lake resorts. In 1913 some of the leading spirits of Fort Worth, under the leadership of William D. Davis, conceived the idea of creating a lake by damming the west fork of Trinity River at a point six miles northwest of the city. In a short time the project was under way. Construction was started in 1913, and completed in 1916. It cost several million dollars. When finished, a concrete conduit was built, carrying the water to Fort Worth. This lake holds forty billion gallons of water and has a shore line measuring forty miles. The lake proper is fourteen miles long and two

miles wide. The drive around this lake is one of the "show" drives of the United States.

Peter Smith, Major Van Zandt, Captain B. B. Paddock, Colonel Paul Waples, Joe Brown, are examples of the kind of men who built Fort Worth. It was Paul Waples who, in the 1907 panic, when Texas's creditors in the East and North were demanding that the debts due them be instantly discharged, issued a statement of the assets in cotton and material eligible to payment of debts, and asked the question: "Why do creditors of business houses and individuals in Texas clamor for the pound of flesh?" He demanded that a reasonable time be granted Texas to pay, and promised that she would not only discharge all her debts, but leave a surplus large enough to finance her for a generation of normal conditions. Time was given. Creditors became aware that Texas was one of the most resourceful States of the Union.

The younger element of Fort Worth Builders includes such energetic figures as L. H. McKee, W. M. Massie, William Monnig, Amon G. Carter, William D. Davis, and T. B. Yarbrough.

Colonel Louis J. Wortham is the Watertson of Texas. He started on his newspaper career in 1882, and is rough and ready if necessary, though naturally endowed with the deportment of a Chesterfield. He is the editor of the "Star Telegram."

These new Texans reflect much of the same indomitable spirit of the "Alamo" Texans. They have accomplished more than they really intended to. Fort Worth was built by men who realized that workmen ought to own attractive homes of their own, and the whole city co-operated toward that end. The result is thousands of good-looking bungalows and very little radicalism.

WOULD THEY DESTROY LABOR UNIONS?

BY ELLIS SEARLES

EDITOR OF THE "UNITED MINE WORKERS' JOURNAL"

BACK of the demand for the incorporation and taxation of labor unions, about which so much is heard these days, there is to be seen the hand of the union-busters of the country. That's what the members of organized labor say, anyway. If labor unions were compelled by law to incorporate, then the treasury of the union would be subject to raids by employers or others who might wish to stir up a situation that would afford opportunity for such raids. A labor union could not exist under such circumstances, for its funds would be attacked from every possible quarter.

If trade unions were incorporated, they would at once become constantly menaced by receivership suits, thus placing their property and treasuries subject to the whim of hostile courts,

and there are many courts in the land that are hostile to organized labor. Corporations of business men are not subject to this danger. The activities of a corporation are limited and clearly defined by charter. It is different with a trade union. Its activities and functions cannot be defined by any charter or any law. A labor union is a social institution, which cannot be separated from the human beings that compose it.

There are labor spies in every industry in the country. These spies are there for the purpose of keeping the employer informed as to all activities of the employees, and especially every symptom of unionism that may appear among the men. In some industries they are called spies, but in the coal-mining industry they are armed gunmen

and thugs who seem to bear a roving commission, not only to roam at will over the mountainsides of West Virginia and other places, but to assault, shoot, and murder those among the mine workers who dare even to think aloud about organizing a local union.

If labor unions were incorporated, these spies and hired thugs could easily institute fictitious lawsuits that would tie up the funds of the unions and render them helpless, or, where a hostile court could be found, they could obtain judgments that would ruin the unions.

In other words, incorporation would enable their enemies to throttle the life out of every labor union in the land. And the unions believe that such is the purpose of those who are calling so vociferously for incorporation. It would

be an easy matter for an employer to "plant" a hired spy in any labor union as a member, and this spy could stir up and incite acts of violence and damage that would afford sufficient grounds upon which to base suits for damages that would bankrupt the organizations and keep them bankrupted. That this could be done is best proved by the fact that it has been done many times.

Those who are backing the plan to compel labor unions to incorporate insist that labor unions should stand in the same position before the law as corporations. They lose sight of the fundamental difference between a business corporation and a labor union. A business corporation is a commercial institution. A labor union is not commercial. It has nothing to sell. It is a body that undertakes to afford protection to its membership in their dealings with their employers. It believes in and practices the idea of collective bargaining between employers and employees. Labor unions are composed of the same type and kind of human beings that are found outside their ranks. They are the same kind of American citizens as the stockholders of a corporation, and the same kind as those who are engaged in business or in the professions.

Promoters of the plan to force labor unions to incorporate say it is necessary in order that the unions "may be held responsible for their acts." But we should remember that corporations are not formed for the purpose of being "held responsible." Their prime purpose is to evade responsibility.

When two men form a partnership in business, one partner can contract debts for the partnership and all partners are responsible for the full amount of these debts. All of the property of the partnership can be seized to pay the debts contracted by any partner, and if this is not enough, then the private property of each partner is liable for the full amount of the debts.

But it is different with a corporation. Under this form of doing business there is no such danger to the individual. When an officer of a corporation contracts indebtedness in the name of his company, only the property of the corporation can be reached for settlement. Property of individual stockholders cannot be levied upon, as in the case of a partnership.

Corporation stockholders invest what they are willing to risk in a corporation, knowing that they cannot be held responsible for more.

It is also interesting to note that these same people who cry so loudly for incorporation and taxation of labor unions never say a word about compelling business associations to submit to a similar law. There are associations of coal operators in every coal-producing field in the United States, and none of them is incorporated. There are associations of manufacturers in every line, and they are not incorporated. We find National associations of manufacturers; whole-

salers in every line of trade; associations of millers, druggists, grocers, clothing merchants and manufacturers; associations of iron and steel manufacturers; associations of railway executives; associations of employing printers; associations of this, that, and the other character. And then there is that wonderfully mysterious something that is known as the National Steel Institute, or something of that kind, headed by Judge Gary, the champion heavyweight union-buster of the country. Members of the "Steel Institute" have long denied that it had anything to do with the fixing of steel prices, but all who believe that story will please stand on their heads.

None of these associations are incorporated. No matter how much damage they might do to the welfare of the nation, no matter how they might undertake to regulate and restrict business and prices, they could not be attacked as corporations. Neither are they required to pay taxes, because they are not legal entities.

But we do not hear any one demanding from the housetops that these commercial and business associations should be required to incorporate and pay taxes. Nor do we hear any demand that they be required to open their books and business for public inspection, as labor unions are asked to do.

If labor unions were incorporated, they would of course be forced to file reports of their business and affairs. Their books would be open to inspection at all times. They could be required to account for every penny of income and expenditure, and they would be limited and restricted in both directions. Every union-busting, open-shopper among the employers feels that this would be a means of helping to break up labor unions.

Members of unions ask why these employers are so anxious to have the unions do something that they themselves are not willing to do. It will be remembered that the Federal Trade Commission issued an order requiring coal-producing companies to file with the Commission detailed statements of their cost of production of coal, including the amount paid for wages and all other purposes. Coal operators refused to comply with this order, and when the Commission insisted upon compliance the operators went into a Federal court and obtained an injunction against the Commission to prevent it from inquiring into the cost of coal production. It does seem that when employers demand publicity for all of the receipts and expenditures of labor unions they should be willing also to make public the details of their business.

What is it that these coal operators seek to hide from the public through the use of the process of injunction? They are insisting that wages of coal miners are so high that they prevent coal companies from selling their coal in American markets. They place all of the blame for the present unsettled condi-

tions in the coal business on the miners' wages. They say profits have been wiped out and that they are not now and have not for a long time been making money. But they offer no proof of these statements. In fact, they use every means to prevent the public from ascertaining whether they tell the truth about it. They rush off to a court and plead for protection against the prying eyes of the public. The people must not be permitted to learn the facts. The public must take their word for everything and be satisfied.

If these coal companies were honest with the public, if they had nothing to hide, if they were not attempting to cover up the real facts in regard to their profits, they would willingly permit the Federal Trade Commission to have access to their books. The average citizen cannot take kindly to a set of men who demand publicity for the business of every one except themselves.

Now and then we hear some one say that the United Mine Workers should be subjected to strict Federal supervision and investigation because of the existence of the check-off system for the collection of the dues of its members. The charge is frequently made that this check-off system is illegal, and that money collected through its use is expended for unlawful purposes. The outrageous charge is sometimes made that the check-off is used for the collection of money to finance riots, murders, and other crimes in the coal-mining fields. The fact is that the check-off has been held to be legal by the United States Circuit Court of Appeals and it stands to-day as a long-established and fully recognized principle in the industry. The Borderland Coal Corporation, a non-union concern of West Virginia, sought to destroy the check-off with an injunction suit, but the Court of Appeals refused to enjoin it. The Court said the check-off was nothing more than a voluntary assignment of wages already earned by an employee, the same as if he assigned a part of his wages to pay a grocery bill or any other obligation. Certainly there is every legal recognition of the principle of voluntary assignment of wages. The wages are not assigned for the purpose of financing riots, disorders, murders, and the like. The assignment is made for a perfectly valid and recognized legal purpose.

There have been so many misstatements in regard to the "march" in West Virginia last summer that it may be well to give the facts in connection with that affair. It is frequently said that this was an outbreak of union coal miners, and it is sometimes referred to as "a treasonable insurrection of union miners." It was nothing of the sort. Such charges are made for the sole purpose of creating in the public mind a prejudice against the miners' union. The armed gunmen and thugs employed by non-union coal companies, who for years have made it their business to keep the union out of these fields, even

THE FARMER
of the metropolitan district has received

THE OTHER FOURTEEN AND ONE-HALF CENTS

Mr. Rogers's article is not so much a record of expenditures as a story of the dramatic and scientific fight for clean and wholesome milk which has saved thousands of lives and lowered to an amazing extent the infant death rate of the metropolis.

to the extent of shooting down innocent persons, became so bold and their outrages were so terrible that the people of that section of West Virginia refused longer to stand for such things. This "march" was a result of that wave of indignation. Miners, farmers, mer-

chants, carpenters, professional men, and citizens from many walks of life decided to put an end to the reign of terror, and they assembled for the avowed purpose. It was not a question of unionism and non-unionism. It was a matter of self-protection against the

murderous band of roving desperadoes. And had it not been for the interference that came from the outside those thousands of determined men would have cleared them out and made life and liberty safe in West Virginia. That's the truth about the "march."

RICH DAIRYMEN?

BY EDWARD K. PARKINSON

AFTER dairy farming for some years one has, naturally, a pretty clear idea of the profits to be made by selling milk to city people, and also when one has a good thing a certain shyness crops up on being asked by others to tell how easy it is to get rich by dairying.

The Christmas holidays are the one time during the year when my wife and I make a point of getting away from our farm to visit a cousin in Manhattan who is a bond broker. What wonderful days these are, with theaters, opera, concerts, moving pictures, shops, etc., filling our waking moments with one sensation after another, for it's our vacation, and we feel much like Browning's Pippa when she exclaims: "Oh, Day, if I squander a wavelet of thee!" Three days of riotous pleasure, worth a king's ransom! Only three out of 365 with no deductions for holidays and Sundays—just one, two, three days, all our own!

Much to my amusement, my cousin greatly enjoys calling me the Milk Baron. On Christmas Eve, which last year fell on Saturday, we were discussing conditions in general in front of the fire over our mild Havanas. Prices were dropping all along the line with the notable exception of food, and, "Hang it, Billy," exclaimed my cousin, "you farmers have us by the throat these

days! Not that I personally begrudge you a cent. Go to it, I say, make hay while the sun shines. But, really, old man, when we have to pay twenty cents a quart for good milk for the children I call it a hold-up game. Of course you chaps took your cue from the labor unions and formed the Dairymen's League, and, as far as I can see, have made a great success of it. For, whereas the wholesale milk dealers in New York used to dictate prices to the dairymen, now we pay what you are pleased to ask. Great game! I'm proud to be connected with a milk baron."

"My dear Jack," I replied, warmly, "your ignorance outside of your personal affairs is colossal. Do you know what I am paid for my milk this month? No, of course not! You just jump at conclusions. Well, the League price is close to five and a half cents a quart for the same milk for which you paid twenty cents, and the spread between those two figures covers freight, pasteurization, and distribution. I have absolutely no say as to what I shall receive for my milk from month to month, the price being fixed by the Price Committee, which is made up of the Producers' Organization and the Distributors' Organization. In setting these prices the main factors considered are supply and demand and the price of cattle feed. It so happens that I have my note-book in

my pocket, and, seeing you are my cousin, I will let you into the secret of my rapid rise to affluence.

"Our farm," I continued, "consists of two hundred acres, of which sixty acres is in pasture, through which, fortunately, a stream flows. I raise corn for silage and for feeding, oats for feeding, hay and clover, enough potatoes and vegetables for ourselves, besides plenty of fruit for home consumption. Now let's take the cows, who are the money-makers. We have twenty-five in milk all the time, and in order to keep up this number it is necessary to replace, on an average, seven cows each year. These are raised from our own calves and must be fed and cared for until they are two years old, when they drop their first calves. Even then they do not reach their best as milk producers until their second and sometimes their third calf is born.

"These cows are all splendid Holsteins and give about 10,000 pounds of milk a year each, or about 13.5 quarts per day. This month I will receive \$2.52 per 100 pounds of milk, or, as I said before, 5.5 cents per quart. So, putting the very best possible face on it, my gross profit, if I could count on 5.5 cents per quart right along, would be \$6,675 a year. Easy, isn't it? Nice, comfortable home, plenty of fresh fruit and vegetables, two men to help with the

(C) Ewing Galloway

"GIVE ME THE COUNTRY, WHERE THERE ARE DUMB BEASTS TO CARE FOR AND MAKE MUCH OF"

work with cottages to live in, etc. Can't you just picture me going down to the bank each month in my car and depositing my wad?

"But just hold on a minute. I mustn't forget to charge off one or two little items against my cows: Bedding per cow; keep of bull per cow; labor per year per cow; interest on money invested in barn and cow; taxes on cow and barn; insurance on barn; depreciation on each cow, and heat, light, medicines, disinfectants, veterinary service, and ice, amounting in all to \$65 on each animal. Besides this there is the feed to add—hay, silage, bran, corn-meal, gluten-meal, cottonseed-meal, and pasturage—totaling a few cents over \$167.

"Of course you will say, 'Oh, but you have your own hay, corn, silage, and pasture.' Quite true; but don't forget that my corn would sell on the market just as quickly as the other fellows', so I must charge it up at market prices.

The same is true of hay. My silage I only charge for at its food value plus labor and fertilizer. My pasturage charge is only normal, for had I no pasture I should have to provide more silage and hay. So, you see, I must take \$65 plus \$167, a total of \$232, from the gross profit of \$252 on each cow, leaving \$20, to which may be added the value of her calf at birth, \$15. I then have a net profit on each cow of \$35, or \$875 from my entire herd. Wouldn't you like to buy me out, old chap? Before you make an offer, however, let me add that in order to get this splendid income I must get up at half-past four every day, winter and summer, and when any of my cows drop their calves I am always with them, whether it's the middle of the day or night. I wash and clean the milking machines myself, for, although I have good men, I wouldn't feel safe in trusting this work to either of them.

"In the winter there's the wood to cut

and ice to get in, besides the repairs on farm implements and buildings. So you must acknowledge that, in a measure at least, I earn my princely income. You are wondering how I manage to get along on \$875 a year. Well, I couldn't if Bessie hadn't turned to, like a trump, and helped by raising poultry, for she takes entire charge of a flock of 500, and so adds about \$550 more to what the cows bring in," I ended, lighting a fresh cigar.

"Billy, you amaze me," said my cousin, "and if I didn't know you intimately and hadn't spent days on your farm I'm afraid I should be a doubting Thomas. It had never occurred to me that farming was like any other business, or that a practical farmer had to apply business principles to his work, just as I do. Somehow, I imagined he raised all his own feed and fed it out to his cows, and then counted the money received from them, as profit. What, in the name of goodness, does a man see in working hard all his life for a paltry few hundred dollars a year? Why, I often make in a month what takes you with the hardest sort of labor to pull in in a year!"

"Well, Jack," I replied, "you have overlooked the greatest factor in life—individuality. From my point of view, to see you grubbing every day in an artificially lighted den downtown, with money-getting occupying most of your waking hours, is a pitiful sight. To me, you have missed the very essence of life. You never see the sun rise in all its wonderful beauty, or marvel at the re-awakening of life with the first flush of spring, nor would you feel any pleasure in caring for dumb animals that look to you through gentle, trusting eyes for their sustenance. The birth of a little helpless calf would to your mind only mean extra work, not the completion of one of nature's most stupendous achievements—a new life.

"Then you live in a constant uproar—cars tooting, bells clanging, and doors slamming from morning until night. You are only a unit among millions of other units. Were you to be stricken in the street, a policeman would turn in a call for an ambulance and off you would go to some hospital, where you would consider yourself lucky if your wife ever received word as to your whereabouts.

"Not for me, Jack! Give me the country, where I can watch things grow, where there is plenty of elbow-room, where I'm independent and have to stand on my own feet without help, and where there are dumb beasts to care for and make much of. After all is said, money can't buy contentment, and don't forget this, although you may not believe it, it takes as much brains to make a success in farming as in any other business. Well, old man, each to his own taste, after all, and if we are going to the theater, it's about time we started, isn't it?"

MOLIÈRE BREAKFASTING WITH LOUIS XIV AT VERSAILLES

THE MODERNITY OF MOLIÈRE

BY BRANDER MATTHEWS

MONSIEUR MAURICE DONNAY and Monsieur André Chevrillon have come three thousand miles to take part in our tribute to the genius of a man who was born three hundred years ago. Our invitation and their crossing of the Atlantic bear witness to the fact that the fame of Molière is both enduring and world-wide. No one of the makers of French literature is more typically, more fundamentally French than he, and yet here in a city almost unknown and absolutely unimportant three centuries ago men assemble to do him honor and to acclaim him as the master of modern comedy.

He was not only a man of his own country, he was a man of his own time. In the early years of the long reign of Louis XIV he came a little later than Corneille and a little earlier than Racine; and neither of them is as representative of that glittering epoch as Molière; and yet half a dozen or half a score of his thirty plays are alive to-day in all the freshness of their eternal youth. He is not for his own country alone, but for all civilization; and he was not for his own age only, but for ours also. To say this is to say that he possesses the two indispensable qualities of a classic: his masterpieces have a large measure of permanence and a large measure of universality.

I have studied him lovingly for half a

(C) Keystone

TABLET ON THE HOUSE IN WHICH MOLIÈRE WAS BORN, IN THE RUE ST. HONORÉ, PARIS, WITH DECORATIONS PLACED THERE AS A PART OF THE CELEBRATION OF THE TRICENTENARY OF THE PLAYWRIGHT'S BIRTH

century, and as I came to a more intimate acquaintance with his writings and to a keener appreciation of the man himself I felt more and more the modernness of his work. No doubt, it bears unmistakably the impress of his own time—all masterpieces do that of course, those of Sophocles and Shakespeare no less than those of Molière. Yet he is more modern than the great Greek tragedian, who lived two thousand years ago; and more modern even than the great Englishman, who wrote both comedies and tragedies, and who died only six years before the great Frenchman was born. The great Spanish playwright Calderon survived Molière eight years; and his pieces seem to us now almost archaic in their stagecraft and in their spirit, whereas the comedies of Molière are modern both in their form and in their content.

The modernity of his form is obvious enough, and he is master of modern comedy, not only because he realized better than any predecessor in any country what the true province of comedy was and what were its possibilities and its limitations, but also because he wrote for the modern playhouse, with its roof, with its artificial lighting, with its scenery, with its seated spectators. The pattern he devised for this modern playhouse is the pattern employed to-day by the playwrights of every Euro-

From an old print

pean language, even though they may be totally unaware of the debt they owe to him. Shakespeare's plays have to be modified to adjust themselves to our theaters; Molière's do not demand any rearrangement, not a single transposition or a single omission. Sheridan could not have plotted the "School for Scandal" if Molière had not plotted the "Misanthrope" and the "Femmes Savantes." Ibsen could not have put together the "League of Youth" and the "Pillars of Society" if Molière had not devised "Tartuffe."

He had profited by his early study of Plautus and Terence, as they had profited by their study of Menander; but the Greek and the two Latins in their turn had progressed only to the play of intrigue, the comedy of anecdote; they were not equipped to achieve the comedy of manners, the comedy of character, the social drama, the play which, while it makes us laugh, also makes us think. Their field was narrowly restricted, and the hampering conditions

of the social organization in Athens and in Rome did not tempt them—indeed, did not permit them—to achieve a large and liberal treatment of human nature. Shakespeare, as it happened, never undertook the comedy of manners which is also a comedy of character, perhaps because his social background and country did not supply the material for this special type of comedy. The London of the Virgin Queen lacked the urbanity of the Paris of the Grand Monarch. Elizabethan society was boisterous in speech and violent in temper; and therefore no one of Shakespeare's ever-delightful comedies, sometimes delicately romantic or sometimes robustly farcical, is a picture of the life of his own time and of his own country. Molière in four or five or six of his amplest and deepest comedies brings before us his own contemporaries as he had observed them in the city of his birth.

It was these contemporaries that Molière had to please if he was to keep his theater open; and this is what every

great dramatist has had to do, Sophocles no less than Shakespeare. We can see that Molière took account of what was wanted by the Parisians of the second half of the seventeenth century, by the young King, by the burghers, and by the populace also. He gave them what they expected from him, and also more than they expected, sometimes even more than they were ready to receive. Leading his audiences upward, coaxing them along, skillfully stimulating their desires, he was able at last to rise to a level to which no earlier comic dramatist had aspired.

It is not widely recognized that great dramatists have almost always been popular in their own day. True it is that they may not have been adequately appreciated while they were alive, but they were successful, none the less. I doubt whether even Ben Jonson, with all his friendship for Shakespeare, was really aware of his friend's true greatness; and I fear that of all Molière's associates only Boileau and La Fontaine were keen-eyed enough to measure his superiority. But there is no denying that Shakespeare and Molière were popular favorites and that the playgoers flocked gladly to see their plays performed.

This immediate popularity of theirs was due in a measure to their skill in hitting the taste and in satisfying the likings of their contemporaries, although of course their permanent fame could be assured only by their major merits, by their power of creating characters which transcend the demands of the moment, which are deeper than the fancies of the day, which are eternally attractive because they are eternally veracious.

Molière did not hesitate to amuse his audiences with satire of passing fads and follies, with things strictly contemporary, with things absolutely up to date. Now, it is the disadvantage of the contemporary that it is four parts temporary; as it is disadvantage of the up to date that it is swiftly out of date. It is a striking testimony to Molière's genius that his satire of the whims and oddities of his own period has its lesson for us in another century and in another country. What was fleeting and momentary is on the surface only, and beneath it we can discover a veracity as abiding as human folly is perennial. The fashion has altered and not a little, but the stuff is the same, since it is woven from the unfailing absurdity of human nature.

The affectations that Molière held up to scorn in the "Précieuses Ridicules" in France are not unlike those which we laugh at to-day in America—in the "Culture Club of Keokuk, Indiana," for example, and in other clubs not so far from Manhattan Island. The Learned Ladies, the Femmes Savantes, of Manhattan Island are not now devoting their time to Greek roots, they are digging up the roots of society; they are

No highway engineer or road official should be without a copy of our latest manual, "Road Maintenance with Tarvia". Our nearest office will gladly send free copy on request.

The Future of a Community often lies in the Road Commissioner's hands

Although the Road Commissioner never "heads the ticket" on Election Day, there are few public officials charged with duties more vital to the public welfare.

Good roads are indispensable to the progress and happiness of every community. With good roads, getting to town is made a matter of minutes—not miles; business flourishes, hauling costs decrease, property values rise, children enjoy the benefits of a central graded school, community and social life is broadened and made more enjoyable. The future holds forth great promise.

Throughout the country our engineers have demonstrated to thousands of public-spirited road officials the great saving re-

sulting from a definite policy of Tarvia construction and maintenance.

This popular road material is unequalled for building new roads, for resurfacing worn-out macadam, for repairing and maintaining improved roads of every type. Special grades are made for specific uses.

Tarvia roads are an indispensable part of every Good Roads Program. They are comparatively low in first cost, and are so much more economical over a term of years that the saving makes a more extensive road program possible.

If you want smooth, dustless, mudless roads in your community 365 days in the year, write to our nearest office for free copy of our illustrated "General Tarvia Catalog." You'll find it interesting.

Special Service Department

In order to bring the facts before taxpayers as well as road authorities, The Barrett Company has organized a Special Service Department which keeps up to the minute on all road problems. If you will write to the nearest office regarding road conditions or problems in your vicinity, the matter will have the prompt attention of experienced engineers. This service is free for the asking. If you want better roads and lower taxes, this Department can greatly assist you.

Your Wife and Your Estate

... "My wife is a woman of more than ordinary intelligence, but she knows practically nothing of business and doesn't know a stock from a bond. I have been too busy to reach her. And I have been too engrossed in my business affairs to think of making a will. . . . Would you advise me to name a trust company executor and trustee of my estate? Would such an arrangement effectually prevent the beneficiary of my estate from squandering her inheritance, especially in worthless promotion stocks?"

THE above letter to the Financial Editor of the New York American was answered in part as follows:

"By all means have your lawyer draw a will for you and do it without delay. Then arrange with the trust company to act as executor and trustee of your estate.

"Your wife, in the event she survives you, will then be protected from vendors of spurious stocks and bonds. She will have no responsibility of reinvesting funds, and thus there will be no danger that your money will go into speculative securities. She will have at her call always reliable counsellors in all her business problems.

"The trust companies are infinitely better equipped through experience and facilities to take care of estates than any individual. . . ."

Most men—probably you yourself—face a similar problem. Discuss it with a trust company officer today. Ask him for the booklet on wills and trusts entitled "Safeguarding Your Family's Future," or write to the address below for a copy.

parlor Socialists; they are Little Groups of Serious Thinkers, who pride themselves on being open-minded, not having discovered the inconvenience of having minds open at both ends. The Imaginary Invalid to-day is a morbid student of psychoanalysis making a Freudulent collection of his own complexes. And Tartuffe? Well, our Tartuffes do not masquerade as religious bigots; rather are they moral reformers, damning the sins they have no mind to, reformers for revenue only, as dangerous to the public welfare to-day as was Tartuffe in his time. What is Scapin but a "proof before letters" of the chief figure in our crook plays? What is the unscrupulous valet who befools Monsieur de Pourceaugnac but the first edition of our confidence operator, our bunco-steerer—if I may venture to employ these unsavory neologisms? My sole excuse for this lapse from linguistic propriety is that I want to emphasize the fact that Molière is our contemporary, after all—that he is quite up to date two centuries and a half after his death.

Molière is important to us here in America, not only because of the pleasure and the profit we can find in the performance of his plays and in their perusal if we are denied the benefit of seeing them acted, he is important to us not only because he is the master of modern comedy, but also because he is the chief figure in French literature, because he united in himself certain of the chief characteristics of that literature, its dramatic ingenuity and its abhorrence of affectation, its relish for the concrete and its social instinct. It is good for us to see these characteristics in action; and the lesson Molière has for us transcends the limitations of literature. While there may be a more soaring imagination, a more easily released energy, in English literature in both its branches, British and American, than there is in French literature, there is a far less persistent application of the reasoning powers, a less free play of the intelligence, less sobriety and less sanity, more extravagance and more exuberance. The French inherited from the classics a sense of form, a desire for unity of tone, for harmony of color, for logic in structure, and for lucidity in style. If Carlyle and Ruskin and Whitman had sat at the feet of the masters of French literature, they would have been less impatient of authority, less flagrantly individualistic, less rhetorically riotous. Though they might have lost a little, they would have gained much. Nisard knew his countrymen when he asserted that in France "reason, which is the common bond of all men, is more highly esteemed than imagination, which disperses them and isolates them."

Here in America we are not likely ever to forget the indebtedness we are under to France for coming to our rescue in our hour of need nearly a century and a half ago; that debt is a debt of honor, and it is not outlawed by time. Nor can we fail to remember that it

Getting Big Business out on time—contented

The new Light-Running, Quiet-Running Royal speeds up the stenographer's work by lightening it. Its super-elastic touch is a marvel of lightness to her, and its clean, accurate typing the source of much satisfaction. It doesn't have to be "driven." Rather, the keys seem to fly and carry the fingers along with them. Contentment!

This Quiet Royal materially reduces the noise and clatter of typing. Disturbance and distraction are real dollars and cents liabilities in an office. Everything that is conducive to clear thinking and concentration is a real dollars and cents asset, and the Quiet Royal is exactly this.

The Light-Running, Quiet-Running Royal is already getting the stenographic forces of Big Business, and businesses that are going to be big, out on time—contented. It is the answer of a great inventor to a need long felt by aggressive, executives and office managers.

Our fifty-six page book, "The Evolution of the Typewriter", beautifully illustrated in color, will be mailed free on request. Address Department O.

was a Frenchman, Rousseau, who inspired the superb eloquence of the Declaration of Independence, and that it was another Frenchman, Montesquieu, whose political sagacity guided the makers of our Constitution. The tie that binds us to France is twisted of many strands of many colors, but we have reason to believe that it is strong enough to withstand any strain that may be put upon it.

THE NEW BOOKS

FICTION

ORDEAL OF HONOR (AN). By Anthony Pryde. Robert M. McBride & Co., New York. \$2.

Not equal to Mr. Pryde's best work, but still a fairly readable plot story.

TIDE RIPS. By James B. Connolly. Charles Scribner's Sons, New York. \$1.75.

"What Price for Fish?" ought to have a special prize as the best tale of Gloucester fishermen since Kipling wrote "Captains Courageous." Others of these sea tales are almost as good. Mr. Connolly leads among living American writers about seas, ships, and sailors.

YOLLOP. By George Barr McCutcheon. Dodd, Mead & Co., New York. \$1.

A more amusing bit of burlesque writing has not appeared for a long time. If we are to take it as a protest against humane prison methods, it has no force, because the author does not know the facts. We prefer to take it as a piece of fun pure and simple, and as such it is irrepressible and constantly mirth-provoking.

POETRY

DIVINE COMEDY OF DANTE ALIGHIERI (THE). A Line-for-line Translation. By Melville Best Anderson. The World Book Company, Yonkers-on-Hudson, N. Y. \$20.

This sumptuous volume is printed on hand-made paper and bound in Italian boards with vellum back. The translation is in the *terza rima*, the meter of the original. Marginal notes accompany the translation.

WAR BOOKS

THROUGH THE RUSSIAN REVOLUTION. By Albert Rhys Williams. Illustrated. Bont & Liveright, New York. \$2.

The cover-jacket of this book is from a Soviet poster. It shows the Czar, Kornilov, Kolchak, Denikin—all those who tried to prevent or crush the Revolution—impaled on the long lance of a Red Army horseman. The jacket appropriately covers a lurid book, for the lurid story is illustrated by lurid poster reproductions in color as well as by many photographs. The author went "through the Russian Revolution" as correspondent and participant. We see the vivid drama through his wide-open eyes, though we are totally unable to agree with his pro-Soviet prejudices. It is nevertheless interesting and instructive to note his summary of the results of the Revolution; among them are the following:

"It has destroyed the apparatus of Czarism. [The author omits to state

that it has but replaced one Czarism by another and more terrible kind.]

"It has transferred the great estates of the crown, the landlords, and the monastic orders into the hands of the people.

"It has nationalized the basic industries and begun the electrification of Russia.

"It has fenced off Russia from the unlimited exploitation of freebooting capitalists.

"It has brought into the Soviets a million workers and peasants and given them direct experience in government.

"It has organized eight million workers into trade unions.

"It has taught forty million peasants to read and write."

WITH THE RUSSIAN ARMY. By Major-General Sir Alfred Knox. Illustrated. In two vols. E. P. Dutton & Co., New York. \$15.

These volumes are valuable to those who wish to read in detail of the recent war on the Russian front. Certainly the author enjoyed large opportunity for observation. Previous to the war he was military attaché at Petrograd, and was at the front for three and a half years. Especial interest attaches to his description of the fighting in 1916, the text containing many hitherto unpublished details of Brusilov's offensive. The author also describes the political unrest preceding the Revolution, and gives an eye-witness's account of the Revolution itself.

HISTORY AND POLITICAL ECONOMY CIVILIZATION IN THE UNITED STATES. An Inquiry by Thirty Americans. Harcourt, Brace & Co., New York. \$5.

Tested by quantitative analysis, this is a great book. It is two inches thick; it contains five hundred and seventy-seven pages; and it is written, not by one, but by thirty authors.

Qualitative analysis leaves a trifling residuum. These thirty writers, mostly of what Don Marquis happily calls the younger group of serious thinkers, are no doubt sincere and earnest in their opinion—that American Art, Music, Literature, Law, Education, Economics, etc., etc., etc., are hopelessly vulgar and that civilization in this country is "grotesque, starved, and spiritually poverty-stricken;" but is American civilization greatly in need of new opinions just now? Henry Ford is chock-full of opinions, so is Edison, so is Senator Borah, so is William Jennings Bryan. Our own notion is that what American civilization needs most to-day is, not opinions, but coal and coats, potatoes and housing.

We venture to add this economic thought to the symposium of these thirty young American thinkers. Let them stop—at least temporarily—thinking up opinions to write about, and turn their attention to producing food and clothing. It will do them good to work with their hands, and will give their anxious minds a rest. Moreover, they may produce something that the public will buy. It is not likely to buy their

Books of the Finer Life

THERE comes to each of us now and again the desire to be reassured of the eternal fitness of life. We would taste of its greater contentments, vision its larger realities, experience its wider sympathies.

From some few books we can derive lasting encouragement. We can turn to them, again and again, as to tried friends, for understanding of our needs.

These books from the Abingdon Press bring sincere and well-expressed truths of life beyond the outer fringe of our own experience.

A HANDFUL OF STARS *By F. W. Boreham*

The author appropriates the title of this book from Caliban, who cries out, "O God, if you wish for our love, fling us a handful of stars." And these "stars" are gathered together to make a companion to his volume entitled "A Bunch of Everlastings."

Price, net, \$1.75, postpaid.

THE OPEN FIRE *By William Valentine Kelley*

This group of charming and gripping essays constitutes one of the rich and scholarly contributions of William Valentine Kelley to some of the vital discussions of this generation.

Price, net, \$2.00, postpaid.

RELIGION AS EXPERIENCE *By John Wright Buckham*

The chapters that make up this group of addresses and articles have their rootage in one central theme,—that of religion as a personal experience. They are an expansion and explanation of the declaration of the author that "the deeper thought of our time is turning away from religion as a dogma, as sentiment, as theory, as ethics, to religion as experience."

Price, net, \$1.00, postpaid.

WITH EARTH AND SKY *By Bishop William A. Quayle*

These essays are full of the mystery of the recurring seasons, and of the ineffable glory of flower and field, of mountain, meadow, river and prairie, of star and sun and cloud.

Price, net, \$1.25, postpaid.

FUNDAMENTALS OF FAITH IN THE LIGHT OF MODERN THOUGHT *By Horace Blake Williams*

As for the main message of these pages,—how much it is needed today! The world is noisy; we need to hear the Still Small Voice. The eternal in time is precisely the sense that the heart of the fussy world needs; and, like a refrain that is at once major and minor, that note sounds in this volume.—Bishop Edwin Holt Hughes.

Price, net, \$1.25, postpaid.

BEYOND SHANGHAI *By Harold Speakman*

This exceedingly charming "look in" upon China is unique because it is "different." The account of Mr. Speakman's unique experiences in that country is embellished by eight illustrations in color from paintings made on the spot by the author.

Price, net, \$2.50, postpaid.

THE ABINGDON PRESS
NEW YORK CINCINNATI

LETTING GEORGE DO IT

THUS I read in The Outlook: "One energetic worker will stimulate a whole gang to a greater effort." And I then indulged in retrospection, looking backward to events which are still fresh in my memory. It has not been long since I was among that blessed fraternity of workers whose praise is dwelt upon so often by writers and ministers. As they tell me, I did not appreciate my noble position, and when slack times threw me out of employment I really did wish I had my job back. Still, from my lowly and humble sphere of life, I feel that I am justified in doubting that quotation. I do not mean to call it insincere or reckless, but I wondered that workers in the writer's day of hard labor were so radically different from those whom I have worked with.

I worked several years in the open-hearth department of a steel mill, and I had a wonderful opportunity to observe the habits of my fellow-workers. I did observe them, and I felt when the mill ceased operations that I was very well acquainted with their eccentricities and customs.

I worked in the pouring pits, where the hot steel is poured into molds. There were six of us on that gang—as fine a gang of fellows as I would ever want to meet. There was seldom any friction between us; we all understood what we were to do, and if one of us found himself behind with his work, he always could depend on the ready aid of the other five to help him out. Perhaps the danger brought us closer together, for molten steel is a touchy and vindictive thing to work with and we were always running chances of being severely burned if not permanently disabled or killed. All of us could show scars where flying chunks of steel had burned us.

What I wish to make clear is that we were a typical gang of workers and that we held a certain regard and respect for one another which was never expressed in mere words. It was there and we knew it, and that was all that was necessary.

Among us was a worker who was a little more energetic than the rest of us. He often would finish his prescribed amount of work and hustle around and help some laggard out. Never was he at rest. If he could find nothing more to do, he would not, like the rest of us, find a hiding-place and loaf until the next heat tapped, but would go to his locker and wash and mend his clothes. We wore out many clothes, for they were continually catching afire, and, while the rest of us threw our ragged clothes away, he mended and patched his until they were nothing else but patches. We never ridiculed him or laughed at him for it; we envied him and wished we ourselves had the ambition to do likewise.

So I believe we were a typical gang—none of us real loafers, but all of us intensely human. This most energetic one must have seen that he was spoiling the rest of us, but still he continued

TOWNSEND'S MULTIPLEX

The Greatest Grass Cutter on Earth.
Cuts 100 Acres a Day.

Cuts a Swath 12 Feet, 114 Inches
or 86 Inches Wide

Floats over the Uneven Ground as a ship rides the Waves

One unit may be climbing a knoll, another skimming the level and another paring a hollow. Not an assembly of tractor and mowers but a single, compact machine like an automobile with 3, 4 or 5 cutting units. Driven by a 17 H.P. four cylinder, water-cooled, gasoline motor of great power and quality with Spittorf Dixie Aero Magneto, a wonderful radiator, sliding gear transmission, two speeds forward and reverse, etc.

Can also be driven by horse, the motor being removed or converted into a powerful tractor by detaching the cutting units.

Can back up or turn a complete circle in double its width. Can stop in six inches—it has a powerful brake—the only one that has. This is vital.

It has not a single cog wheel in its cutting units, but few elsewhere and those few very strong. The cutting units are controlled from the driver's seat. Throw them in gear, throw them out, raise them, lower them—all with a tiny lever at your right.

Do we guarantee it? Write your own. Send for catalogue illustrating all types of Townsend Mowers.

S. P. TOWNSEND & CO., 262 GLENWOOD AVE., BLOOMFIELD, N. J.

shouldering more than his share of the work. We all worked together at cleaning scrap—steel that has spilled and frozen—from the tracks. Our energetic one would always buckle into it, and how he would work! Sledge, bar, and fork, he wielded them all arduously. The rest of us languidly worked along, and unconsciously lessened our efforts, for we knew that the energetic one would do it all if we only permitted him to, for, as I said, we were merely human and not natural-born loafers. If some one had accused us of shoving the work on the energetic one, we would have been indignant and would have quickly denied it, but still it was so. His vigorous efforts far from stimulated us to follow his example; rather, we eased up and contentedly watched the work progressing without our aid.

But this habit was not confined to our gang. It was a characteristic of every gang. In the open hearth. The electricians, the millwrights, the ladlemen, the pitmen, and the riggers all exhibited the same characteristic. Each gang had its energetic worker too. I have never yet seen a gang of workers that did not boast an energetic member, and never yet have I seen that energetic worker "stimulate the whole gang to a greater effort." It was always the same: if he chose to exert himself, he might do so, but the rest never emulated him; if he was too energetic, he would make drones of the rest of the gang, and all unconsciously.

I noticed one day a dozen electricians on top of a ladle crane. They were changing an armature, and but two were working. The rest were smoking, talking, laughing, and keenly enjoying themselves. So were the two who were working enjoying themselves.

It is just a case of what a man enjoys doing. This man enjoys working hard and he is the energetic one, and he cares little if the work is shoved on his shoulders. It rather pleases him. Now this man takes little pleasure in hard work and it don't make a bit of difference how strenuously the energetic one applies himself to his work, the man who doesn't like to work hard is not going to do so if he can get out of it, and what better way has he in getting out of it than permitting the energetic one to do it all?

I do not mean to be so presumptuous as to criticise Mr. Lewis Edwin Theiss, or, apart from that one statement, I enjoyed his article, "What Life in the Country Has Taught Me About Religion," very much.

What I would like to know is: Have workers changed so greatly, or were they just different where I worked?

JOHN COLE.

West Middlesex, Pennsylvania.

DO you know that *The Outlook* pays for cartoons and photographs? Watch our advertising columns for the conditions of our offer.

At last the struggle which man has undergone since first he walked upright out of the jungle is at an end—thinking man has emerged triumphant—today for the first time it is possible to say with certainty man can be master of his own destiny because now he can control ALL his mental faculties. PSYCHO-ANALYSIS has achieved for humanity this new freedom by emancipating the conscious mind from slavery to the unconscious. Most of us have fought life's battles with one-tenth our mental heritage. Psycho-Analysis gives to us the other nine-tenths. In terms of success, happiness and accomplishment this represents a forward stride of which we can scarcely conceive.

Milestones of Progress

the power which Psycho-Analysis gives is measured in the milestones of progress.

Psycho-Analysis brings new freedom, new knowledge and conscious power alike to business man and day laborer, to banker and shop girl, to student and writer, to musician and scientist. To each of these and all of them the impossible becomes possible, the dream becomes the reality, the distance from the bottom to the top of the ladder of success is greatly shortened. And the unfolding and conscious grasp of

Not Theory But Tested Truth

To hundreds a message such as you are now reading from the American Institute of Psycho-Analysis has given new hope—stirred ambition and been the means within a few short months of turning failure into success—of doubling and tripling earning powers—of attaining advancement and recognition—of making men and women really know themselves and their powers. All this has been accomplished because Psycho-Analysis is not theory or mysticism but tested truth regarding the laws of life and the powers within each one of us.

Mail Lecture Course Offers Complete Mastery of Psycho-Analysis

A complete home study course on Psycho-Analysis is now offered. It has been prepared by leading national psychoanalysts, complete in every detail and so carefully graduated and explained that it can be quickly and easily grasped by anyone—not a book or even a set of books but a definite revelation of Psycho-Analysis as applied to YOU. As offered by the Institute, this course includes:

- ..30 Carefully Graduated Lectures
- ..17 Separate Volumes
- ..Member of our teaching staff a practicing Psycho-Analyst assigned to personally direct each one taking the course.
- ..Guidance upon personal problems afforded all who desire it.
- ..Discussion Papers and Instructor correspondence an integral part of the course.
- ..Certificate given on Completion of work.

Free Booklet "The Opening of a New World"

We have prepared for free distribution to those who would know more of Psycho-Analysis a booklet, "The Opening of a New World." It explains a plan whereby a limited number can get this only complete, comprehensive course on Psycho-Analysis at a greatly reduced price. Send coupon or letter TODAY for this great free booklet and start to claim your birthright. "The Opening of a New World" explains your easy home study course for complete mastery of Psycho-Analysis.

Whose Birthday
comes this month?

You

Can't Forget

UNLESS you want to. Your calendar is a constant reminder of the days on which your friends expect to hear from you with a message of love and good wishes.

Say it with Flowers

this month for the birthday greetings, the wedding anniversaries and other anniversaries of those dear to you, and endear yourself to them.

Remember that in a few hours' time flowers may be delivered by telegraph to any address in the United States and Canada by the Florists' Telegraphic Delivery Service.

BY THE WAY

"BALLADS are beloved wherever they can be kept alive," says the editor of "Notes from the Pine Mountain Settlement School" of Harlan County, Kentucky. "They disappear in crowds and floating populations. Their habitat is the countryside where people are not bewildered by new tunes. Here at the School we do not let in popular airs, in order that the children may not forget their own songs. A new boy may bring us in a different version of a familiar ballad, as when some one sang the well-known 'Madam, will you walk and talk with me,' with this addition, learned at home:

"I will give you a little pacin' horse,
That paced these hills from cross to cross."

"The subjects of our ballads," continues the editor of "Notes," "hold the mirror up to nature. Love, jealousy, murder, faithfulness—we sing of all these themes. Sometimes they are faithful pictures, too, of aspects of life found only in the Cumberlands. Let some one start the lively strains of the Ground Hog Song:

"Whet up your knife and whistle up
your dog,
We're off to the hills to hunt a
ground-hog,
Whack fal doodle all the day!

and we Kentucky mountain folk remember our own struggles 'over the hills and through the bresh,' where once we 'struck that hog-sign fresh.'"

Another song has a Mother Goose flavor, but may antedate that children's favorite:

When I was a little boy I lived by
myself,
And all the bread and cheese I had I
laid upon the shelf,
Wing wong waddle to my Jack straw
straddle,
To my John fare faddle
To my long ways home.

As an example of mixed metaphor, "S. R. O." contributes the following from the "Daily Enterprise" of Burlington, New Jersey:

Despite the attitude of the taxpayers, however, despite the thin ice on which they were skating at the time, the members of the board have come forward with still another shovelful to throw on the load and it is not surprising that the embers of protest have again been fanned into flame.

The spirit of indomitable youth still persists in a New York City employee who has just lost his job because he had arrived at the age of compulsory retirement. "They needn't think they can keep me from working with their old retirement laws," said the veteran, as reported in a daily paper. "I'll get me a job and do something, I don't care how often they say I'm too old to work. I'm not old at all. I'm only eighty-one, and I'll live a good many years yet. I never felt better, and I don't need any vacation or any rest. Monday morning

BY THE WAY—(Continued)

I'm going out to look for a job, and I'll bet I find one."

Speaking of the canniness of the Scotch, the "Ocean Times" says that one fine morning a small boy sat on the curb and cried his heart out. He had lost his weekly penny, and searched for it in vain. Presently an old Scot came along and offered comfort. "Dinna cry, lad-die," he said. "If ye dinna find it afore dark, here's a match!"

An ode on transportation is wanted by the Clark Equipment Company of Buchanan, Michigan, according to the "Railway Age," and the successful poet will receive a thousand dollars for his effort to idealize the mechanics of movement. Last year the same company which deals in automobile parts, gathered twelve paintings by well-known artists depicting "The Spirit of Transportation." It is now proposed to publish reproductions of these pictures, accompanied by the successful ode.

It is noted that four of the six judges of the contest are editors of strictly trade journals. Why not make Amy Lowell, Vachel Lindsey, and E. A. Robinson judges of a contest for the best designed carbureter?

The chiropractic practitioner comes in for several digs at the hands of the humorist of the "Journal" of the American Medical Association. This one in prose, from a letter received by a physicians' supply house:

Gentlemen: I cannot say for the present for you to keep me on your list or not in account of the new laws that is going to be ineffective in may. might or might not that we had to quit the proficiency of Chiropractic I will write to you later. Yours very truly.

This one in verse:

If your heart goes pitter-patter,
Do you know what is the matter?
Why your spine
Is out of line!
If you have a hob-nail liver;
If the ague makes you shiver—
Your poor spine
Is out of line!
.....
It's your spine—
Fatal spine!
But why pine?
That's the knack!
Hear it crack?
Now it's back—
Right in line!
Ain't it fine?

Overheard on a Thirty-fourth Street cross-town car in New York City: Passenger—"Conductor, this transfer to a Broadway car you have given me may get me into trouble. It reads—'On surrender of this ticket properly punched southbound Broadway conductors will issue you a retransfer,' and so on. Now I don't want to have to punch any Broadway conductor, properly or improperly." Conductor (an Irishman and ready to follow up a joke)—"Ah well, thim Broadway conductors is good-natured guys and maybe they'll let ye ride without takin' a b'atin'."

To Summer Resort Proprietors

The Outlook will devote a special section in its spring and early summer issues to advertising of summer resorts, tours and travel. This will appear every week during May, June, and July. The issue of May 24 will be the Annual Out-of-Doors Number containing articles on vacation subjects and illustrations especially selected. The corresponding issue of 1921 carried 198 advertisements of hotels and resorts.

Write us early and we will be
glad to give you copy suggestions

FITTING SOLDIERS TO FARMS IN CANADA

BY D. M. LE BOURDAIS

PHOTO BY THE CANADIAN SOLDIER SETTLEMENT BOARD

SOLDIER SETTLER'S DAIRY FARM IN PRINCE EDWARD ISLAND

"A nation on wheels, an empire in the commotion and pangs of birth"

"Vandemark's Folly" in combination with The Outlook for six months only \$3.50.

This Tremendous American Romance Has Captured the Country

HERBERT QUICK's great historical romance, "Vandemark's Folly," has stirred the whole country as few American novels ever have.

It is conceded to be an even truer and more moving story than "Richard Carvel."

It is the authentic epic of the Middle West, revealing with thrilling effect both the quaint glamour and the bitter, brutal realities that attended man's conquest of the soil—a marvelous revelation of the heart of America and the battling of its pioneers.

R. D. Townsend says in The Outlook: "It does for the open Iowa prairie country in the early settlement days, say from 1855 on, exactly what 'Main Street' didn't do for the small town. It gives a fair picture of men, women, and things."

You will need The Outlook more than ever during your summer vacationing. Due to a highly efficient change-of-address department, we can guar-

antee immediate action on all change-of-address orders received by us. Other periodicals often require from two to six weeks to make similar orders effective. But wherever you go vacationing, The Outlook will be there each week to keep you reliably informed as to the world's most important events. Many subscribers can dispense with newspapers during their vacations, but cannot get along without The Outlook.

The regular yearly price of The Outlook is \$5 (\$2.50 for six months); the book retails for \$2. This special offer saves you \$1. If more convenient, in accepting this offer you may make a first payment of \$1.50, and may send us \$1 per month for two months. Please mail coupon at once.

"Vandemark's Folly" contains more than 400 pages of thrilling and informing reading—wholesome and bracing reading for the entire family. It is brilliantly illustrated by Wyeth.

The Outlook Company, 381 Fourth Ave., New York

I accept your offer of The Outlook for six months and "Vandemark's Folly."

1. I enclose ☐ \$3.50. 2. I enclose \$1.50, and will send ☐ you \$1 per month for two months. ☐

Please check the offer you select.

MAY 10, 1922

THE INEVITABLE AT GENOA

THE Genoa Conference was supposed to be economic; it has been, in fact, so far mainly political. This has occasioned no surprise. Every one who thought about the matter realized when the Conference was called that questions of currency, and finance, and business credit, and international trade must wait upon decisions affecting the stability and solvency of governments, and in some cases even the boundaries of nations. So it has happened that the discussion at Genoa has proceeded from one political question to another, including recognition of the Bolshevik Government of Russia, the negotiation of a rudimentary alliance between Russia and Germany, the proposal of a treaty to establish a ten-year peace among the nations of Europe, and now the urgent desire of Lloyd George that the Conference settle the still unsettled frontiers in Europe.

With these political questions it is fortunate that the United States is not involved. The foresight of the Administration in declining the invitation to Genoa has been vindicated. America is interested in the political as well as the economic problems of Europe as never before; but she did not prove herself very well fitted for the task of settling them at Paris, and she has learned her lesson of hands off.

Though political questions have been in the foreground, there has been nevertheless a continual and not unprofitable debate over problems that are chiefly economic. Out of this debate there have arisen some tentative conclusions. One of these is the proposal to establish a European consortium for financing the commercial and industrial recovery of Russia. To the proposal of the Russian delegates that the Bolshevik Government be favored with a huge loan the other delegates were not enthusiastically responsive. As the sub-commission on Russian affairs declared in the draft of a preamble to proposals to Russia, which was adopted by the sub-commission on April 29, "Capital will flow into Russia as soon as confidence returns." But, as this sub-commission intimated, though privation in Russia is a menace to her neighbors, the rest of Europe can get along without Russia better than Russia can get along without the rest of Europe. In order to revive trade, this sub-commission reports that several European

Wide World Photos

LAWLESSNESS IN THE IRISH FREE STATE

An attempt on the life of Michael Collins was recently made when rails from this track were removed in order to wreck a train on which it was believed Mr. Collins was traveling to Wexford. He had, however, reached Wexford the night before, and so the plot was foiled. The train and passengers waiting to proceed are seen in the background while the track is being repaired.

countries have decided to institute an international consortium with an initial capital of twenty million pounds. Behind this capital, which would be raised by the "national corporations of each country," would be each country's whole financial resources. Of course all this plan is subject to conditions which would require a Russian Government that will keep its promises, protect property rights, stop undermining other governments, and in general abandon the present practices of Bolshevism. As to the payment of Russia's pre-war debts, the proposal has been made that the Chief Justice of the United States Supreme Court appoint an arbitrator to sit as chairman of a mixed commission to decide questions that affect foreign bondholders and Russia's ability to meet her obligations.

There has been a cloud of pessimism overhanging the Conference from the beginning. Repeatedly there have been reports of the imminent dissolution of the Conference. This seems to be what one must expect of international conferences nowadays. The Peace Conference at Paris was supposed by many observers to be on the point of explosion repeatedly. And the Armament Conference at Washington, according to some correspondents, was more than once on the rocks. Lloyd George has done something to confirm the feeling of pessimism

at Genoa, as he has warned Europe of the probability of war if the Conference does not do what he thinks it ought to do; and a message from the Pope has also brought to mind the fear of war as a probable alternative. What people need to-day, however, is not the stimulus of fear. They need rather a renewal of the passion for justice. Men who are governed by fear of war may do the very things that will bring on war; but men who are determined to do justly are likely to prevent war, and if war nevertheless comes they will face it fearlessly.

TROUBLE BREEDERS IN IRELAND

THERE are indications of willingness on the part of the irregular section of the so-called Irish Republican Army to cease the guerrilla warfare now carried on here and there spasmodically in Southern Ireland and to admit that the majority of the people of Ireland are willing to accept the Peace Treaty and the Irish Free State set up under it. But Mr. De Valera still rages obstinately against the acceptance of any Government which has not been indorsed by all of Ireland, including Ulster. He also demands that the general vote of the Irish people to send delegates to a constitutional convention should be postponed for six months. It is ardently to

be hoped that Mr. De Valera will find himself helpless to drag the minority of the Sinn Fein following into agreement with him on these points.

Such squabbling (for it deserves no better name) is the very food on which agitation and crime flourish in Ireland. Both sections of the Sinn Fein have to their credit, be it said, united in denouncing some of the most atrocious of the lawless acts which have recently taken place. The murder of General Adamson and the destruction of helpless people in Dunmanway are denounced by partisans of both sides as outrageous and terrible crimes. Yet it is certain that the many crimes of which these are typical will continue so long as an irresponsible body of men claim to act as an "army."

The crux of the whole situation in Southern Ireland is the coming election which will give the present Provisional Free State Government power and authority. The sooner it takes place, the better. After a majority of the people of Ireland have spoken, we may be relieved from constantly hearing of murders, burning of farmhouses, and such assaults as that which was recently made on Michael Collins, the actual head of the present Free State Government. A small body of irreconcilables can and will make a large amount of trouble and bring discredit on Ireland until the new Government is clothed with proper power to enforce peace. An indication that the people at large really want peace and progress was seen in the recent so-called "one-day strike" in Southern Ireland, which was really a popular protest against disorder and crime.

UNCHINAFYING CHINA

MANY things besides their proper names are hard to understand about the Chinese. The way the Chinese fight is one of them. Just at present there is in China a state of what, for the lack of a better term, we would call civil war.

As a matter of fact, there has been a state of civil war there for many months—that is, the Chinese form of civil war. It has not prevented business going on much as usual; it has not prevented the whole of China from being represented by a common set of delegates at the Armament Conference at Washington; and it has not prevented Chinese on opposite sides, even opposing leaders, from interchanging views on topics of common interest, or from being, in fact, personally quite friendly. All this is very different from our conception of civil war.

So also is the Chinese method of carrying on the military operations of such

a war. When two masters of chess engage in a game, they rarely fight it out to the final checkmate. When one of them finds himself in a hopeless position, he resigns. It is much the same when military chieftains engage in a contest in China. One of them maneuvers himself into a position which is to the other's disadvantage, and then the other resigns and much bloodshed and loss of property are avoided—theoretically. Practically, if the soldiers knew that they were going to be pushed to the point where they would have to fight the way that men fought in Flanders and in France, they would not fight at all. Their chief object in fighting is their pay; and whichever general pays the best wages not merely in promises but in fact has at the outset a great advantage. Of course there is some fighting, and there is bound to be a casualty here and there; but soldiers who are used to winning battles by maneuvering with the object of receiving a decent living are not going to fight the way soldiers do who are willing to face death for what they count a sacred cause.

Just now, however, the struggle seems to have become more acute, and the resulting loss in dead and wounded is reported to have resembled that of what we of the Western World know as warfare.

The objects for which the two military chieftains, Wu Pei-fu and Chang Tso-lin, are now contesting are, nevertheless, not such as to fire Chinese hearts.

There are some Chinese who look upon China with the same patriotic feeling that the great majority of Americans have for America, or Englishmen for England, or Frenchmen for France. The number of such Chinese has increased greatly in the last ten years and is increasing. Still that number is comparatively small. The mass of Chinese love their native soil, but they do not love China as China. There has been no China for which they have been willing to die. Fighting and killing on a large scale never characterized any war by Chinese "for China;" and yet never in history has there been such fighting and such killing as in China. It is estimated that the Tai-ping Rebellion cost in human life ten times as much as the World War. Chinese are willing to die when necessary. They are probably more fearless of death than many peoples who are willing to sacrifice life in a national cause. The pacifism of China is due to a lack of what we call patriotism, and it is perfectly consistent with a most tyrannous and corrupt form of militarism.

This is why China is what President Roosevelt called "Chinafied." It was not

because he was militaristic, but because he was anti-militaristic and at the same time patriotic that he warned his countrymen against Chinafying America. It is because there are Chinese that deplore both the militarism of China and the lack of patriotism of the Chinese that they are working to un-Chinify China.

Ahead of these truly patriotic Chinese there is a long task. With such Chinese all in America should be sympathetic. As between the two military chieftains who have their armies arrayed against each other now for the purpose of controlling Peking, the seat of the only generally recognized Chinese Government, there seems to be not very much to choose from the point of view of those who are looking for the creation of a real Chinese republic. Some Americans, recalling that Chang Tso-lin has a record as a bandit and a reputation as a tool of the Japanese, are hoping for a victory by Wu Pei-fu. Other Americans, knowing that Sun Yat-sen, the best-known leader of popular self-government in China, has formed a sort of partnership with Chang against Wu, are hoping that Chang will win.

Whichever wins, there is likely to emerge a more unified China and a more widely spread national consciousness.

SUN YAT-SEN'S NUTCRACKER

WHEN the Manchu Empire was overthrown in 1911, the succeeding Republic, so called, was hailed throughout the world, but the Republic failed to function. The old vested interests of the Manchu rule, unrivaled for corruption and incompetence, have never been ousted successfully by the new order. The old officialdom still practices its sabotage in the machinery of popular government. These standpatters of the old Middle Kingdom have formed the sinews and brains of all the reactionary moves on China's political chessboard. When Sun Yat-sen was made Provisional President, they maneuvered him into retirement and they brought about the elevation of Yuan Shi-kai to the Presidency and egged him on to declare himself Emperor. Then, with the re-establishment of the Presidency instead of the new and meaningless imperial office, there grew up the authority of the provincial military governors called Tuchuns. In the intervening years these Tuchuns have been brought under the domination of super-Tuchuns. One of these super-Tuchuns appeared, not in China proper, but in that northern dominion which China claims but has never controlled—Manchuria. This man, Chang Tso-lin, uneducated but brilliant, established a military power which the Japanese were very glad to make use of

but nevertheless feared. It has been the common report for many months that this super-Tuchun has dominated the Chinese Government at Peking. Meanwhile Sun Yat-sen and his supporters, among them the old experienced Wu Ting-fang, had established the Southern Chinese Republic. These southerners, raising the battle-cry of constitutionalism, have championed Chinese unification, and behind them is whatever may exist in the way of Chinese democracy.

Between this Republic of the south and the military dictatorship of Chang in Manchuria there has been a military power under the control of a super-Tuchun by the name of Wu Pei-fu. What this Wu wants is what all Tuchuns want—command of the wealth of the country. He has practically that in the region along the Yangtse River. Against Wu Pei-fu the Government at Canton has been helpless because of its lack of military power. Now, however, Sun Yat-sen has apparently made a bargain with the Manchurian military chieftain, Chang Tso-lin, and is undertaking to crush Wu Pei-fu by a simultaneous movement against him from the south and north.

The nominal President of China, Hsu Shih-chang, a futile old mandarin who issues edicts from Peking to which no one need pay any attention, has declared his Government neutral in this civil war. Could anything seem to be more ridiculous? That alone is enough to show how far China is from being a nation.

If Chang Tso-lin outguesses Wu Pei-fu, the question will then arise whether he will carry out his alliance with Sun Yat-sen. If he does, his victory will place the men of the south in a position to control affairs at Peking, and become, therefore, dominant in the political affairs of China as a whole. If Wu Pei-fu shows that he can outguess Chang, it may be that Sun Yat-sen will then make a bargain with him, and in that case the men of the south will get influence at Peking. In either case, will the liberal and democratic movement that has its center at Canton really be able to control the successful militarists? Undoubtedly a sense of nationality, patriotism, love of liberty, and an understanding of the privilege and responsibilities of self-government are growing in China; but they will not grow up in a night, or in a year, or in a decade. So far as we can see, there is nothing involved in the issue between these two super-Tuchuns who are fighting their game of military chess which will be likely either to retard or to stimulate to any great degree the development of China toward unity and freedom.

BLOW FOR BLOW

SOME of our readers who are not interested particularly in church organizations, who may be, in fact, rather bored by the discussion of subjects which church devotees find absorbing, may pass by as out of the field of their interest the statement printed on another page from a Commission of Christian Chinese. They may find it more to their liking than they think. It is a protest against the denominationalism which repels many Americans from the churches; it is a plea for genuineness in religious faith and life which many Americans, as well as these Chinese, fail to find because of the crust of tradition and cant phraseology; it is an affirmation of freedom to subject religious tradition and doctrine to the scrutiny of science, a freedom which many Americans believe is restricted by custom in this country and in other countries where Christianity has become crystallized into institutions; and it is a demand that religious faith express itself in insistence upon justice and mercy in both social and international relations. For generations America has been sending missionaries to China to strike at evils there. In this document Chinese have returned the blow and have struck at evils in this country. The blow is not aimed at America; but American sanctimoniousness and traditionalism, being in its way, cannot escape it. For the benefits which American missionaries have brought to China these Chinese are grateful; we have reason to be grateful in turn for the benefits which these Chinese Christians may produce in America.

AN INSPIRING EXAMPLE

SO much has been said in the press about the attitude of the churches, their lack of adaptation to the needs of the times and their emphasis on forms and externalities, that it is a great pleasure to record the experience of a church which under wise leadership has proved that these criticisms are at least sometimes unjust and that there is power in an old and wealthy church to adapt its ministry to changed conditions. The Church of the Holy Trinity, on Brooklyn Heights, has just celebrated its seventy-fifth anniversary. To this church, originally a beautiful Gothic building ministering to the needs of a wealthy congregation, came in 1904 John Howard Melish as rector. Conditions have greatly changed since the church was built. Many wealthy families have moved away from Brooklyn Heights, where Trinity Church was erected. Scarcely had Mr. Melish entered on his duties when the church was confronted

by a building problem. The beautiful spire was found badly disintegrated, and it became necessary to take down the whole spire above the belfry and much of the other exterior carving. The money was raised, but if the work of restoration was done the benevolent work of the church could not be provided for. The church counted humanity as of more value than the building, and the church was left without a spire. A guild house was erected. Special provisions were made for its use as a club-house. A superintendent was put in charge to direct athletics, and for seventeen years this club has held the interest of succeeding groups of men and boys numbering several thousand. A Girls' Friendly Society was added to the boys' club and other provisions were made for neighborhood work. The church, remaining true to its traditions, also remained true to that catholic spirit which often is, and always ought to be, characteristic of the Church of Christ, so that when, a few years ago, the ministers of different denominations in Brooklyn sought to obtain a general observance of Lent by a series of noon-day Community Lenten Services, Holy Trinity lent the use of its building for that purpose, and these services have been held since that time, generally attended by large congregations. We are sure that, measured by Christ's standards, the spiritual beauty of the work more than compensates for the loss of the physical beauty of the demolished spire.

BOWDOIN COLLEGE

BOWDOIN COLLEGE, at Brunswick, Maine, is one of the latest educational institutions to carry on a "drive" for funds. The authorities and alumni of that institution are endeavoring to raise about half a million dollars by July 1 next in order to obtain from the General Education Board an additional \$150,000.

Bowdoin deserves in a peculiar fashion the attachment and interest, not only of its graduates, but of the American people, because it was the Alma Mater of two of the most distinguished figures in American literature—Nathaniel Hawthorne and Henry W. Longfellow. The College was established in 1794 by an act of the General Court of Massachusetts, and Hawthorne and Longfellow were graduated in 1825. One of the Presidents of the United States, Franklin Pierce, was a graduate of Bowdoin, and Robert E. Peary, the discoverer of the North Pole, was educated at Bowdoin in the class of 1877, before he went into the United States Navy. In government Bowdoin produced Thomas B. Reed and Chief Justice Fuller. We

doubt if any college of its size in the United States has so large a percentage of internationally distinguished graduates.

Bowdoin has been in the past a distinctively literary institution, and we hope it will continue to be so. After all, literature, the record of human life on this planet, which enables men to know, as Matthew Arnold puts it, "the best that has been thought and said in the world"—we should add to this that literature is also the record of the best that has been done in the world—is the basis of true education. No amount of laboratories and machine shops, desirable as they are, can take the place of a literary atmosphere and influence in a scheme of broad general education.

Bowdoin is situated in a beautiful old New England town and has a delightful campus in which the influences of old traditions and of excellent examples of the modern architectural art are mingled. Atmosphere and tradition in education are two things that cannot be created by money alone. They require time and personality for their development. Bowdoin, fortunately, has a long and honorable history both in time and personality, and she can therefore contribute to the cause of education in this country some influences which newer and richer and bigger institutions can neither possess nor give. Scientific and industrial and vocational education, in which the United States is now the leader of the world, are eminently desirable; but the country ought not to forget those quiet oases in the hurly-burly of modern life which somehow or other do produce the type of men that Bowdoin has contributed to American civilization.

THE WAR POSTAGE ON SECOND-CLASS MAIL

It is not as well known as it should be that the present oppressive system of zone postage on second-class mail matter was adopted as an emergency war measure in 1917. There was a tacit agreement that the rates should be revised when the war pressure relaxed, but this understanding has never resulted in action. Under the law of 1917, passed without adequate hearing or investigation, the postage on newspapers and periodicals has increased year by year until it has reached the maximum fixed by the law, and is now continuing at that maximum.

For the first time in the history of the opposition to this special tax on intelligence, all classes of publishers who suffer from it have now united in a common attempt to procure justice. Newspapers and periodicals are getting together in urging upon Congress legislation which should repeal the last two

increases in the zone rates—that is, the two increases which went into effect in the years 1920 and 1921. This would cut in two the increases which have taken place during and since the war, and the result would be that the Government would even then receive 175 per cent more than the pre-war rates.

Other industries have received relief; common justice indicates that similar action should be taken in respect to an industry which is not carried on solely for the purpose of making money, but also for the purpose of disseminating knowledge, encouraging reading, and diffusing general education and interest in public affairs. It is because of this special character attached to the sending out of newspapers, magazines, and other periodicals that second-class postage rates was originally adopted. As the American Publishers' Conference states: "It is generally admitted that publications have become an inseparable part of our National life. There is nothing to supply the place of the home paper or favorite periodical, and nothing can compensate their influence. A vast majority of American citizens are dependent upon the press for intellectual companionship, because reading is the foundation of knowledge. The repressive policy of the Government as manifested in continuing war taxes is essentially uneconomical and demoralizing to the publishing industry and the reading public."

An address lately made by the First Assistant Postmaster-General, Mr. John

H. Bartlett, to advocate a "Postal Improvement Week," congratulates the Department and the people on the immense expansion of the Postal Service and its value to the country. Incidentally, Mr. Bartlett states that there are thirty-three million copies of daily newspapers printed every day in this country, a large portion of which are handled by the Department, and that the greatest efforts are being made to see that the people get their newspapers promptly and regularly. This applies, of course, also to other periodicals, and it is an indication of the value and importance of periodical publication to the country. The total business turnover of the Department is about three billion dollars. This enormous business is carried on at a slight loss—about three per cent of the turnover; but Mr. Bartlett remarks that "we have done better during the past year than for many years previous" in making the business pay. This, then, would seem to be an auspicious time for reducing measurably a tax which, as it now stands, encumbers and injures vitally the very purpose for which the special and lower rate was originally and wisely determined upon to aid the circulation of newspapers and periodicals.

BOSS CROKER

THE death of Richard Croker, perhaps the most famous of Tammany bosses, took place on his Irish estate, Glencairn Castle, to which he retired at the end of his political career with a

A CORNER OF THE BOWDOIN CAMPUS

fortune of at least \$2,000,000, probably a good deal more. Croker's rule over New York City was not of the rawly predatory character that marked the Tweed régime. We do not know that he was ever proved definitely guilty of personal bribery and corruption. But he was a power, and there was little done in the way of large contracts or improvements or special privileges without the boss and his Tammany associates having early knowledge and chances for profit. So the whilom boss finally lived in a castle and managed his race horses and his country estate in the land he had left as the emigrant child of a village blacksmith.

Mr. Croker's early career was typical of that of the gangster of New York City in the period after the Civil War; he lived in a squatter's shanty at first, became a machinist, then a volunteer fireman (one of the surest old-time methods to get political "influence"), then leader of the Fourth Avenue Tunnel Gang, then a political henchman, and so on through various minor political offices, until John Kelly's death gave him a chance to seize the reins of Tammany Hall. Once he was accused of killing a man in a brawl, but there was little or no evidence, and the case was dismissed.

It may be said of Richard Croker that he was no hypocrite; he held firmly that the spoils belonged to the victor, and he played the game fairly according to its rules as he understood them. His power over men was largely due to the fact that his word was good and that he would stand by his friends through thick and thin.

The day of the old-type individual boss in the great cities has largely passed away; the power of political influence and dictation is still there, but it has been put into commission, so to speak; a coterie or combination with a plausible and nominally respectable man at the head takes nowadays the place of the Boss Kelly or Boss Croker of forty years ago. Perhaps the danger to a city's welfare is more insidious, but it is not quite so bold or brutal.

A PLEDGE TO BE FULFILLED

WE suspect that a reference to the "Selective Service Act" will cause some of our readers to think twice before they are able to define exactly this epoch-making measure. The center of our attention has shifted greatly since 1917.

There are some, however, who have not forgotten this measure or what it meant to them. They are the officers and enlisted men who, under its provisions, entered the armies of the United States when we took up the gage of battle in the World War. Some of those

(C) Keystone

MARSHAL JOFFRE WELCOMED IN NEW YORK CITY

The famous French Marshal is here seen with Gaston Liebert, French Consul-General at New York, on the Marshal's arrival from the West

who have particular reason to remember this measure are still in hospitals or are still suffering from the poison gas and shells which shattered their lives. Those disabled men who are also officers are pointing at the clause in the Selective Service Act which reads: "All officers and enlisted men of the forces herein provided for other than the Regular Army shall be in all respects on the same footing as to pay, allowances, and pensions as officers and enlisted men of corresponding grades and length of service in the Regular Army." As the Commander of the Association of Disabled Emergency Officers of the World War has pointed out: "The only pension allowed officers of the Regular Army for disability is retirement pay—and Congress told the emergency officer, by this act, that he, too, was to be pensioned in like manner—by being retired." Emergency officers in the Navy and the Marine Corps are already cared for on a basis on all fours with this provision. So also are those men who accepted provisional commissions in the Regular Army, although in training and experience they differed little, if any, from the men classed as emergency officers. It seems only fair that the emergency officers should be similarly taken care of.

There is a bill known as the Senate Bill 1565, which extends the right of retirement to emergency officers who suffer from at least thirty per cent permanent disability. It provides that their retirement money shall come from the Veterans' Bureau, and not from the retirement funds of the Regular Army—a provision designed to obviate opposition

from the War Department. The bill has already passed the Senate. It seems right that it should pass the House and receive the President's signature.

Something of the experiences and mental attitude of our soldiers is shown in an article, written by a wounded officer who has spent more than two years in Governmental hospitals, which we hope to publish in an early issue. It is a plea for understanding which will move many.

JOFFRE

EVEN the title *Maréchal*, which denotes the highest military grade in the French army, seems not quite worthy of the man whom America greeted for a few days on his second visit to this continent and then bade farewell to as he sailed on April 29 for his home. There are some men whose simple greatness makes titles seem shabby. Joffre is one of these.

What proved Joffre's greatness was not a long career, but virtually a single and supreme act. And that act was not merely the product of military genius. It was the natural fruit of a moral character.

When the Germans began their assault upon France, there was but one thing for the French to do. They mobilized their armies according to the plan which had been prepared by the French Staff for such an exigency. Relying upon the neutralized territory of Belgium as a barrier against attack, the French had arranged to place their armies at the exposed frontier to the south of Verdun. When the orders for mobilization went forth, they could not

be revised. Meantime, while the German armies swept up through Belgium unopposed except by the few troops that could be thrown in their way by the French, the Belgians, and the British, Joffre swung his troops around on Verdun as a pivot until the line stretched east and west between Verdun and Paris. There was time then for an advance from that point to meet the Germans. If the Germans could be encountered near the Belgian frontier and driven back, northern France would be saved. What pressure was brought upon Joffre to do this no evidence is needed to make clear; it can be imagined. Why leave this beautiful and rich portion of France to be ravaged by the Boche? It is easy enough for a man to sacrifice himself in order to attain a great object; but it requires simplicity, singleness of mind and heart, and great courage to sacrifice for a great object what Joffre was called upon to sacrifice—a great area of his beloved country. There between Verdun and Paris he waited. The Germans, counting on the volatile and impulsive character they attributed to the French, expected to find the French armies coming out to meet them, and so they sought the French flank somewhere between Paris and the coast; but they sought it in vain, for it was resting securely on the Fortress of Paris. Compelled, therefore, to attack in the center, they met their defeat; for there the resilient and impulsive character of the French soldier, which Joffre knew how to use when the time came to use it, showed itself in the rush upon the Germans even after the French lines were broken, and turned a seeming rout into the victory which four and a half years before the armistice won the war.

In this moral quality there is a resemblance between the French marshal, Joffre, and the American general, Grant, whose character as a military leader is the subject of an editorial on another page. It was exceptionally fitting that, just before his departure, Joffre should have been the chief figure at the unveiling of Grant's bust in the Hall of Fame, at New York University.

To Joffre, the great soldier and greater man, America owes the security which enabled her to prepare for her part in the final victory. The tribute which this country paid to him on his recent visit was one which may have fatigued him, but one which we hope he recognized as genuine and as fresh as that tribute which America paid him on his visit during the war. And it was a tribute to him, not only as a soldier and a man, but as a Frenchman. It was a recognition on the part of Americans of what they owe to the genius and spirit of France.

ON TRIAL FOR TREASON

IN the ancient court-house of Charles Town, West Virginia, in which John Brown was tried and convicted for treason against the United States, there have been arraigned for trial a number of labor leaders, officers of the United Mine Workers, on charges of treason against the State of West Virginia; with many others they are charged with murder also. We recall no other prosecution for treason against a State since 1787, when the leaders of Shays's Rebellion were convicted in Massachusetts, but not executed. The inciters of the Whisky Insurrection, Aaron Burr, John Brown, and Jefferson Davis were indicted for treason against the United States.

The nature of the treason charges, the events that led to the indictments, and the fact that those events were the culmination of a bitter struggle between the unions, striving to organize the West Virginia coal fields, and the operators, striving to keep the unions out, make the trials of National interest and of industrial significance.

Apportion blame and sympathy as one chooses, it is beyond dispute that we have had nothing since 1865 so closely resembling civil war as the march of the union miners and their sympathizers, last August and September. This invasion by several thousand men was met by forces of deputy sheriffs, State police, and armed citizens; machine guns as well as rifles were used; for nearly a week skirmishes took place; there was at least one pitched battle; only by the intervention of Federal troops was the trouble stopped and the miners disarmed and sent home. So strong is the hostile feeling to-day in Logan County, at which the invasion was directed, that when indictments were found it was necessary to ask for a change of venue to Charles Town, two hundred and fifty miles away. Nine of the prisoners, press accounts state, were brought to court handcuffed and chained, with a deputy sheriff holding the end of the long chain like a driver.

Treason against a State is defined much as is treason against the United States. It is alleged that these labor leaders raised forces and waged war against the State, that they defied the martial law that had been proclaimed in Mingo County (adjoining Logan), and that they counseled, aided, and abetted (constructively at least) in the killing of a certain deputy sheriff. Insurrection, robbery, and conspiracy are also charged. One young man, William Blizzard, the head of a sub-district of the United Mine

Workers, has already been put on actual trial.

The prosecuting attorney declared his intention "to show that the purpose of levying this war on the part of the defendant and his co-conspirators was to destroy the sovereignty of West Virginia in the counties of Logan and Mingo." On the other hand, the defense's attorney declared that the coal counties of the State were notoriously ruled as an industrial autocracy through a vicious company-armed-guard system. He added: "The individual turmoil which has so long disgraced this section is a direct result of this system. It is a tribute to the sterling Americanism of the hardy mountaineers that they do not tamely submit to a forcible deprivation of their civil rights by an army of company guards. Governor Morgan was elected on a platform pledging the abolition of this system."

What kind of civilization, what kind of individual initiative, is there in a West Virginia mining "camp"?—they don't call it a town. One of the editors of the "Survey" in that paper's recent "Coal Graphic" number made a striking picture of things as he found them:

No one owns his own house; he cannot acquire so much as title to property. No one runs a store, operates a garage, or sells groceries or haberdashery to his fellow-townsmen. No one amuses them in a movie theater. . . .

It is not quite accurate to say that no one does these things. The coal company does them all. It owns all the houses and rents them to the miners. It owns the store, the pool-room, the movie theater, and often helps to build the school and the church. It often owns the Y. M. C. A. building, if there is one. The company employs the physician and collects a small sum monthly from each miner to help pay him. Sometimes it supplements the salary of the teacher and assists the minister in making both ends meet.

The company owns all the land and everything upon it. It therefore controls the life and activities of the little community. It is responsible for the sanitation; if sewage disposal is adequate, the credit belongs to the employer.

The company's ownership sometimes extends to the roads, so that it can control ingress and egress. In some counties the company is the employer of the deputy sheriffs, and is therefore responsible for police supervision. In Logan County the operators paid out \$61,000 last year, as the president of the Logan Coal Operators' Association testified before the Kenyon Committee, in salaries for deputy sheriffs.

The defense contends that the miners' march was not against the State or its sovereignty, but against "repression of free speech and free assemblage and the other intolerable conditions maintained

by the operators in the mining districts." The prosecution avers that the mine-owners were entitled to protection from the State, and that the march was an attempt to unionize the miners by force.

It would be improper and unfair to comment on the issues and evidence of a criminal trial before they go to the jury. One thing, however, is just plain Americanism: Order must be preserved and disorder punished. But it must be done by the responsible officers of State or Nation. There has been an overbearing attitude among both unions and capitalists. Associations of both kinds have been laying down the law and enforcing their own behests. The public will not endure too much of this. Mr. Gompers has lately made the greatest error of his life in saying that organized labor has no use for the courts. On the other hand, we want no private armies, generated and paid by employers. The right of free speech and free peaceable meeting and discussion is not worth much if the decision as to what those rights mean is to be left to privately paid armed guards or if one party to an individual dispute is allowed to pay deputy sheriffs. The New York "Tribune" asserts editorially: "It was the purpose of the leaders of the Mingo marchers to organize Logan and Mingo Counties by force, but the coal operators of those two counties had previously, and since then have, resisted by force even a discussion of unionization."

The courts and the Legislatures still function; to them and to public sentiment must be left the task of deciding what should be done to lessen the tyranny and obstinacy of unions of labor and associations of capital whenever and wherever injury to the community's interest exists.

A MATTER OF NAVAL MORALE AND NATIONAL SELF-RESPECT

AN adequate navy may be defined as consisting of the right number of ships with the right sized crew, with the right kind of spirit. The Armament Conference provided for the right number of ships. Congress seems to have set its heart upon destroying the two other factors in our definition.

Some of the possible danger to the spirit of the Navy may be glimpsed in a letter which came to us not long ago from a naval officer's wife. She writes:

We have no vote, we have no political power, therefore we are the only direction in which economies can be made. We do not feel at all that

our end is due to the wholly admirable Hughes or the Conference, you see. But, if we must be eliminated for politics, can't it be done with dignity? It seems incredible that, as we have heard, we are to be cut and cut in pay until we have to resign to exist. My husband, with many others, was demoted in January, losing the rank he won in the war and \$70 a month. Now we are all to have another cut in June. Here is our personal dilemma (and I know of many others much more serious): Our boy's teeth-straightening must stop, our application for a good school for him in 1923 must be withdrawn, he must be taken now from an excellent school here (giving the first adequate instruction of our roving lives) and placed in a particularly poor public school, we must give up some or all of our precious life insurance, we must go in debt for uniforms (bha!), and we must sell at a great sacrifice our home in New York State, which we inherited and which has been in my husband's family for many generations. For the lack of enough to pay the upkeep, we must lose all we had to depend upon for old age. Through all the years of deprivation, separation, and striving to keep out of debt, Service people have cherished the idea that theirs was a very honorable calling and that eventually they would be given enough to pay the expenses of their difficult, expensive, transient life. The war seemed to bring this consummation nearer—and now!

In replying to this naval officer's wife, we suggested that we might wish to publish some of her letter in The Outlook. She has written us again:

It occurs to me that some one may say to The Outlook, as is frequently said to us: "But look at Captain and Mrs. Blank and the So-and-So's. Don't tell me Navy people are poor!" This is a most unfortunate feature of our plight and a difficult one to speak of. More and more are our officers marrying rich wives. And that is the Prussian system, isn't it? More and more of them are going in debt, and the younger ones marry with the idea that children are out of the question.

One of the saddest features is the long separation of families, for the wives are no longer able to follow the ships or to meet their husbands in any port that the ships may be in for weeks or months. They have not money for traveling expenses, nor for the cheapest boarding-places.

An item which those in civil life never think of is the constantly recurring expense of moving, which normal housekeepers know only once or twice in a lifetime. Each time a family moves and resettles there is both the big initial expense and the cost of stocking a house. Innumerable times I've given or thrown away remaining groceries and standard provisions only to duplicate them in a new place in a few days, weeks, or months.

And now the income tax, from which we were exempt during the war, is again visited upon us. And the very best Senator Wadsworth (our

true friend) can hope to get for us—the best, mind, and they doubt being able to get that much—is less than we have had these last two years.

Ah, well!

Accidental financial reverses and disaster come to people in all walks of life. But such a change in the standard of living as is portrayed in the extracts from the letters which we have published here are changes which are products of a real and controllable injustice. Officers of the Army and Navy have never been paid in accordance with their responsibilities. In a partial exchange for this low standard of pay they have had permanent employment, assurance of retirement pay, and last, but not least, the satisfaction of performing a public service. The dangerous cut in the naval personnel and the reduction in pay will do much towards the elimination of this intangible but powerful benefit. According to an estimate upon which we think we can rely, the maintenance of a Navy with a personnel in accordance with the treaty ratio would cost each person in the United States less than one dollar a year. Even if Congress in its wisdom decides to ignore the ratio established by the treaty, it should at least do what it can to keep faith with the naval personnel which remains.

ULYSSES S. GRANT

WISE men learn from the experience of others, fools learn only from their own," is an old proverb. There is one lesson which we may all wisely learn from the life of General Grant, which began a hundred years ago—he never assumed a responsibility which did not belong to him, and he never evaded a responsibility which did belong to him.

It is difficult for the men of this generation to comprehend the perplexity of the problem which confronted the people of this country at the outbreak of the Civil War. The issue seems simple to us now, but not so then. There were Union men in the South and secessionists in the North, men who did not believe in slavery fighting to extend it and men who were indifferent to slavery fighting to overthrow it, men who were passionately determined to retain the seceding States and men who wished to let the erring sisters go, men to whom compromise was more abhorrent than war and men to whom war was more abhorrent than compromise, and men who were dazed by the sudden catastrophe and wondered what it all meant. "What are you-uns coming down here to fight we-uns for?" asked a captured mountaineer of his Northern captor.

The Union army shared this per-

plexity. Some Union generals returned fugitive slaves to their masters and promised to put down slave insurrection with an iron hand; others accepted fugitive slaves and set them to work digging earthworks; and two generals issued emancipation proclamations. The proposal to arm the slaves and enlist them in the Northern armies aroused in Northern circles great enthusiasm and equally great indignation. General Butler's ingenious solution of the problem was largely accepted; he said fugitive slaves were contraband of war, and the term "contraband" remained a popular title of free Negroes throughout the war. Some men entered the war furious at the leaders who had endeavored to destroy the Union, some with a sincere and patriotic desire to fight as little and as gently as possible, so as not to increase the sectional hostility. Seward's device to provoke a war with England so as to unite North and South in a common defense furnishes a curious illustration of the futile hope entertained by some in the North that the Civil War might somehow be made inconclusive and short-lived.

When the Union was threatened by Civil War and the guns of the revolutionists were turned on Sumter, Captain Grant tendered his services in defense of the country which had given him his education, and from that time to the end he was animated by a single desire—the desire of a soldier to win the war. All political questions he left to the political authorities. He promised neither to return fugitive slaves nor to emancipate them. What his views were about slavery were not, I think, given to the public.

These views certainly did not enter into or in any way affect his campaigning. He was a soldier; the soldier's

responsibility he took, and he took no others.

In a letter to his father from Corinth, Mississippi, August 3, 1862, he wrote:

I am sure that I have but one desire in this war, and that is to put down the Rebellion. I have no hobby of my own with regard to the Negro, either to effect his freedom or to continue his bondage. If Congress passes any law and the President approves, I am willing to execute it. Laws are certainly as binding on the minority as the majority. I do not believe even in the discussion of the propriety of laws and official orders by the army. One enemy at a time is enough, and when he is subdued it will be time enough to settle present differences.

At first he had no soldiers under him, only the material out of which soldiers are made. His first engagement was the capture of Belmont. It could be only temporarily held, however. The raw troops were disorganized by their victory. Instead of pursuing the enemy they set about plundering, while their colonels shouted and made stump speeches for the Union. Before they could be reformed they were surrounded by Confederate troops reinforced from the river. The intelligence was brought to Grant, whose reply was: "If that is so, we must cut our way out as we cut our way in." They did so, and he was the last to land on a transport protected by a Federal gunboat. I was at that time living in Indiana, and well remember the enthusiasm with which we greeted the report of his response to a suggestion of surrender: "We have whipped them once, and I think we can do it again." It gave courage not only to his troops but to the people of the Northwest, who were impatient with the slow progress of the pick-and-shovel campaign conducted by more conservative generals, and who instinctively

felt, what General Grant subsequently affirmed, that when neither party is well disciplined nothing is gained by delay. The one party can take advantage of delay as well as the other. The same eager and adventurous spirit accomplished, without orders or, I believe, even permission from the cautious Halleck, the unconditional surrender of Forts Henry and Donelson in the Cumberland River, which gave to General Grant throughout the West the sobriquet of "Unconditional Surrender Grant."

A year and a half later came the surrender of the Confederate forces to General Grant of what had been supposed by friend and foe to be an impregnable fortress. The Vicksburg campaign has always seemed to me the most romantic feat of the Civil War. I refer to it here, however, not to emphasize the generalship which planned and accomplished this result, but because it illustrates in a remarkable manner the type of courage which from start to finish characterized General Grant. To run a fleet of gunboats and transports past the batteries at Vicksburg when "only two of the steamboat masters were willing to encounter the danger," to undertake this hazard only with volunteers (and only such were taken), then to cross the Mississippi below Vicksburg and put the Federal army between two Confederate armies, one in Vicksburg, the other coming to its relief, to whip the one and then capture the other, required the kind of courage which takes responsibilities and invites risks of disastrous failure, risks to others as well as to one's self, in order to achieve success. This seems to me, when accompanied by good judgment and wise supervision of details, to be perhaps the highest form of courage known to history.

LYMAN ABBOTT.

FIVE MEN THAT EUROPE WATCHES

THE OPENING HOURS OF THE ECONOMIC CONFERENCE

EDITORIAL CORRESPONDENCE FROM GENOA

BY ELBERT FRANCIS BALDWIN

WE are in the Palazzo San Giorgio, a picturesque building dating from 1200 and the century-old seat of the Genoese merchant princes. There were doubtless enough seats in the hall for the princes; but there are not near enough seats up here for the hundreds of journalists now in Genoa. Doubtless the Genoese did not expect so many.

Below is spread out an enormous green-covered table, parallel with the

sides of the room. The table is very much larger than the one I saw at the Washington Conference—indeed, at the sides are double rows of seats for the delegates to this International Economic Conference, in addition to the seats at the top and bottom. Back of all these are the seats for the attachés and experts and other notabilities; here, again, the seats are very many more in number than at Washington.

The people are assembling. At the

middle of the table opposite me at the other end of the hall is the Italian delegation; to its right the French, and to its left the British. Beginning right and left down each side of the great square are the Japanese and the Belgians, respectively. Now the Germans are coming in; they are being shown places quite down the side—rather a change from their expected position in the world when they began the late war. And now, most curiously awaited of all

come the Russians and appropriately find their seats at the bottom table, as becomes the humblest. To the general surprise, among their subordinates they introduce two women, and these women, like most of the other Russians here, vaguely recall Tartar and Mongol types.

Just under where I sit are two nobler figures. Monsignore Signori, Archbishop of Genoa, in his crimson robe and red beretta, is speaking with General Gonzaga. Heroic in size, a blaze of decorations covering his breast, the General wears more proudly an empty sleeve. In this vast room, with place for a thousand persons, these are the most striking figures. But, if I do not miss my guess, they will seemingly decrease in apparent size and importance and the figures of certain civilians will become proportionately great.

One of those civilians, a man hitherto unknown in America, now rises in the middle of the row opposite me. He is calling the Conference to order. He is the Prime Minister of Italy and the head of the Italian delegation. His name is Facta. With his long white mustache in a grand military sweep, he looks like a cavalry officer who has left his uniform at home. But he speaks like a hard-headed Wall Street man. That is the kind of business person they raise in this business town of Genoa and in the adjoining province of Piedmont, from which Facta comes. Giolitti, also a Piedmontese, and many times Premier, is such a person too. It may be held that he is really Prime Minister now, for Facta has long been his lieutenant. That does not mean, however, that Facta, sixty-one years old, has not made his own mark. He has. He was hardly over the prescribed age when he became Consigliere Comunale, or city father of

his home town of Pinerolo, and was not yet in the thirties when he was made Pro-Sindaco, or Vice-Mayor. For nine terms he has been a Representative in Parliament. A lawyer and jurist of distinction, he has been valuable there, as also in various Cabinet positions, especially as Minister of Justice and Minister of Finance. A Radical Liberal, he enjoys the confidence of all parliamentary groups, and now he is making a further favorable impression by his short address of welcome (immediately translated into English and French); and by his longer inaugural address as President he will doubtless deepen that impression.

David Lloyd George, British Prime Minister and head of the British delegation, now rises to propose Facta as permanent President of the Conference. Lloyd George is no sooner on his feet than he receives the compliment of dead silence and intense attention, as, indeed, is due to the dominating figure here; for to him more than to all others put together is the credit for calling this Conference—perhaps he wants it to cloak his hitherto very questionable Russian policy. His is an ungraceful figure; a massive man, he seems like a chunk from an oak-tree trunk. His face is softened by his yellowish hair and mustache, by the merry twinkle in his eye, and by his ready smile. From that massive frame you rather expect a bass voice, and are surprised at hearing a tenor instead. As its Welsh owner uses it without the usual English hesitation—the guttural hemming and hawing—the voice has a grateful sound. It produces just the tone needed for the ingratiating and persuasive effect desired.

And now there rises the appropriate seconder of the motion, a virile figure,

the energetic ex-Premier Barthou, head of the French delegation. His is the most resonant and sonorous voice so far.

Of course Facta is chosen, and of course he makes an admirable inaugural address.

Now Lloyd George rises again. In his hand he holds a lot of notes on little slips of paper and whips on his glasses to consult them. Then he whips off his glasses and speaks directly to his audience for a moment, only to repeat the process. His gestures are not remarkable, the favorite one being to slap one hand upon the other. He speaks with great clearness and lucidity.

Then Barthou. He made a ringing speech. Then Ishii, the head of the Japanese delegation, whose speech was read for him in French by one of his subordinates, and in such amazing French that a near neighbor of mine sighed: "*Mon Dieu, comme c'est difficile de comprendre le japonais!*" Then a terse speech from Theunis, head of the Belgian delegation, received with much applause, in which it was easy to see a persistence of the special sympathy for his outraged country.

When the president announced that the German delegation had the floor, particular interest was manifested. The worthy Wirth, Chancellor of Germany, arose, but speedily wore out the patience of the audience as soon as it had satisfied itself with a good look at his solid and portly person. Perhaps the memory of the tragic treachery at Gleiwitz a day or two before, where twenty French soldiers had been slaughtered—a foretaste of the war of revenge—made him keep his voice low in a speech about three times too long. As to the length, one of my companions whispered: "Wirth is trying to make up for the international conferences from which the Germans have been excluded." As to the conciliatory matter of the speech, however, a neighbor on the other side muttered contemptuously: "*Ces ne sont que des phrases*"—they are only phrases; meaning that the big Württemberger's generalizations had nothing to do with the particular things he wanted to "put over." The long address was then read by a German "expert" in indifferent French and English. People were getting impatient. Popular interest here has not concerned itself very much with the Germans in general, anyhow. They have been discounted in advance. The man in the street felt that he knew thus about what the Germans would say. But he did not know what the Russians would say. Hence the greater interest in them. Anyway, what a difference between lively Lloyd George and ponderous Wirth!

And now comes the Russians' turn. Tchitcherin rises. He is Bolshevik Minister of Foreign Affairs and vice-head of the Russian delegation, Lenine reserving the headship for himself, should he decide to come. Tchitcherin has a rather tall, somewhat stooped

figure, inexpressive eyes, and monotonous voice, and yet we, who had expected to find a typical Bolshevik, are surprised to see revealed rather the more aristocratic person once in the Czar's service. There is also another surprise: Facta, Lloyd George, Barthou, Wirth, have spoken in their native tongues. Thus Tchitcherin? Not he! He knows that it would not get him anywhere. He speaks—or rather in-ones—without hesitation, but also without haste, in beautiful French. Now that he finishes, he immediately begins again and delivers the speech once more in beautiful, if somewhat labored, English! The speech is a generalization as to economic Russia and her importance in the world. But Tchitcherin (the Italians pronounce it as we do, but they spell it "Cicerin," which looks simpler) also proposes the consideration of a subject which he must very well have known had been excluded from the agenda—the official list of subjects to be considered at the Conference.

This brought instant thunder from Barthou. Evidently he plays with all his cards on the table and face up! A member of the French Academy, he knows precisely how to describe what those cards mean. He is speaking with sharpness and severity. Perhaps he might be less categorical and peremptory; perhaps it is not necessary to hammer out each syllable, as a meticulous schoolmaster would do. But what would you? There are the Boches and the Bolsheviks right in front of Barthou, and Tchitcherin's proposal shows how ready they are to trip up the order of the Conference to the discomfiture of the French.

Now comes again the Lloyd George sonor voice. Oil is being poured on the troubled waters. How would the Welshman's far-famed opportunism now show itself? We are apparently listening to a paternal address. It now becomes a friendly conversation, and now an after-

dinner speech. Lloyd George is humorous, ironical, jovial, serious. In his earlier "set speech" he has already shown the combination of these qualities, saying that a citizen of Genoa was the discoverer of America and, "as Genoa discovered America to Europe, I am hopeful that Genoa once more will render another immortal service by rediscovering Europe to America."

Amid the startled and angry countenances all about him, Lloyd George now remarks that "there is nothing more explosive than a Peace Conference." Somehow, this seems all of a sudden to warm the austere hall of the ancient merchant princes, whose colossal statues have been coldly looking down upon us from their niches. The Welshman supports the Frenchman but appeases the Russian by gentle banter. Finally, Lloyd

George lets down Tchitcherin with a dull thud. Still in apparently tender tones, but now with menace in them, he warns: "The European ship is too heavily laden. Do not add to the weight, Mr. Tchitcherin. It might sink the ship and perhaps you would be one of the drowned. Finish this voyage without trying to put your hand on the rudder. We will welcome you on another voyage when we know what kind of a passenger you are."

The Conference will need Lloyd George's nimble brain and lambent wit to steer straight through its complexities of subjects, but especially to steer straight through its varying and variable human makeup. Lloyd George can help it do both, because he is both politician and statesman. A politician knows men, and he knows men. A statesman knows about things, and so does he. But a man who really knows men through and through, as Roosevelt did and as Lloyd George does, a man who does not know men only half-way, as do most so-called politicians, is perhaps harder to find than is a statesman. So Lloyd George may not be far wrong when he says that he has known many statesmen but few real politicians.

The Conference will need even more, I believe, the backbone of a Barthou, who cannot forget the scorn of another ex-Premier's words, those of Clemenceau, "We do not treat with criminals." Yet if France is now represented at Genoa and America not, it is because the position of France is very different from ours, no matter how great the basic feeling of friendship between the two Republics.

At all events, on the opening day of a great international Conference like this, could you get together as chief representatives five more differing men—the shrewd Briton, the incisive Frenchman, the very up-to-date Italian, the solid Teuton, the mystic Slav?

MOTHER THOUGHTS

BY MARTHA M. F. HUBBELL

I WOULD go proudly
And bow my head no more.

How can I walk humbly
Before High God,
Bearing on my shoulders
This immeasurable load?

My burden of the loss of him,
So great it is, and sore,
I must go proudly,
And bow my head no more.

FITTING SOLDIERS TO FARMS IN CANADA

BY D. M. LE BOURDAIS

IN the autumn of 1917, like many another Canadian soldier's wife in those war-weary months, Bertha Stauffer, of Leduc, Alberta, received the dread intelligence that her husband had made the supreme sacrifice; and she realized that she was left alone to face the future, with her two boys, six and seven years of age, to support and educate.

While the pensions which Canada pays the dependents of soldiers who died as a result of service overseas compare very favorably with those paid by any other country that participated in the war, and in most cases are more generous, they are at best only a guaranty against actual want; they are not capable of supplying the little luxuries which by most people are nowadays considered necessities. And, be that as it may, Mrs. Stauffer was a true mate for a warrior; she was not content to sit quietly and live upon the proceeds of a pension.

As it happened, early in that same year Parliament had passed an act with the double object of re-establishing re-

turned soldiers into civil life and increasing the supply of agricultural products. Food-rationing was at its height, and a concerted effort was being made to place every available acre under cultivation. Many men were being discharged from the army unfit for further fighting who had had previous experience on the land and whose disabilities were not sufficiently serious to interfere very greatly with farming operations. But two or three years' absence from Canada and the financial sacrifice usually entailed thereby rendered it practically impossible for the great majority of these men to acquire the necessary equipment. Therefore provision had been made whereby duly qualified returned soldiers could receive loans from the Government for the purpose of purchasing raw or improved land, providing live stock and implements, and making permanent improvements.

Originally this financial assistance was designed only to enable those soldiers who had filed on the free homesteads of the northwest to secure equipment and make improvements; but, the

free lands proving less extensive than was at first taken for granted, the scheme was made applicable for the purchase and improvement of raw or improved lands in any part of Canada. To administer the act a board of three commissioners was created and local advisory committees were appointed in the principal centers throughout the Dominion.

The Soldiers' Settlement Act being applicable to women, either the dependents of soldiers or those who had themselves taken an active part in the war (such, for instance, as nurses), and having been reared on a farm, Mrs. Stauffer decided to take advantage of the provisions of the act. She looked around for a suitable piece of land, and near Sexsmith, Alberta, in the far-famed Peace River District, finally succeeded in locating a nice half-section—one quarter-section as a homestead, and the other by virtue of her being a war widow. It was good land, but much of it was covered with brush and would require clearing.

By this time the season of 1918 had

ALBERTA SOLDIER SETTLERS' WIVES IN CONVENTION. SEVENTY WOMEN AND TWENTY-EIGHT BABIES CAME TO RED DEER FOR THIS CONVENTION. MANY OF THE WOMEN HAVE RECENTLY COME FROM OVERSEAS TO MAKE A HOME IN THIS COUNTRY

Instruction on subjects of interest to women on a farm home was given and entertainment was provided by the people of Red Deer. Transportation was paid by the local branch of the Red Cross at Red Deer

practically passed, and not a great deal could be done in the nature of agricultural operations that year; but the Government advanced a preliminary loan of \$300 in order that a start might be made in clearing and breaking the land and assembling some of the materials to be used in the construction of the farm buildings.

To the city dweller there can be nothing more desolate than the picture of one of these new homesteads in the Canadian northwest. It is probably a considerable distance from the nearest railway and the nearest village—or it would not be open for homestead purposes. Generally speaking, the homesteader must be a real pioneer and must expect to go beyond the thin fringe of civilization. When he first arrives upon his location with his initial supply of building materials and his inadequate farming equipment and sits down beside the small heap which they make upon the face of the countryside, and looks forward to all the hardship and toil that are entailed in his proposed attempt to carve out a home for himself and his family, his makeup must indeed contain no small element of the heroic if he is not to waver in his determination.

Early the next spring Mrs. Stauffer was back at the homestead. The Board had granted a further loan of \$1,500 for the purchase of live stock, farm implements, fencing, and building materials. Before the end of April the little dwelling was sufficiently near completion for her to move in. Up to this time the work had been done under the supervision of the field staff of the Soldiers' Settlement Board, but now Mrs. Stauffer took personal charge of her homestead and hired a capable man to do the heavy work. Of course she still had the benefit of the advice of the Board's supervisor, whose duty it was to make periodical visits.

It was not possible that first season of actual farming to get much land under crop, as there was so much unproductive work to be done, but six acres were seeded to oats. And during the summer the clearing and breaking continued. The last loan having been expended, and, in the opinion of the Board, wisely expended, an additional loan of \$1,000 was granted in July to enable her to buy horses and cattle and to complete the buildings. By October fifty-six acres had been broken, a mile and a half of fencing had been erected, and forty tons of hay had been cut and stacked.

Needless to say, the revenue from the farm that first year was not very great; but Mrs. Stauffer had raised sufficient feed to maintain her stock throughout the winter, and from the sale of cream, butter, and eggs was able to support herself and her boys.

The homesteader's life, however, is beset by many anxieties. Mrs. Stauffer was looking forward to the winter with a certain feeling of security in the possession of a few good cattle and sufficient hay to feed them, when six head

DEMONSTRATION IN BUTTER-MAKING AT THE SHORT COURSE FOR SOLDIER SETTLERS' WIVES AT RED DEER, ALBERTA. SEVENTY WOMEN ATTENDED THIS DEMONSTRATION, WATCHING EVERY STEP IN THE MAKING OF GOOD BUTTER

died from eating poisonous weeds. But these things must be faced! The long winter passed somehow, and spring found Mrs. Stauffer still with her face to the future.

Money was required, however, for seed and to pay for further fencing and land clearing. The Board advanced \$200 more. Sixty acres were placed in crop this year and a good garden was planted. Then, while the crop grew day by day, additional land was cleared and broken. The prospects of an excellent harvest were bright, for the year 1920 was exceptionally favorable in the Peace River District. The wheat was turning nicely in the hazy days of early autumn and Mrs. Stauffer was looking forward to the time when the golden grain would be on its way to the markets of the world and its equivalent placed to her credit in the bank, when there arose one of those sudden storms which are the dread of every prairie dweller; and when it was over and the sun had burst forth again in all its former splendor nothing remained of that beautiful crop but a mass of tangled and broken stalks, half covered with hail.

It was a cruel blow. But Mrs. Stauffer was still undismayed. She concluded that her best plan would be to move in to Sexsmith for the winter, where she would be able to get work, leaving a reliable man in charge of the farm. Early the next spring, however, she was back on the farm superintending the seeding of seventy acres. This time fortune deigned to smile; and, according to the latest reports, Mrs. Stauffer was looked upon by the Soldiers' Settlement Board as one whose success was assured. But they have had to change her name on their office files, for she has

recently taken unto herself a husband; and in this new-found happiness we shall leave her.

Mrs. Stauffer's experiences have been given somewhat in detail, as they exhibit both extremes of fortune. Out of the twenty-six odd thousand soldier settlers who have been placed on the land through the agency of the Soldiers' Settlement Board it is possible to select a great many cases having particular interest; but in the majority of cases the story is one of hard work, careful management, and steady development. In a surprisingly small percentage of cases—about four per cent—have failures been recorded up to date. This is probably due to the careful manner in which the applicants have been selected.

The applicant for a loan under the Soldiers' Settlement Act must be able to show a good record as regards character, must have had farming experience, and must otherwise satisfy a board composed of responsible persons in his own neighborhood that he or she has a reasonable chance of making a success on the land. The applicant must also make an initial payment equivalent to ten per cent of the value of the property to be bought. Loans are granted up to a maximum of \$7,500, which includes a maximum of \$4,500 for the purchase of land; \$2,000 for live stock, implements, and other equipment; and \$1,000 for buildings and permanent improvements. Loans for the purchase of land are repayable in twenty-five annual installments, amortized with interest at 5 per cent. Stock and equipment loans are payable in six annual installments, amortized at the same rate. Interest is not charged, however, and installments of principal and interest do not become

WILLIAM JOHN, SON OF SERGT. A. LAGIMODIERE (GREAT-GREAT-GRANDSON OF THE FIRST WHITE WOMAN IN WESTERN CANADA) AMONG THE BIG PUMPKINS ON DADDY'S FARM NEAR LORETTE

HERE ARE TWO SOLDIER SETTLERS BUILDING THEIR PRAIRIE HOME IN MANITOBA. NOTE THAT THE HOUSE IS BEING OCCUPIED BY THE HOME-MAKERS WHILE STILL UNDER CONSTRUCTION

due until the settler has had an opportunity of producing a crop. In cases where crop failures occur, or where for other reasons beyond the settler's control he fails to meet his payments, the arrears are reamortized.

Many soldiers have preferred to engage in mixed farming rather than incur the risks which the prairie grain-grower has to encounter. One of these is John Hare, of Belmont, Colchester County, Nova Scotia, who secured 175 acres of improved land in October, 1919. His loans total \$4,700. The first year he marketed the following: Potatoes, \$625; oats, \$375; roots, \$120; hay, \$875; garden crops, \$525; while \$360 was received from the sale of butter. These items are all such as require a considerable amount of work, and the experience of the Board goes to prove that the settler who possesses the inclination to work very rarely fails.

Here is another instance of mixed farming: John A. Brown bought a farm of 55 acres in the Hemingford District, Quebec, in April, 1919. His receipts for the first year were: Maple sugar, \$200; hay, \$360; potatoes, \$50; apples, \$75; sale of stock, \$100; oats, \$175; and \$800 from milk. This was also improved land in an old settled community.

A. Lagimodiere, of Lorette, Manitoba, likewise bought improved land. In spite of partial incapacitation by reason of wounds, the Board decided that he was a good risk, and in August, 1919, advanced him funds for the purchase of 240 acres of excellent Manitoba land. His total advances to cover land, equipment, and improvements amounted to \$7,030, but he was able to earn \$3,890 the first year, even though much of his work was necessarily unproductive.

Charles Hemeyer emigrated to Alberta from the United States a few years before the outbreak of the war, served in France with the Twenty-seventh Battalion, C. E. F., and was demobilized in the spring of 1919. Later on in the same year the Government threw open a number of Indian Reserves for pur-

chase by returned soldiers, among them the Bob Tail Reserve, near Ponoka, Alberta. The Bob Tail Reserve was subdivided into thirty-two homesteads. Situated as it was in the midst of a prosperous and well-settled locality, this land was eagerly sought and the number of applicants was many times greater than the supply of homesteads. As one way out of the dilemma, the Soldiers' Settlement Board decided to offer the farm sites by lot. Among the fortunate applicants was Charles Hemeyer. He secured additional loans with which to provide the necessary live stock, implements, and permanent improvements, and in the interval has developed his holdings into a very valuable farm. He is unmarried and only thirty-five years of age; therefore it is not anticipated that his position of splendid isolation will long continue.

Not all the farmers in the prairie provinces are confirmed grain-growers. J. W. Hosford is a case in point. After being demobilized at the end of his two and a half years' service in the C. E. F., he decided to buy a farm near Edmonton, Alberta, and secured for the purpose a loan of \$6,000. He has specialized in dairying, and has now a fine herd of dairy cattle. His cows average among the highest in the province in milk production, one producing as much as 15,200 pounds of milk in 1920, while two cows alone returned him a profit of \$700. In that year his income from all sources was over \$3,000, including the following items: Milk, \$1,600; sale of hogs, \$330; wheat, \$760; and \$384 from oats. Hosford is an Irishman, keen, intelligent, energetic, and has the assistance of a capable wife. He is of the type that makes good wherever you find it; but the Soldiers' Settlement Scheme has given him a start such as otherwise it would have been hard for him to attain.

Literally, thousands of similar cases from every part of the Dominion could be cited. These men have materially added to the total agricultural production of Canada, and, besides providing

homes for themselves and their families free from the attentions of the rent collector, many of them have been able to earn really attractive incomes.

After being placed in his future home the soldier is not turned adrift to face the uncertain lot of the farmer without further consideration. The local supervisor makes periodical calls on him and is ever ready with advice and assistance when required. Perhaps of greatest aid to the settler is the department known as the Home Branch, whose function is to co-operate more particularly with the farm wives. Thousands of returned soldiers brought brides with them from overseas, the majority of whom were totally inexperienced in farm work. The Home Branch provides educational correspondence courses suited to the farm and household; it sends out regular bulletins dealing with timely subjects; and arranges at frequent intervals and at convenient centers free courses of lectures by experts on various phases of farm and household economics, supplemented by practical demonstrations.

The Soldiers' Settlement Scheme has probably not been sufficiently long in operation for its experience to date to be taken as a fair indication of the future. The present period of depression, in which the prices for all kinds of agricultural products have declined most tragically (from the standpoint of the farmer); is submitting the Scheme to a very severe test, and doubtless one or two seasons more will be necessary before any definite verdict can be reached. But the general impression among those best qualified to express an opinion on the subject is that it has fully succeeded in serving the ends for which it was created—to help towards re-establishing the soldier in civil life and at the same time stimulate the back-to-the-land movement.

One complaint that is somewhat general, and which seems to have a reasonable foundation, is that a large percentage of the lands bought under the

Soldiers' Settlement Scheme were purchased at a time when prices had about reached their highest, and, as a result, in a great many instances, the soldier settler's property now shows a very serious depreciation in value. Moreover, in each case the purchase price

was approved by the Board, and in most cases the soldier was entirely dependent upon the judgment of the Board and its agents, and therefore he feels that he should not be required to assume the whole loss.

At any rate, the demand is coming

insistently from the returned men's organizations that a revaluation be made, and it is possible that the Government will do something towards transferring to the shoulders of the taxpayer the burden which now rests upon the ex-service man.

THE CHILD, THE SCALES, AND THE TAPE-MEASURE

I—THE GREAT UNDER-WEIGHT ENLIGHTENMENT

BY MRS. ERNEST R. GRANT

DIRECTOR, CHILDREN'S HEALTH CRUSADE, WASHINGTON, D. C.

THE weight of a child is a practical index of his physical condition.

If he is habitually seven per cent or more under-weight for height, he is considered by many prominent pediatricians to be a child seriously in need of attention. When given a thorough examination, he will show marked signs of malnutrition. The symptoms most commonly recognized, depending upon the degree of malnutrition, are under-weight, poor color, dark circles beneath the eyes, protruding shoulder blades, flat chest, fatigue posture, flat feet, protruding abdomen, carious teeth, and naso-pharyngeal obstructions as indicated by mouth breathing, etc.

"Clinical experience has led us to the conclusion that children who are chronically seven per cent or more under-weight may be considered ill children," says Dr. David Mitchell, of the New York Bureau of Educational Experiments.

"Records based on a study of 22,000,000 school-children during 1918 showed twenty per cent of the American school-children are malnourished," says Dr. Thomas B. Wood, of Columbia University, Chairman of the Committee on Health Problems of the National Council of Education.

"Extended studies have shown conclusively that children seven per cent or more underweight for height require treatment," to quote Dr. William R. P. Emerson, Director of the Nutrition Clinics for Delicate Children, Boston, Massachusetts.

"As stated by Norsworthy and Whitney, 'Malnutrition affects height and weight of children, interferes with general development, delays puberty, lowers vitality, and makes the child susceptible to infections.' It is likely to precede tuberculosis, to produce rickets, and it retards mental development."

"Of the first thousand under-weight children examined at the Health Clinic at Montreal, Canada, a total of 6,404 defects were found, or an average of 6.4 defects per child," to quote H. R. Y. Reid, Director of the Canadian Patriotic Fund.

Referring to "The Great Under-Weight Delusion," in the March 15 issue of The Outlook, the article gives as illustration the hypothetical case of a "slender, wiry

boy" 12½ per cent under weight. The cause of under-weight is assigned solely to heredity. Because the "hypothetical boy" is "noisy and obstreperous" his hypothetical father considers him in good physical condition. To be noisy and obstreperous is apparently regarded as valid evidence of sound health, as no report is given of the result of a careful physical examination for detecting the underlying physical defects or faulty food and health habits which ordinarily produce under-weight in all but "hypothetical children."

The assertion is made that "whole races are typically slender, with weight below the general average." However, no statistics are given to prove this assertion nor to specify that such races are under-weight for height.

A study of the height and weight by various nationalities made in the Detroit public schools during 1921 gives the following information from the Detroit "Education Bulletin:"

For the purpose underlying this study was the securing of comprehensive data from which to develop standards of nutrition and growth for the children in the Detroit public schools. At the beginning of the second semester, January, 1921, the height, weight, age, grade, and nationality were secured for every child in the elementary grades. This data, together with the ratio of weight to height, were tabulated and analyzed. A division on the basis of nationality gave the following results:

TABLE 1—NATIONALITY AND NUMBER OF CHILDREN

	Boys.	Girls.
United States white.....	17,853	17,116
United States colored..	1,592	1,602
Anglo-Saxon	4,517	4,386
Teutonic	3,099	2,978
Latin	2,946	2,644
Slavic	4,499	4,223
Russian	3,300	3,272
Miscellaneous	5,671	4,691
Total	43,477	40,912
Grand total—84,389.		

The weight-height ratios were developed for boys and girls by dividing the weight by the height for each individual and finding the average ratio for each age-height group, which gave the following results for boys, which are

compared with the Emerson weight and height table for boys of nearest corresponding heights.

Detroit Height and Weight Tables ¹ for Boys.		Emerson Height and Weight Tables for Boys.	
Height.	Weight.	Height.	Weight.
42	41	41.7	41.2
43	44	43.2	43.8
44	45	43.9	45.2
45	48	45.3	48
46	50	46.5	50.3
47	53	47.9	52.8
48	54	48	53
49	56	49	55.4
50	58	50	59.6
51	61	51	62.5
52	64	52	65.8
53	71	53.6	70.7
54	74	54.5	73.8
55	78	55.8	78.2
56	82	56.8	82.1
57	85	57.5	84.8

For a comparison with this Detroit table the Emerson table is used because the standard requirements are the highest. The variations of the two tables, however, are comparatively insignificant when one considers that seven per cent below the average normal is the point of departure in classifying the under-weight child. This figure, then, would fall far below any of the standard requirements of any of the recognized weight and height tables now in use. To quote Dr. Joseph A. Murphy, Chief Medical Inspector of the Public Schools, Washington, D. C.: "It has been my experience that children who are seven per cent or more under-weight for height when given a thorough examination are found to be in poor physical condition. That they improve in health, strength, and vigor when their physical defects, health and food habits are corrected, and that this improvement is accompanied by increase in weight."

The article further states: "Folks with the weighing delusion" demonstrated that one-third of the children of a New Jersey town were under-weight and that the same condition existed in "private academies patronized by the well-to-do." While the writer character-

¹These tables apparently represent a composite average for many races, not for one separate race. Even if the separate figures were given for each class in Table I, an anthropologist would not recognize them as having any great bearing on the question of racial types. The classifications are much too loosely drawn.

—The Editors.

ized this as a "frightful delusion," he made no attempt to show that these under-weight children were not suffering from physical defects, faulty food or health habits, or some other reason needing correction; nor does he seem to take cognizance of the fact that the figures of this little New Jersey town curiously enough coincide with the percentage of the physically unfit as revealed by the draft statistics of 1918.

Another statement is that the "essence of the delusion" is that "there is only one normal healthy type of build . . . the worshipful average." Averages and measurements are very necessary factors in the scientific study of any problem. Individuals are measured mentally, and the rating obtained has much

significance when compared with the average. The temperature, pulse rate, blood pressure, respiratory rate, hæmoglobin percentage, blood count, basal metabolism, quantity and chemical composition of urine, and innumerable other measurements may be taken, all of which are of significance when compared with the average. If there occurs a variation from the accepted average, the cause is carefully studied and the significance of the variation from the average depends in each case upon the cause. The average is the basis for estimating the degree of variations from normal in all of these measurements. Therefore, in studying the health and nutrition of children variations from the average normal weight for height is an

important factor in the discovery of cases needing correction. For it is the consensus of opinion of all of these "deluded people" who are working with the under-weight children that a child seven per cent or more under-weight for height is in serious need of attention, and when given a thorough examination he will be found to have a much higher percentage of physical defects than children of an average normal weight for height, and, furthermore, when these under-weight children have had their physical defects corrected and are brought up to normal weight for height they are in much better physical condition, more alert mentally, and make much better progress in their school work.

II—MORE ENLIGHTENMENT WANTED

BY C. K. TAYLOR

MRS. GRANT, in her criticisms concerning my article on the "Under-Weight Delusion," has said so many things that are seriously true and so much that should be known to many who are careless concerning child welfare that it seems almost ungrateful to make any adverse comments at all, and yet one or two points must be touched upon, for the fact is that in depending so much upon mere weight comparisons many child welfare workers do not go nearly as far as they should. Noticing the weight of children was a first step. It has served a great purpose. It has drawn the attention of thousands of school folk and parents to many formerly unnoticed factors affecting the health of children. But it does not go nearly as far as it should, as we have said. It cannot be depended upon. It is not accurate.

First of all, when children more than seven per cent below average weight are treated for malnutrition, or some other ill, real or supposed (real in far too many cases), the fact is neglected that children within the limits of the average, or even children having weight

over the average, may also have malnutrition or some other ill. The writer has seen too many children in clinic and elsewhere not to have observed many cases of this kind. And so it is that by emphasizing attention to slender children almost exclusively we are neglecting the great mass of children who may be heavier—more heavily framed, for instance—and who in many cases need special care and diet just as much as do those who weigh less. For this reason alone we are right in demanding a medical examination for every school-child, whatever the weight, and a subsequent treatment of each child according to the findings of that medical examination. In brief, we utterly refuse to accept anything so unreliable as a weight comparison in lieu of a medical examination.

And this brings us to the term "under-weight" itself. What does it really mean? Well, many would have us believe that it means a certain percentage below the general average weight for the same age and height. Many physicians have agreed with the writer that this cannot be real under-

weight, for it does not allow for individual differences of build. We believe that under-weight exists when an individual is below the weight that individual should have, and that this cannot be told by comparing that individual's weight with general averages, but specifically and solely by a medical examination. When the medical examination shows that a child has malnutrition or other serious ill, one can well believe that the child's weight is below what it should be. And this is a very serious matter, needing all the fine care and attention the thousands of devoted child welfare workers and medical examiners can give.

The writer is the last one to deny the existence of real under-weight. It is frightfully prevalent. But the writer insists that it is not strictly confined to children who are below the general average in weight, and that therefore every child should be given a medical examination, and this and other similar ills be given proper care and treatment.

Now of course this brings us face to face with the central point of the whole argument. Those who pin their faith on

Courtesy of American Museum of Natural History, New York

SKELETON OF DRAUGHT HORSE

SKELETON OF RACE HORSE

Mr. Taylor wishes to know if the race horse suffered from malnutrition

the general average necessarily claim, as does Mrs. Grant, that there is but one normal healthy type of build—the general average type. I wonder if Mrs. Grant, or even Dr. Emerson himself, would carry the same idea to other creatures besides man. For instance, in the American Museum of Natural History, in New York, is the skeleton of a famous race horse, and near it one of a heavily boned dray horse. The bones of the race horse are slender and show the wiry strength of their possessor. Indeed, that race horse must have had a weight markedly below that of the thick-boned and clumsy dray horse. Yet can you imagine Dr. Emerson and Dr. Wood standing before the slight remains of that race horse, shaking their heads, and saying, sadly: "Alas, poor horse! He had malnutrition!" No, I can't imagine that at all. That horse represented a type of build handed down by heredity.

Levity aside—and, in fact, it is no matter for levity—the writer has examined far too many children not to be aware of the wide variation of normal types of build, from slender to stocky. The writer, however, does not pretend

to be an authority on anthropology, but a very considerable authority, Dr. R. Tait McKenzie, of the University of Pennsylvania, has confirmed the writer's findings. Now, if it is true—and it surely is—that the general average of all types of build is *not* the only healthy type, if it is true that there is a wide variation of normal types, ranging from slender to thickset, then most certainly the weight of a child cannot be used as a safe and sure indication of malnutrition or anything else, and we come back to the writer's main plea—that there should be a medical examination for every child, and that when children are found to be in good health then we can accept their weight as satisfactory, but see to it that there is a physical development proportional to the type of build. We have been concentrating on weight to the exclusion, almost, of physical development, and yet muscular development has a correlation with health and mental efficiency, if not character stamina.

Now, if you are going to consider all children whose weight is more than seven per cent below average as being malnourished, or the like, then of

course, as Mrs. Grant quotes from Dr. Wood, you will find millions of children coming under that category. If, however, there is a universal medical examination and this is relied upon for judgment as to malnutrition and other ills, then we will not find nearly so many slender children judged unhealthy, but we will find many more children of average weight and over who are equally in need of attention.

In a nutshell, then, the writer insists on going much further with such work than the Child Welfare Associations and medical examiners have gone thus far. The writer wishes for every child, whatever his weight, the same examination and attention now being given largely to slender children only. And, finally, the writer hopes that there will arise an interest in the physical development of children. If the devoted folk who are carrying on the fine work of the various movements toward child betterment would extend their care to children of all types of build, and then insist upon a first-class muscular development for each child, as well as good health, then their work, already of inestimable value, would become really magnificent.

THE GOSPEL ACCORDING TO CHINA

A STATEMENT OF THE MESSAGE OF CHRISTIANITY TO CHINA AS INTERPRETED BY CHINESE

THE UNITED CHURCH

WE Chinese Christians who represent the various leading denominations express our regret that we are divided by the denominationalism which comes from the West.

We are not unaware of the diverse gifts through the denominations that have been used by God for the enrichment of the Church.

Yet we recognize fully that denominationalism is based upon differences the historical significance of which, however real and vital to the missionaries from the West, are not shared by us Chinese. Therefore denominationalism, instead of being a source of inspiration, has been and is a source of confusion, bewilderment, and inefficiency.

We recognize also most vividly the crying need of the Christian salvation for China to-day, and we firmly believe that it is only the united Church that can save China, for our task is great and enough strength can only be attained through solid unity.

Therefore, in the name of the Lord, who prayed that all may be one, we appeal to all those who love the same Lord to follow his command and be united into one Church, catholic and indivisible, for the salvation of China.

We believe that there is an essential unity among all the Chinese Christians,

IN connection with the Chinese National Christian Conference at Shanghai, May 2 to 10, a number of commissions have prepared reports. Commission No. 3, on "Christianity's Message to China," is composed entirely of Chinese and represents the best thinking of the thoroughly trained Chinese Christians now living in China. There are two sections to the report of this Commission, one to be addressed to the native Christians and the other to the non-Christians. That to the native Christians was prepared by Professor T. T. Lew, Acting Dean of the Theological Seminary of Peking University, and Professor T. C. Chao, of Soochow, who has accepted a call to the same Seminary.

This report, which is here printed, in the English version prepared by Professors Lew and Chao, has the unanimous indorsement of the entire Commission for presentation at the Conference as herewith. An advance copy was brought to America by President J. Leighton Stuart, of Peking University, who has been attending the annual meetings of the University. The Commission regard this part of their report, it may be inferred from its concluding paragraph, as not only an address to Chinese Christians, but as also the basis of their address to Chinese not of the Christian faith.

and that we are voicing the sentiment of the whole Chinese Christian body in claiming that we have the desire and the possibility to effect a speedy realization of corporate unity, and in calling upon missionaries and representatives of the churches in the West, through self-sacrificial devotion to our Lord, to remove all the obstacles in order that Christ's prayer for unity may be fulfilled in China.

We confidently hope that the Church of China, thus united, will be able to remain an impetus to the speedy healing of the broken bodies of Christ in the West.

THE INDIGENOUS CHURCH

WE Chinese Christians do hereby acknowledge that the Church is the spiritual home of Christians where we receive a spiritual nurture which should not be alien to the racial inheritance and spiritual experience of our people.

We register our appreciation and gratitude for the devoted and self-sacrificial service of the missionaries who have helped to build up the Christian Church in China, and for the Churches in the West which have made the service of these missionaries possible.

But we wish to voice the sentiment of our people that the wholesale, uncritical acceptance of the traditions, forms, and

Miss Zee Rev. Peter Ching Professor T. C. Chao
Professor T. T. Lew Rev. Cheng Ching-yi Mr. Leung Siao-chin

MEMBERS OF THE COMMISSION ON THE MESSAGE OF CHRISTIANITY TO CHINA

organizations of the West and the slavish imitation of these are not conducive to the building of a permanent, genuine Christian Church in China.

We notice, moreover, that the Chinese Church is becoming conscious of her own unique mission and duty to-day.

The history of China, the characteristics of the people, the nature of the work, the results of our past experience, and the rapidly changing conditions of the country all demand an indigenous Church which will present an indigenous Christianity—a Christianity which does not sever its continuity with the historical Churches but at the same time takes cognizance of the spiritual inheritance of the Chinese race.

Therefore we appeal to all the followers of Jesus Christ in China, with united effort, through systematic giving, to reach the goal of self-support; through persistent practice, fearless of experiment and failures, to reach the goal of self-government; and through religious education, an adequately trained leadership, and devoted personal work to attain the goal of self-propagation.

We declare further that the time has come when Chinese Christians should make a careful study and with courageous experimentation find out what should be the forms and organizations and method that are the most practicable and helpful for the establishment of an indigenous Church.

We call upon the missionary leaders

of the Church to assist the Chinese in carrying out this great task by their useful advice and by giving unfettered freedom to the Chinese Christians in these experiments.

We confidently hope that the time will soon come when the Church of China will repay in part of that of which she has bountifully received from her mother Churches in the West, the loving tribute of the daughter—contributions in thought, life, and achievement for the enrichment of the Church Catholic.

THE DEEPER CONSECRATION OF THE CHURCH

WE recognize that the personal conduct of individual Christians and the behavior of the Church as a body is the living testimony to the Gospel of Christ.

We recognize that China is now passing through a critical stage of transition and in every walk of life there is a crying need of moral character.

We thank God for his creation of opportunities which have changed the indifferent attitude of the Chinese nation to Christianity to an attitude of close scrutiny. This demands an even more genuine Christian life on the part of every Christian and on the part of the Church as a body.

We confess with humiliation the failure of the Church to live up to the opportunity God has given her. The personal conduct of some Christians and

the life of the Church as a body have left much to be desired.

We recognize that the task of evangelization cannot be efficiently done without a genuine Christlike life.

Therefore we appeal to all those who call themselves Christians to rededicate and reconsecrate their lives and pray that the living power of the Holy Spirit may help us to glorify the name of Christ.

MORE DILIGENT STUDY OF THE WORD OF GOD

WE accept the Bible as the inspired Word of God and the supreme guide of faith and practice.

We do hereby express our appreciation of the patient, persistent, and diligent work of those servants of God who made the Bible known unto our people.

We are fully conscious of the fact that the Chinese Church as a Church is yearning for a Bible for the Chinese which is the work of the Chinese. Just as the English Bible is the work of English scholars and the German Bible is the result of the labor of German men of God, so the Chinese need a version of the Scriptures which is a product of the reverent scholarship of the Chinese race.

From the experience of our work and the rapid advancement of learning, and in view of the future task of the Church, we have come to the conclusion that we must have an indigenous version of the Holy Scriptures, just as we need an indigenous Church.

We therefore call upon all Christians in China to study more diligently the Word of God, first of all individually in an ever-increasing devotion for one's own spiritual life, for comfort, for hope, for faith, and to gain strength for Christian service.

And, secondly, we call upon the students in schools and colleges to see the glory of Biblical scholarship and to offer their lives to its thorough study, preparing themselves by the grace of God to be adequate interpreters and expositors of the Word of God in our noble Chinese tongue, so that the people of China shall share in full measure with the people of the West the splendor and joy of the truth.

We believe that, since the Bible is the Word of God, the truth of God fears no test. It can stand any investigation of a reverent heart. We wish to make known that we fear no application of any genuine scientific method to the study of the Holy Scriptures.

But we wish to make it clear that the study of the Holy Scriptures should not merely be for its literary or intellectual interest, but should mainly and primarily be for the guidance of actual living. We as a Church hereby renew the pledge to follow the light of Holy Scriptures in our social and national living.

We hereby lay emphasis upon the value of the *whole* Bible and call upon all Christians in their religious educa-

tion in the home, in schools and colleges, in the Church and its seminaries, to make the Bible and the *whole* Bible central in their teaching.

We firmly believe that the Bible is God's message to every individual, irrespective of educational attainments. So it is our aim that the Holy Scriptures should be read by every citizen of the Republic. The high percentage of illiteracy among our people should be faithfully dealt with by the united effort of the whole Church in order to hasten the day when the Holy Scriptures can be opened up to all who have eyes to read.

SOCIAL REGENERATION

WE take this occasion to state in most emphatic terms our realization of the tragic reality of sin, its hideousness, and its all pervasiveness and to testify to the saving grace of Jesus Christ, through whose death we are reconciled to the holy and righteous God.

We also believe that sin is fundamentally an individual problem, but it is also social. We believe that an unjust economic order, an unrighteous political régime, unfair treatment of any human being or of any group, is unacceptable to the righteous and loving God.

We take this occasion to express our appreciation of the various forms of social service which have been rendered to our people through the earnest efforts of the servants of God and sustained by the generous support of the faithful in the West.

We confess our failure to meet adequately the social needs of the Chinese people thus far.

We are further conscious of the ever-increasing and crying need of the social regeneration in China to-day. We recognize that a thoroughgoing application of Christian social teachings is of primary importance.

We hereby call upon the whole Church to proclaim the justice as well as the love of God, and to apply Christ's teaching of justice as well as that of love in our social life.

We hereby call upon the Church to mobilize all her forces to work for the regeneration of the home, of economic conditions, of political standards, of educational, industrial, and commercial life, in thought and in practice, through the spiritualizing power of Christ, and to accomplish it at any cost and at whatever sacrifice the Church may suffer, so that we may hasten the speedy coming of God's kingdom and the full realization of His will on earth as it is in heaven.

INTERNATIONAL BROTHERHOOD

WE of the Chinese Church believe that God has made of one blood all nations that may dwell on the face of the earth and that he is no respecter of persons or of nations, but the loving Father of all.

We express our appreciation of the

manifestation of international brotherhood through the missionary effort of the last century in China, but we at the same time express our deepest regret for the unfortunate circumstances through which Christian work has been introduced into China and that the history of the Church of China has been darkened by the association with the repeated incidents of national humiliation which have been one of the greatest obstacles to the speedy evangelization of our race.

We, as a Church, confess her failure to stay the hands of the so-called Christian governments of the West in their unchristian exploitation and aggression upon the sovereignty of China.

We firmly believe that the teaching and the life of Christ have taught us beyond any doubt the possibility and the necessity of international world brotherhood. With Him nothing is impossible.

We hereby call upon every one who serves in the Christian Church in China to seize every opportunity of promoting national friendship and to fight together against any international injustice.

We further believe that the starting-point for genuine internationalism is afforded by the providence of God within the Church of China, in the development of which different nations have heretofore had a share.

We express our appreciation of the good examples of international comity and co-operation among the missionaries of different nationalities, and especially to the increasing effort for union work in educational and medical service. We confess at the same time that the relationship between foreign missionaries and the Christian workers, partly due to almost unavoidable circumstances, and partly due to human weakness, has left much to be desired. We are voicing the sentiment of the loyal and devoted servants of the Church in all parts of China to ask for a more vigorous effort on the part of missionaries to improve the conditions, to emphasize Chinese leadership, to sacrifice individual preferences and such national and racial prejudices as have in many instances retarded the speedy formation of an indigenous Church in China. We also call upon Chinese Christian workers to study the problem of co-operation and to be persistent and patient as to their faith in its practicability, for only through co-operation can the great task of the evangelization of China be accomplished.

We as a Church believe that God has a special mission for each nation on this earth, that each nation has a definite contribution to make to the progress and enrichment of humanity; that China, which has been preserved by him throughout these ages as an independent and sovereign nation, has her distinct destiny and contribution to make to the world; that in the present world conflict and restlessness and under the yoke of accumulated national humiliation, we Chinese Christians feel as one with our fellow-citizens that we must turn to

somewhere for genuine love as the only solution for the present international situation. Therefore we call upon the whole Church to exert her influence to demand from time to time adequate hearings from the nations of the world for our claim to the inalienable right of our nation to her sovereignty and to her unfettered opportunity for development and growth, and that the Church should work with untiring zeal through some definite programme to promote such international service as will attain the end we seek.

Furthermore, we call upon all Chinese Christian pastors and other teachers to Christianize the rapidly developing national consciousness, that we as a nation may be a witness to the whole world of the wonderful gift of the peace-loving nature with which God has endowed our race.

EVANGELISM

WE, the Chinese Church, declare that we have the commission from the Head of the Church, Jesus Christ, to proclaim the Gospel to every creature.

We express our appreciation for the work of the missionaries who through untold difficulties have blazed the way and laid down the foundation of a great structure for national evangelization and for the Christian Churches in the West through whose faithful support the missionary work has been developed and attained its present growth.

We confess with humiliation that we Chinese Christians have fallen short in thoroughgoing efforts to carry on the noble task which is ours.

In view of the small percentage of Christians in proportion to the population, the vast extent of territory where darkness still prevails, and the lack of indigenous and vigorous presentation of the Gospel to the various classes of society, we sense the appalling need of a thoroughgoing evangelism.

We hereby call upon all the followers of Jesus Christ to go forth with renewed zeal and consecrated hearts, with persistent efforts, and through united and definite programmes, to evangelize every part of China.

We hereby declare that in our evangelistic efforts we stand solidly on the evangelical faith of the Christian Church, the faith which has given us our genuine religious experience and which has led us into intimate relationship with God our Father through Jesus Christ our Lord. We also emphasize that the evangelical faith which we proclaim is also the faith of an abundant life which actually manifests God's love as revealed through Jesus Christ and which is being continually revealed and witnessed in our hearts by the Holy Spirit.

We take this opportunity to state our religious experience in our own tongue and in our own way as a summons to this evangelical faith from the Chinese Church to its non-Christian fellow-citizens.

A NEW YORK BANKER FINDS RELAXATION UNSUSPECTING

IN fiction the life of the big business man is generally presented as a procession of dollar marks and decimal points. But occasionally the fiction writer has something to learn from life. The artistic impulse is too strong to be smothered by Wall Street. These anonymous sketches of New York commuters were drawn by one of the very busy men of that much berated thoroughfare. He has made hundreds of such sketches on his journeys to and from his home. His evening paper becomes an unnoticed sketch book, and his fellow travelers rarely detect this bit of droll diversion. The girls knitting or the men reading their papers, or even a twosome in a rear seat, may be hurriedly jotted down as the train rushes its load of Manhattan's suburbanites back to their flower-gardens, tree-frogs, and servant problems.

The shrewd, benevolent features of this veteran commuter were drawn on Ted Meredith's story, but neither Ted nor the commuter knew anything about it

Professor? Floor-walker? Who knows? We suspect that this gentleman has a painful amount of certainty concerning the accuracy of his own opinions. But the reader is free to suspect anything he pleases

Possibly a trial lawyer, ruminating on how to save his man from Sing Sing. Or possibly he is merely pondering upon an underdone chop. Thoughts on food and philosophy frequently produce the same outward manifestation

A typical example of the substantial, established citizens who sit on boards of directors and live in suburban Tudor mansions. He has the austere dignity of one who is quite sure that he has arrived

IN SKETCHING SURREPTITIOUSLY THE COMMUTERS

This gentleman's jaw suggests that he might have raised a violent objection had he known that he was the subject of this sketch

Nowadays it isn't always safe to jump to conclusions concerning the thoughts behind such a face as this. Would you, for instance, if you were about to engage this lady in conversation ask her opinion of Bernard Shaw or of Harold Bell Wright?

Sometimes commuters, as the story has it, sit and think. Sometimes they just sit. We think this one is just sittin'. Perhaps she is part of the stream which fluctuates between intelligence offices and suburban homes. Her days, we fear, are not long on any particular piece of land

He ought to make a friendly seat-mate, though we suspect that he might be a bit close in a business deal. But, never having taken a correspondent's course in the school which professes to measure a man's soul by the length of his nose, we are not at all dogmatic when it comes to character analysis

THE BOOK TABLE

A GROUP OF SOME NOVELISTS

THERE is little in the fiction of the last few weeks that is of the large and lasting kind, with one notable exception—Mr. Galsworthy's "The Forsyte Saga,"¹ which is only new in its collective form. This is a *magnum opus* in both senses, physical magnitude and breadth of artistic achievement. It includes three of the author's best-known and best novels, "The Man of Property," "In Chancery," and "To Let," and, linking them together, two new and charming short stories, "The Indian Summer of a Forsyte" and "Awakening."

Whatever may have been Mr. Galsworthy's intention when he wrote the first one of these stories, they do in their present connected form present the good and bad, wise and foolish, romantic and stolid aspects of one English family's life and doings for three generations. One smiles at the genealogical chart, yet only wishes he had had it when reading "In Chancery" and "To Let." Once fairly entered upon, this "saga" is constantly more and more engrossing. That is because it deals with fundamental things—the longings, passions, aversions, foibles, fatal misconceptions of men and women. Two comments, one from an English, the other from an American critic, tell the secret of the book's importance: The English writer calls it "A study of English middle-class life which will live, because he has made it to live, and by general verdict it is a masterpiece of ironic insight, great-heartedness, and an austere style." The American writer, Mr. Carl Van Doren, says: "It is beautiful literature; it absorbs the troubled lives of men into the serenity of art."

But I started to speak of strictly new novels. One thing rather noticeable this

¹The Forsyte Saga. By John Galsworthy. Charles Scribner's Sons, New York. \$2.50.

MARY JOHNSTON

spring has been the sincere, thorough work of some novelists. I have already spoken of "Maria Chapdelaine," a true bit of setting and drama without sensationalism or blowing of horns to attract the crowd. Equally entitled to that praise is Selma Lagerlöf's new story, "The Outcast."²

Miss Lagerlöf is the only woman who ever received the Nobel Prize for literature. She is as much beloved by Scandinavian readers as was Hans Christian Andersen, from whom in the literary character of most of her work she differs as far as is conceivable. Why should a writer be so popular when her stories are not stirring, thrilling, or humorous? It is because Miss Lagerlöf has a sensitive imagination, a delicate perception of her environment, a deep sympathy with the struggle and tragedy and mutual helpfulness of common life. When she wrote of Swedish life for Swedes, she touched their hearts and won their praise. But the more she understood Swedish life, the more she understood life everywhere, and that is why she is so widely read in English translation. When, long ago, she was asked to write a "reader" for public schools, she wrote "The Wonderful Adventure of Nils," one of her best stories—full of talk about animals, plants, play, and old customs. One critic said of it: "This book was not patched together by a dilettante or by a committee. It was written by a highly gifted, warm-hearted seer, to whom the nature of children is not a murky pool in which to fish at random, but a clear, reflecting mirror." Not long after the publication of "The Wonderful Adventures of Nils" an orphan boy who bore the name of the hero wrote to the author and told her of the desolate little world in which he lived, whereupon the novelist sought him out and adopted him.

"The Outcast" has a theme that is horrible, yet is treated so tenderly as not to seem ghoulish. A sailor, returning to his village, is believed to have been guilty of cannibalism when shipwrecked; he is not even certain of his own innocence, for he was delirious under starvation. But this outcast finds relief from the loathing heaped on him through humble services to the poor, the ill, the unhappy. Long his help is rejected; even the children turn their backs on the schoolhouse he builds with his own hands; his own parents will not take his money. The war breaks out and, mystically, its horror swallows up lesser horrors. The story is essentially a plea for peace through sacrifice. When the time comes that removes Swen's imaginary stigma, he has become the savior and helper of his village. The story is infinitely touching; its art value lies in the author's restraint from

²The Outcast. By Selma Lagerlöf. Translated by W. Worsster, M.A. Doubleday, Page & Co., New York. \$1.90.

stressing the agony of this situation; instead, she always softens it with the sweetness of Swen's Christlike devotion and patience.

Miss Johnston's "Silver Cross"³ is a sixteenth-century tale of friary against abbey, of miracle workers rivaling fakers in fraud, of a credulous and fickle populace, of the true love of a light-of-love, of jealousy and hatred among the great and holy, and of devotion to honor and truth in one who is sinful and despised. The author's method of bringing out the mediæval setting and pageantry of her romance is peculiar but effective; the diction is so odd that one begins by wondering whether the author has invented it and ends by guessing that she may have studied the common speech of the epoch closer than those who have built up a conventional and artificial sixteenth-century parlance for literary use. The narrative is abrupt, but purposely so; the movement is rapid, sometimes elliptical, but always fervid and vital. It reminds one of Maurice Hewlett's "Richard Yea and Nay" and other pseudo-antique romances. It will not appeal to so large an audience as Miss Johnston's "Prisoners of Hope," but it will be recognized by a choice class of readers and critics as a delicately wrought tale with a passion of soul showing itself beneath the curt sentences.

It is a far cry from mediæval romance to modern realism. Mrs. Watts deals, here as always, with people as they are, and does so pleasantly, fairly, with kindly humor, with admiration for sincerity and contempt for those who temporize with false standards. The main theme in "The House of Rimmon"⁴ is the temptation of a young literary genius, Cleve, originally a dishwasher,

Cleveland's New School Buildings

TO house its army of 122,000 public school pupils, the City of Cleveland has provided many splendid new buildings. Architecturally, they are masterpieces—models of convenience, comfort, safety. And in line with standard practice the country over, most of these schools are covered with Barrett Specification Bonded Roofs.

One reason for the popularity of these roofs is, of course, their unequalled economy—moderate cost, long service, and no upkeep. But another reason, and a very important one, is their high fire-resisting qualities.

When burning brands fall on the slag or gravel surface of a Barrett Specification Roof, they burn themselves out without doing serious damage. If a fire inside the building weakens the roof-deck, the Barrett Specification Roof has the necessary tensile

strength to support itself over a large area, thus effectively blanketing the fire.

The degree of fire protection afforded by a roof is not determined by the character of any one ingredient of the roofing material, but by the ability of the completed roof to resist fires that attack it, whether from the inside or the outside of the building. Barrett Specification Roofs are given base rating by the National Board of Fire Underwriters.

There are two types of Barrett Specification Bonded Roofs—Type "AA" bonded for 20 years; and Type "A" for 10 years.

Before specifying or closing contract for a Barrett Specification Bonded Roof, be sure to read carefully all the stipulations in the Specification.

Full details regarding these Bonded Roofs and copies of The Barrett Specifications sent free on request

SELMA LAGERLÖF

to prove false to his ideals of art and to make his plays meretricious, cheap, and vulgar in order to get them on the stage. He yields, "follows after false gods," or, as the title suggests, in Scripture phrase, enters into "The House of Rimmon." His wife, a pathetic little ignoramus, is matched against a fascinating woman of culture. There are agreeable pictures of New York literary and dramatic circles and two or three possible suggestions of real personages. Many readers will be pleased to take the excursion to Bermuda in such pleasant company. The novel is thoroughly readable, but it is something more than entertaining, for it makes a fine protest against vulgar and sensual incursions into drama and fiction.

Notable among other quite recent novels by women that have something to lift them above ephemeral fiction is Mrs. E. M. Delafield's "Humbug,"² which is remarkably searching and vigorous in driving home its point—the mischief done by parents and teachers who fail to look facts in the face, who dodge responsibility, and let supersensitiveness and sentimentality rule them. I should be decidedly surprised, judging from past performances, if also in this same category does not belong Anne Douglas Sedgwick's "Adrienne Toner" (Houghton Mifflin Company), which reaches me just as this is written.

R. D. TOWNSEND.

THE NEW BOOKS

BIOGRAPHY

MANON PHILIPON ROLAND (Early Years). By Evangeline Wilbour Blasfield. Illustrated. Charles Scribner's Sons, New York. \$3.50.

This is the first volume of what was intended to be a two-volume life of "the true heroine of the French Revolution." The author died before she was able to complete her work; her son tells us that "she left a large quantity of notes but they are mainly memoranda and useless without her own interpretation and elaboration." This first volume is admirably written. It is evident that Mrs. Blasfield was familiar with her subject, that she wrote *con amore*, that to her familiarity she added very careful study, and she has produced a wholly admirable picture of Madame Roland's early life and an artistic portrait of her character. But the most important part of the life is of course left untouched, and the volume will be valuable chiefly to students of the French Revolution who from other sources have some information.

as we sincerely hope may be the case, some one may be found able to complete the work so well begun.

ELIZABETH CADY STANTON. By Theodore Stanton and Harriot Stanton Blatch. Illustrated. 2 vols. Harper & Brothers, New York. \$6.

The forceful and eloquent pioneer of the woman's rights movement in this country is interestingly revealed in this work through her written reminiscences, her letters, and her diary. The story of the movement of which she was an acknowledged champion, at first discredited and at last triumphant, is a stirring one, full of incident, personal detail, and outspoken characterizations of her contemporaries. Mrs. Stanton was a woman of abounding vitality, physical and intellectual, and these volumes are permeated with her virile spirit. The work unaccountably lacks an index, but is otherwise highly creditable to the editors, Mrs. Stanton's children, Theodore Stanton and Harriot Stanton Blatch.

THE INSCRUTABLE FUTURE

BY THEODORE H. PRICE

EDITOR "COMMERCE AND FINANCE"

THE credence given to what is printed and the omniscience attributed to writers and editors are amazing.

Because I happen to own and edit a weekly newspaper called "Commerce and Finance," and contribute an occasional article to some other publications, I receive a great many letters from all over the world which seem to presuppose that I

know everything and can foretell the future months and years ahead.

Now of course every one who knows an editor realizes that he is an extremely ignorant person trading largely on a small intellectual capital. His success in seeming well informed is chiefly due to the books of reference with which he is provided,

Financing Our Greatest Export Commodity

COTTON is this country's largest export commodity. In 1921 the value of cotton shipped abroad amounted to more than 12 per cent. of all foreign sales.

This Company plays an important part in financing the cotton crop. At three great European ports of entry for cotton—Liverpool, Havre, and Antwerp—this Company maintains its own branch offices. These offices specialize in cotton financing. With the technical knowledge, ex-

perience, and facilities essential to proper handling of the business, they render an unusual service to the exporter.

In addition, the services of our branches in London, Paris, Brussels, and Constantinople are available to both shipper and buyer in the furtherance of their business.

We invite you to state the problems of your foreign business, so that we may explain how we can serve your particular requirements.

Guaranty Trust Company of New York

NEW YORK LONDON PARIS BRUSSELS LIVERPOOL HAVRE ANTWERP CONSTANTINOPLE

his ability to restate platitudes as if they were novelties, and his willingness to appropriate the ideas of others.

Of the future he is just as ignorant as every one else, for

Heaven from all creatures hides the book of fate,
All but the page prescribed, the present state.

Were it otherwise, life would be unendurable. Some one has said that "we live under a sentence of death with an indefinite reprieve," and if we knew what would be our condition to-morrow or a year hence we would be utterly miserable.

Our misery would probably be increased if we had the power to arrange the future as we saw fit, for we would be forever rearranging it, and those affected by our change of plans would curse us bitterly.

Those who write letters to editors must realize this, and yet there are thousands of people who not only attach importance to prophecies of the future but are willing to pay large fees to financial soothsayers (note the word) who claim a "soothing" gift of scientific foresight. This claim they often try to vindicate by elaborate historical studies and charts or diagrams which it is the present fashion to call "graphs."

Some of these self-constituted seers have really deceived themselves, for of all the fallacies by which men are deluded the greatest is probably the one that is expressed in the statement that "history repeats itself."

History cannot repeat itself, for it is a kaleidoscope in which the bits of colored glass that make up human experience are never identically arranged, and it is manifestly illogical to assume that present conditions will produce the effect formerly caused by those which were different.

To argue, for instance, that certain financial conditions will now have the same result that they produced before the Federal Reserve Banks were established is manifestly absurd; but gallons of ink have been wasted and hundreds of "graphs" have been prepared in an effort to support such conclusions.

There is not the remotest analogy between the fiscal condition in which the more important governments find themselves to-day and their pre-war position, but many people are nevertheless busy studying the financial history of Napoleon's time in an effort to determine what may now be expected. That such studies are fascinating is admitted, for it is easy to generalize with regard to human nature and to deduce half-truths that seem to be new discoveries from our generalizations. But hundreds of philosophers and thousands of speculators (who are, in a sense, would-be philosophers) have been wrecked upon the rock of a half-truth, and the Latin phrase *post hoc propter hoc* describes a seemingly truthful fallacy that is responsible for the errors of many scientists, the mistakes of many physicians, and the bankruptcies of many merchants.

If from the numerous letters that have

The Strength of AMERICA Reflected in Washington

TO Washington, the Nation's Capital, flows a steady stream of visitors from all the States in the Union. They come to see the Government buildings, the national memorials and the many points of historical and patriotic interest.

They return home impressed and inspired, not only by the magnificence of what they have seen, but also by the manner in which the Capital City reflects the strength and permanence of America, and of its institutions and ideals.

Where else, if not in Washington, would you expect real estate values to be sound and First Mortgage Investments to be safe?

The name of The F. H. Smith Company has been linked with First Mortgage Investments in Washington since 1873. We have sold our offerings to conservative investors throughout the country on our record of *no loss to any investor in 49 years*.

Inquire today about our 7% Safeguarded First Mortgage Investments, strongly secured by improved, income-producing business property in the heart of Washington.

You can invest in denominations of \$100, \$500 or \$1,000, for as short a period as two years or as long as ten years, either outright or under our 7% Investment Savings Plan.

FINANCIAL DEPARTMENT

(Continued)

come to me recently I may construct a cross-section of the public mind, I should say that men are especially curious now—

First, As to the future of the American stock market.

Second, As to the probability of a general business revival in the United States.

Third, As to whether the foreign trade that we enjoyed during the war and until recently is permanently lost to us.

Fourth, As to whether the foreign securities now being offered in the United States will be permanently safe investments for American capital; and

Fifth, last, and generally, As to whether the revival of speculative activity now discernible presages the return of an enduring prosperity. The questions asked are generally more specific, but most of them will fit in one of these categories.

I have grouped them accordingly that I may reply to them, but there is a difference between an answer and a reply, and I shall not stultify myself by attempting the former.

First, As to the stock market, I will reply, as always, by pointing out that there are in the United States over 320,000 private corporations and thousands of political communities, States, cities, counties, school districts, road districts, irrigation districts, etc., all of which issue stocks or bonds or both. To express an opinion that is worth anything about any one of these securities or any particular group or class of stocks and bonds presupposes a special study that can be expected only of a specialist, and to him those who seek reliable information in regard to intrinsic values should repair. No one can say whether the stock market as a whole is going up or down. As a rule, it reflects the condition of the money market and the psychological state of the public mind. Money is generally cheap when and because business is dull and people are depressed.

If it is ever safe to buy the speculative counters that go up and down on the Stock Exchange, that is the time, for when interest rates are low stocks can be carried cheaply, and because hope springs eternal in the human breast elation has never yet failed to follow depression. There are, however, but very few who can detach themselves from the crowd or resist its psychological contagion.

This is why most speculators go broke or quit losers. It is emotionally impossible for them to buy when most people are selling or sell when the crowd is buying.

The exceptional superman can do this, but the average man will be better off and happier if he confines himself to the investments which an honest and experienced banker recommends. Both he and the banker will make mistakes, but they won't be ruinous.

Second, As to a general business revival, all that can be said is that we

have 110,000,000 people in the United States, but few of whom are working at anything like capacity. Most of them can produce more, and thereby increase their purchasing power. Business means the distribution of goods, and it is increased by an enlargement of production at low prices rather than by reduced production at high prices. The continuous introduction of labor-saving machinery to some extent offsets the present unwillingness of most Americans to work up to capacity, but, while the volume of money changing hands may be increased by advancing prices, the volume of goods produced and consumed—or business—will be increased only by harder work. A real revival of business is not, therefore, to be expected unless men become willing to work harder. Many are loafing now because by working part of the time they can make enough to live all the time, and a reduction in wages would seem to be the only cure for the present laziness and frivolity.

Third. As to our foreign trade, the indications are that we shall lose much of it. In a previous article I have already pointed out that we could prosper if we had no foreign trade at all, and, while we may suffer temporary distress in adjusting ourselves to a self-imposed commercial isolation, the probability is that the adjustment will be necessary.

Commerce is an exchange of goods for money, credit, or other goods. Europe has no money to pay us for what we have to sell.

We grant her credit grudgingly and are preparing to insist upon the repayment of the loans made to the Allied Governments during the war.

Our foreign commerce, therefore, depends upon our ability to exchange goods for goods, and this is seemingly to be made almost impossible by the erection of a tariff wall so high that it will exclude most European products.

It is a great adventure in protection, but it remains to be seen whether it will not destroy more than it will protect.

Fourth. As to the permanent value and ultimate repayment of the foreign obligations now being offered to American investors I am confused. There is no precedent upon which to base an opinion. In an address I delivered recently I said that we were in the "fourth dimension" of credit. The mathematicians can prove that matter has a fourth or "nth" dimension in addition to the three admitted and comprehensible dimensions of length, breadth, and height. But neither they nor any one else can as yet visualize this fourth dimension as a concrete thing. So it is with the outstanding public debt and paper money of the world's various governments.

They reach a total that is utterly beyond human comprehension. Certainly they cannot be paid off during the present generation. Whether they will ever be paid is a question which cannot be answered without considering the possibility of war in the future and the ability of the debtor governments to collect taxes far higher than have ever previously been borne.

FINANCIAL DEPARTMENT

(Continued)

sold would seem to be good, measured by pre-war standards of a safe relation between national debts and national wealth, but it is impossible to say whether they would continue to be good if the oppressed taxpayers of the more heavily burdened nations should organize a general strike against excessive taxation. The question is beyond my ken, and it is to be doubted whether the most prescient statesmen or the most profound students of history can answer it definitely and finally.

Fifth and Last. As to the return of an enduring prosperity, I can only reply as I did to the third group of questions. Real prosperity is the result of increased production and consumption at low prices. No two authorities have as yet agreed upon a definition of inflation.

I submit that "it is the extravagant expenditure of easily borrowed capital," and I think that the revival of speculation now discernible is due to what might be called an artificially produced abundance of credit rather than to an increase of the real wealth, which consists of the things that are created by agricultural and industrial labor.

In respect of many things our agricultural and industrial production is now smaller than it was before the war, but we have a credit system that is peddled on a gold reserve and we have attracted thither nearly half the world's gold supply. The result is that we have now an abundance of credit. It is therefore easy for us to borrow, and we are spending extravagantly. These are conditions which inflame speculation, but they do not increase wealth, and it is to be doubted whether we are much better off than we were before the war in so far as productive property and consumable things are concerned.

For this reason it is questionable whether the revival of speculation presages the enduring prosperity that is, and always will be, the result of work and cannot be secured in any other way.

If America is to be really prosperous and happy, we must work harder, take fewer holidays, and play less.

Nearly every salaried wage-earner in this country now expects at least two weeks' vacation with pay. In most States there are twelve legal holidays. Saturday is generally a half-holiday, upon which not more than four hours' work is done.

The eight-hour day is general, and the result is that there are but few who work more than forty-four hours a week for forty-eight weeks a year. This is 2,112 hours.

A recent Census bulletin reports that there are 41,609,192 persons gainfully employed in the United States.

There are 8,760 hours in a year of 365 days, and these figures mean that we are trying to subsist and be prosperous upon the labor of 40 per cent of the population working 24 per cent of the time. Is it possible? If not, the only remedy is more work. This is platitudinous, but, as I pointed out, the platitudinous is an editor's chief reliance.

TO SUMMER RESORT PROPRIETORS

The Outlook will devote a special section in its spring and early summer issues to advertising of summer resorts, tours and travel. This will appear every week during May, June, and July. The issue of May 24 will be the Annual Out-of-Doors Number containing articles on vacation subjects and illustrations especially selected. The corresponding issue of 1921 carried 198 advertisements of hotels and resorts.

Write us early and we will be glad to give you copy suggestions

SCOTLAND'S GRANDEST TOURS—

Wonderful Fiords Nearer than Norway

1. GLASGOW TO OBAN by magnificent swift Saloon Steamer "Columba," viewing the Shipbuilding on the Clyde, passing Dunbarton Castle, and calling en route at the beautiful Clyde watering places of Dunoon and Rothesay, thence by the famous Kyles of Bute, Crinan Canal and Firth of Lorn.

2. OBAN TO STAFFA AND IONA is the grandest One-day Tour in the British Isles, visiting Fingal's Cave in the Isle of Staffa, St. Columba's Sacred Isle of Iona, with its ancient Cathedral, and the burying place of the Scottish Kings, and passing the ancient Castles of Dunollie, Dunart, Ardornish, Aros, Mingarry, and Gylar, also Tobermore Bay, where lies the Arnaid species ship.

3. OBAN TO INVERNESS via beautiful Loch Linde and Loch Eil, passing the scenes of the adventures of Alan Breck, the hero of Robert Louis Stevenson's famous novel "Kidnapped," viewing Glencoe, the scene of the great massacre, and calling at the ancient little town of Fort William, sheltering pleasantly at the foot of Ben Nevis, Britain's highest mountain, through the famous Caledonian Canal, Loch Oich and Lochness, the land of Prince Charlie and his loyal clansmen.

If these tours are not in your itinerary, your visit to Europe is wasted—tell your Travel Agent to include them, or apply direct to

BY THE WAY

THEODORE ROOSEVELT during his lifetime was no doubt the most widely known American. His fame as a representative citizen of his country has traveled the news of his death, judged from a letter recently received at Outlook office. It is addressed:

Th. Roosevelt Esq.
The Outlook
New York City
U. S. A.

The envelope contained a catalogue of Dutch bulbs and plants and was labeled "Overveen, near Haarlem, Holland." The sender doubtless knew that Mr. Roosevelt loved flowers, but there is no knowledge seems to have stopped.

The pessimists who bewail the low standards of daily journalism of the present time may take heart on reading a story about Horace Greeley and William Cullen Bryant told in a recent issue of the New York "Evening Post." 1849 Greeley, editor of the "Tribune," began a reply to an editorial that had been published in the "Evening Post" of which Bryant was then editor, with the words: "You lie, villain! wilfully, wickedly, basely lie!" Bryant had a long memory, for it was in 1864 that he was invited to a breakfast at which, among other guests, Greeley appeared. The host at the moment when Greeley came in was talking with Bryant before an open fire, and noticed that Bryant ignored his fellow-editor. "Don't you know Mr. Greeley?" the host inquired in an audible whisper. Bryant's whisper came back more audibly still: "No, don't; he's a blackguard—he's a blackguard!" The editors of our time, with all their faults, do not bludgeon one another after this fashion.

A Boston teacher thinks we are slightly invidious in going to the West for "howlers." She sends a selection garnered from her experience in teaching history in a high school in "Greater Boston."

Solomon is said to have been the wisest man in the world; he had about 300 wives.

Draco had things discussed by the archipelago.

It was in the reign of Diocletian that the Christians were annihilated so much.

The results of the Crusades were intellectually, politically and navigably.

James I was son of Mary, Queen of Scots, and Margaret, cousin of Henry VIII.

Charles I's reign was ended with the severing of all relations between his head and body.

Cornwallis was like a needle floating on the water. Green dropped some water on it and it soon sank.

Mr. Depew, who still goes to his desk in the New York Central Railway offices regularly, said on his eighty-eighth birthday that he stopped eating red meat twenty-five years ago and hasn't had a twinge of rheumatism since, that

he quit smoking thirty years ago and now sleeps like a baby, and that long before prohibition was enacted he ceased to drink champagne "for his stomach's sake." Furthermore, he says that he is alive to-day because fate bilked him out of a large fortune when in 1876 he had a chance to acquire an interest in the Bell Telephone Company, then organizing, and kept out of it because he was advised that "it would never be anything but a toy."

To the father of Zuloaga, the Spanish painter, the world is indebted for the revival of the Moorish art of damascening, according to an article in "Conquest," a British magazine of popular science. Señor Zuloaga himself made many fine pieces and inspired other workers in this beautiful craft. "Toledo damascening," as it is often called, is a process of incrusting gold upon steel. Fine lines are cut upon a blackened steel plate, and into these lines thin gold wire is beaten with pointed tools. The shining gold produces a brilliant effect against the background of dark steel, and when skillfully wrought into the flowers, beasts, birds, and scrolls in

which the Spanish artist delights, the result is said to be extremely beautiful, and examples of the ware are highly prized by collectors.

The "Nebraska Farmer," which was established in 1859, republishes in a current issue some prices from one of its numbers that appeared in 1862. Apparently "war prices" had not yet come to prevail in Nebraska at that time, judging from these quotations: "Wheat still sells here at 30 to 50 cents per bushel; flour at from \$2 to \$2.25 [a barrel]; corn at from 10 to 10½ cents cash—in trade sometimes as high as 20 cents; butter 8 to 10 cents [a pound]." Potatoes were 35 cents a bushel. The only item quoted that was higher in Nebraska in 1862 than at present is sugar, the price of which is given as being then from 10 to 12½ cents a pound.

A subscriber writes from Soochow, China, to say that the automobile is not at all likely to displace the ricksha in China, as prophesied lately in a paragraph from "Japan" quoted in this column. Few streets in the cities of in-

land China, he says, are wider than eight or nine feet, and even the ricksha finds it hard going on these narrow lanes when there are many pedestrians abroad. Such is the conservatism of China, our correspondent adds, that until very recently the ricksha itself was tabooed in Soochow as an undesirable foreign novelty. Only since 1921 have the city authorities of Soochow allowed the ricksha to compete with the traditional sedan chair and the patient donkey as a means of transportation.

When the king of the movies and a prince of the blood royal are to meet, who shall have precedence? This question of etiquette appears to have prevented Charlie Chaplin and Prince Mohammed Ali Ibrahim, nephew of the newly created King of Egypt, from knowing each other personally. A despatch says: "The only celebrity the Prince did not see when he visited Hollywood was Charlie Chaplin. The Prince wanted Charlie to visit him and Charlie wanted the Prince to come to see him. A deadlock ensued." Will the Genoa Conference find time to take up this international incident?

EDWARD EVERETT HALE ELICITS AN ANECDOTE OF GEORGE WASHINGTON

DR. ABBOTT's recent article on Edward Everett Hale brings to mind a little incident which may be of some interest.

He had a lecture on Washington in his home life in which were many interesting intimate stories which would not be considered of enough consequence to print in a formal history, but which gave glimpses of that great man when he was not on dress parade. Thinking he might make use of it, I sent him the following, told to me by an old lady in 1848:

Colonel David Schomp was one of Washington's scouts, living in a little hamlet in central New Jersey. One day it was announced that Washington was coming to see Colonel Schomp, and that he would stay over night. To the children this was much like saying that a circus was coming, for they had heard so many wonderful stories about him that it seemed he must be something more than a man. While he was at supper a little girl of the hamlet pushed her way into the dining-room and, looking at Washington, said: "Humph! he's only a man, after all."

This she said in a *patois* which the General did not understand. He felt sure the remark was concerning him, and insisted upon knowing what she said. When told, he turned toward her and said, "Yes, my child, only a man, and a feeble one at that."

Next morning, while waiting for his horse, he was pacing up and down the porch, his scabbard dragging on the floor. A little child of the household picked it up and began to cluck to the General, desiring to play horse with him. The members of the household were greatly scandalized, and came to take the child away. But he forbade it, and, looking over his shoulder with a broad smile, continued the amusement with his little companion until his horse arrived.

Dr. Hale sent the following letter in acknowledgment:

Matunuck, Rhode Island,
June 28, 1901.

My dear Mr. Vosseller:

I am more obliged to you than I can tell you for your anecdotes regarding Washington.

Hannibal Hamlin told me when he was first in Congress, he met a good many old Virginians who remembered George Washington personally. He said that all of them seemed to think of him and liked to talk of him as a good neighbor, a practical leader in the business and prosperity of that region, without referring to him as President or as a great military commander. Neither you nor I had the pleasure of visiting him or Lady Washington at Mount Vernon. But it is not long since I was lecturing on his home life at Philadelphia, and one of the audience asked me if I were personally acquainted with him. With thanks for your letter, I am truly yours,

EDWARD E. HALE.

ELIAS VOSSSELLER,

Corresponding Secretary Hunterdon County (N. J.) Historical Society.

The Outlook

MAY 17, 1922

PERSONAL LIBERTY? YES—BUT THE SALOON? NEVER

PROHIBITION is a legitimate subject for argument. In a democracy no question of government is beyond the reach of debate. Although prohibition is established not only by statutes but by the Constitution, there is no reason why any citizen who thinks that it is worth his while may not do all he can to advocate the legalizing of the liquor trade. He has the same right to urge unrestricted trade in opiates and poisons. He may argue for the repeal of any law or any Constitutional provision.

In the exercise of this right, the New York branch of the Association Against the Prohibition Amendment called a meeting at Madison Square Garden recently.

If the people of the metropolis are as discontented with prohibition as some of the anti-prohibitionists seem to think, if they are chafing under what they regard as a tyrannous outrage upon their freedom, they did not use this occasion to show it. Preparations had been made, not only to accommodate an audience to fill the big structure, but also to enable any crowd that might pack Madison Square itself to hear the speeches by means of amplifiers. The evening, however, was rainy, and, under that circumstance, New York's sense of outrage was not keen enough to send out an audience that would even quite fill the huge Garden.

What seemed to surprise the reporters from the press was apparently the decent character of the audience. It was not an assemblage of roughnecks. The speakers were James Speyer, former Congressman E. W. Gray, Hudson Maxim, Samuel Gompers, and James P. Holland, President of the New York State Federation of Labor.

Most of the arguments were those already made familiar by public discussion and innumerable private conversations. Prohibition was "put over" when the people were engrossed in the war and the boys were fighting overseas; it interferes with personal liberty; it is a sumptuary law, dictating to people what they shall drink; it is the product of hypocrisy, as proved by the fact that some men who voted for prohibition get drunk; it was passed because legislators are cowardly and are afraid of their constituents; it was put through by the bulldozing tactics of the Anti-Saloon League; it is the precursor of other laws

which fanatics and ascetics would foist upon the people, such as laws against drinking tea and smoking tobacco; it makes it impossible for the workingman to get his beer, but leaves it possible for a rich man, either by bribery or by a provident accumulation of liquor, to continue his habit of drinking spirits; it fosters corruption by putting a premium upon liquor so that it is worth while for men to take chances in violating the law; it has brought into existence an army of "bung smellers and cellar weasels" as the agents of the "priesthood of prohibition;" it is costing the Nation an enormous amount in loss of revenue and in enforcement; it has diverted men from legal employment to the illegal business of bootlegging; it has turned thousands of homes into miniature distilleries and breweries; it has infected the people with a spirit of lawlessness by bringing all law into contempt; it has actually increased drunkenness; it has already been repealed by the people through their refusal to obey the law; it has introduced into the Constitution, which ought to be a charter embodying general principles, specific legislation which is the province of statute law. First on the list of objectives which these anti-prohibitionists desire to reach is the repeal or radical modification of the Volstead Law. In their opinion, this law is far more restrictive than even the Federal amendment warrants. Ultimately they hope, or say they hope, to secure the repeal of the Prohibition Amendment itself. Almost unanimously (at least as far as the open public argument would indicate) they disavow any intent of bringing back into existence the saloon. No one seems ready to befriend this discredited, disgraced, disreputable, ostracized institution.

SOME GRAINS OF SALT FOR THE WET ARGUMENT

THOSE who think that they can secure a Congress that will pass an amendment repealing the Eighteenth Amendment by a two-thirds vote of each House and that they can then persuade three-quarters of the States of the Union to approve by legislative enactment this repealing amendment are welcome to try. If they succeed, we do not imagine that there will be many who will seriously complain that the repeal was put over while the people were thinking about something else—baseball, for in-

stance, in which, as everybody knows, the people can become much engrossed. The fact is that hypocrisy is not a monopoly of the virtuous or the puritanical. Many of the arguments of those who are against prohibition are quite as disingenuous as anything to be heard on the other side.

When the prohibition amendment was before Congress, we expressed our disapproval of its form. We were not in favor of an amendment making prohibition mandatory; we were in favor of an amendment placing prohibitory legislation within the powers delegated to Congress. We are not at all satisfied that the Volstead Law, designed to enforce the provisions of the amendment, is in all respects wise or practicable. We should have liked to see a different form of amendment in the Constitution and a different law on the statute-books. We think the time may come before long when the law may be modified, but we see no prospect of ever changing the amendment. Whether people like the law and the amendment or not, however, has nothing whatever to do with the question whether they shall obey it or not. They are bound to obey it or else be willing to take the consequence that comes to rebels.

To object to a law because there are some people who break it is to object to all law. Laws are meant for those who but for the penalties in the laws would do what they forbid. Minorities who do not conform to the public will as expressed in law, and excuse themselves merely because they do not like to be forbidden to do what they want to do, have the psychology of the criminal.

To hear some of the anti-prohibitionists argue that they want prohibition repealed, but protest that they do not want the saloon back, is a temptation to cynicism. Was it they that banished the saloon? Is it anything but prohibition that keeps the saloon out of business to-day? Until the anti-prohibitionists who are against the saloon have some practical proposal for doing with the saloon what prohibition has done their protestations will not carry much weight. As a matter of fact, we are much inclined to believe that nine-tenths of those who want to do away with prohibition would welcome the return of the saloon, and they ought to have the courage to say so. Of course the argument about tea and tobacco can hardly be accepted as anything but a

hoax or a joke. Neither tea nor tobacco has been a partner of prostitution, and political corruption, and insanity, and other evils which undermine society, as alcoholism has been. The arguments about personal liberty may also be taken with many grains of salt. Every such argument is as valid against the legal restriction of the use of narcotic drugs and habit-forming poisons. The sort of personal liberty idealized in these anti-prohibition meetings is possible only on a desert island.

When the critics of the present prohibition law abandon the arguments that repeat the familiar defenses of the habitual criminal, and when they confine their arguments to the real weaknesses of the law as it stands, they will get a hearing that they fail to get now.

SNOOK'S CORNERS SETS AN EXAMPLE

WE do not know where Snook's Corners is, but it is somewhere in New York State; it is a real place, and it is apparently a small village. Its name deserves to be known everywhere because its boys and girls, and men also, have set a noteworthy example in the matter of local reforestation, and have also given their reasons for doing this in one of the best statements on the subject we have ever seen. It is sent to us by a friend as it appears in an Amsterdam paper.

The thing started with the movement to stimulate interest in the rural school. The result was that the scholars were excused from their studies and assisted in planting two thousand white-pine trees across the road from the school. The purposes of the work are thus stated:

- (1) To provide a permanent wind-break for the school; (2) to do away eventually with the enormous snow-drift which accumulates nearly every year in the road and yard by the school; (3) to add potential value to the district; (4) to set an example of reforestation and to place before other communities the desirability of such local betterments.

This kind of thing is being done in many places, but Snook's Corners, so far as we know, is the first to suggest that every rural school should start a community forest. The need in New York State is evident when we remember that it has seven million acres of waste and unprofitable land which needs reforestation.

Remarkable things have been done by larger communities in the same direction. Nebraska has a fine record in this respect. An especially interesting and ambitious plan is to be carried out by the State of Massachusetts in the town of Carver, where the State owns an

eight-thousand-acre tract suitable for woodland. It is called the Myles Standish Reservation. Here it is proposed to plant the enormous number of eight million pine trees.

Such systematic efforts by States, towns, schools, and individuals afford a promising indication of what all who have studied the subject know is a prime necessity for this country. It is to be hoped that not only planting of forests, but that the planting of trees in cities and towns in places where they will grow, will be urged, so that the beauty of our residence streets shall increase and not, as is now too often the case, deteriorate.

A FEDERAL HUNTING LICENSE

THE wise conservationist seeks both to utilize and preserve. The principle of utilization, as well as preservation, underlies a bill now before Congress which provides for public shooting grounds and game refuges.

The bill begins by requiring a Federal license for all those who shall at any time hunt migratory birds. It provides that such licenses shall be issued and the fees collected through the several postmasters in the United States. It provides that the money collected for these licenses shall be covered into a special fund, not less than forty-five per cent of which shall be used for the purchase or rental of public shooting grounds and migratory bird refuges. An additional forty-five per cent is to be used for enforcing the provisions of the migratory bird treaty with Canada, for scientific investigations of bird life and administration purposes. Ten per cent of the license money is to be used to repay the initial \$50,000 which the bill would appropriate for starting the work.

There are many admirable provisions in the bill (doubtless a copy of it can be secured by any one who writes to the American Game Protective Association, 233 Broadway, New York City) which we shall not go into here.

The right of the Federal Government to control the killing of migratory birds has already been established. This bill (Senate 1452, H. R. 5823) would enable the Federal Government to carry out a constructive programme within the bounds of this right which would be of far-reaching advantage to all those interested in the preservation of game.

States, such as Pennsylvania, have demonstrated clearly the value of game refuges. States, such as New Jersey, have already demonstrated how much can be done by the application of license fees to the improvement of shooting and fishing conditions. This bill would carry into the National field principles and plans the value of which has al-

ready been thoroughly demonstrated. It is heartily to be commended.

THE MOUNTAIN WHITES

IN the mountain counties of eight Southern States live some three million people. They remain nine-tenths Anglo-Saxon pioneer stock, perhaps the purest blood in America to-day. From this stock sprang Andrew Jackson and Abraham Lincoln.

But the population has been strangely illiterate, though now, as improved educational facilities are made available, the percentage of illiteracy is being gratifyingly lessened. The improved facilities are seen in the better-trained teachers, longer scholastic terms, and especially in the larger and more suitable school and college buildings.

Prominent educational institutions in this region are Berea College, at Berea, Kentucky, and Lincoln Memorial University, at Cumberland Gap, Tennessee.

The Outlook has often called attention to the noble work at Berea. Sixty-six years old, the College now owns some six thousand acres of campus, farm, and forest land, on which are located over forty buildings. A staff of 143 workers instructs its 2,700 students. Berea gives practically free tuition to its students, furnishes rooms with light and heat at 60 cents a week, and board at 11 cents a meal, but it costs \$114 more a year to educate each student than the student pays into the treasury. Every student does some manual labor and is paid according to its value. Whether the boys or girls of the mountains desire to study agriculture, carpentry, sanitation, domestic science, nursing, home-making, typewriting, stenography, or whether they want a direct college course, the chance is theirs, as is also the chance for grown men and women to learn the "Three Rs," in a region where the illiteracy percentage has broken all records.

Turning southward, we find at Cumberland Gap a smaller but similar institution, chartered twenty-five years ago, in response to Lincoln's expressed hope to have an educational institution in the region from which he came. Cumberland Gap is located where Tennessee, Kentucky, and Virginia come together. The University bearing Lincoln's name has now nearly 750 students; its Faculty exceeds 30 members; it has a large number of college buildings, and a campus, farm, and forest aggregating almost three thousand acres. Lincoln has three units: first, the Opportunity School, devoted to elementary education (age is no bar to entrance in this department, many over thirty years old having matriculated to make up the work they should have had at thirteen); second, that of high school and preparatory

From Ella Pier, Upper Red Hook, N. Y.

A DOMESTIC SCIENCE CLASS AT BEREA

To promote home-making is one of the efforts of the institution

courses; and, third, that of the college department. In addition there are practical courses in agriculture, forestry, animal husbandry, and industry. Most of the Lincoln students earn all or a substantial part of their education by working on the University farms, in its forests, its dairy, its shops, or about its buildings and grounds.

Both Berea and Lincoln lack dormitory room. With it Lincoln would easily be a school of at least a thousand students and Berea one of at least thirty-two hundred. The opportunity to the intelligent benefactor is evident.

A NOTABLE AMERICAN

PROBABLY John Henry Patterson, who died suddenly on a train on May 7, secured the approval and respect of his countrymen far more by his humane and efficient efforts to organize relief at the time of the Dayton floods than by his remarkable success and ability in founding a business of vast magnitude. At the time of the Dayton floods of 1913 a special correspondent, Mr. Arthur Ruhl, sent out by The Outlook to report the facts, said: "What Dayton might have done without John H. Patterson and the highly trained and flexible organization, the keen, taut, loyal force which surrounds him, can only be a matter of speculation, inasmuch as 'The Cash,' as they familiarly speak of it in Dayton, was for days the stricken city's brain, nerves, almost its food and drink."

Another human and social side of Mr. Patterson's work is seen in the measures he took to bring about in his great plant right working conditions and human relationships. What he did in this direction was described in The Outlook by its industrial correspondent, Mr. Sherman Rogers (issue of August 25, 1920), in an illustrated article entitled "Putting Heart Into Work."

Mr. Patterson did not invent the cash register which made him famous, but with his brother purchased existing patent rights. He then organized the National Cash Register Company, bought still other patents, and from that time (1884) up to his retirement last year, this new industry, as it practically was, grew rapidly to enormous proportions.

The National Cash Register Company and its officers some years ago were indicted on charges of violating the Sherman Anti-Trust Law, and evidence much to the discredit of the company as to selling methods and attempts to injure rivals was brought forward. On appeal to the United States Supreme Court the conviction of the company's officials was not sustained, largely because of the Court's interpretation of the criminal clauses of the Sherman Anti-Trust Law and its view that evidence was admitted that should have been excluded. The comment of The Outlook at the time was that "if bad practices are to be curbed, it ought not to be by straining the word monopoly in criminal proceedings, but by giving power and effectiveness to the Federal Trade Commission for the prevention of unfairness in business."

HENRY P. DAVISON

THE romance of American business has rarely been more strikingly illustrated than in the career of Henry P. Davison, whose death ten days ago followed an operation for a tumor on the brain.

A little more than thirty years ago he came to New York City an unknown young bank clerk from a country town and on the strength of his unusual personality and his persistence got a position as a teller in the Astor Place Bank, a newly organized State institution which some years afterwards was ab-

sorbed by the Corn Exchange Bank. He was so elated by the honorable possibilities of his new position that—he used to tell the story himself—he went to the theater before returning to his home in a small Connecticut city and, turning to the man sitting beside him, said, "Do you know who I am?" "No," said the astonished stranger. "I am the paying teller of a New York bank!" exclaimed Davison. It happened that the bank of which he was first receiving and then paying teller was the bank in which the account of The Outlook was kept, and there are several members of its staff who recall with pleasure the imperturbable but friendly courtesy and confidence-inspiring efficiency of the young teller. He made his mark and attracted the notice of leaders in his profession. He was repeatedly promoted; became the cashier and then the president of one of the smaller but important downtown banks; was then called to the First National Bank, and from there was invited by J. Pierpont Morgan to become one of his junior partners. His genius for organization and administration was early recognized, and this gift combined with high integrity and with a desire to serve society gave him a very wide and varied influence.

When the war broke out, he threw himself into the work of organization both on the financial and on the human side. He became Chairman of the War Council of the American Red Cross, and in that capacity had to deal with the greatest humanitarian problem that civilized society has probably ever had to solve. He left his business, went to Washington and established his quarters, and made more than one trip to Europe. Some of the time he visited

(C) HARRIS & EMMER

HENRY P. DAVISON

the fighting front, where on one occasion his life was endangered. His distinguished service as the chief administrative officer of the Red Cross brought him honors and decorations from all the Allied Governments.

We do not recall the death of any private American citizen during the last decade which has elicited more genuine tributes of both sorrow and admiration from so wide a circle of friends and associates. Not only do these tributes come from his fellow-financiers but from men of science and letters. For example, Dr. William Welch, of Johns Hopkins University, said: "I rejoice in the pride in having engaged the association and friendship of Mr. Davison, in the memory of his fine qualities, and in his benefactions and achievements." Dr. John H. Finley, formerly the Commissioner of Education of the State of New York, who was associated with Mr. Davison in the Red Cross work during the war, said: "No words can tell you my sorrow over the loss of my beloved comrade in the greatest of crusades."

Henry Fairfield Osborn, the head of the American Museum of Natural History, said: "The American Museum is deeply indebted to his intelligence and devoted service of many years as its treasurer."

Mr. Osborn made a very handsome fortune during his short and active life—short because he died at the comparatively early age of fifty-five. But he made much more than a fortune. He impressed himself upon the constructive financial and industrial life of the country in a way which confirms the judgment of Henri Bergson, the distinguished French philosopher, who said after a visit to this country that he found that the Americans did not worship the almighty dollar, as they are sometimes said to, but that they regard the dollar as the unit of measure of achievement and service.

THE WORLD'S GREATEST SUSPENSION BRIDGE

CANADA and the United States are about to be connected by the longest and largest single-span suspension bridge in the world. It will cross the Detroit River at Detroit.

Construction work has been started by C. E. Fowler, chief engineer of the project. A joint Canadian-American company, authorized by the Dominion Parliament and by Congress, has been organized to build the bridge.

The bridge's span is to be 1,803 feet, 203 feet longer than that of the Williamsburg Bridge. The weight of the bridge and approaches will be 107,000 tons. Six of the enormous cables are to be twenty-one inches in diameter. The lower deck will contain four electrified

DETROIT RIVER BRIDGE AS IT WILL LOOK WHEN COMPLETED

railway tracks. The upper, or highway, deck will be 97 feet wide, with two roadways carrying six lanes of traffic, two sidewalks, and two trolley tracks. The clearance above the river level will be 110 feet. The steel arched portals will give a towering architectural effect as impressive as that of the Woolworth Building.

Railway trains, which are now ferried laboriously across the river, will go over the bridge under their own power.

THE TURN OF THE BALANCE AT GENOA

RECENT despatches from Genoa are not such as to enable us to judge the merits of the issue which has ranged France and Belgium on one side, and Britain and Italy on the other. Evidently France and Belgium want more safeguards placed about the property rights of foreigners in Russia than are demanded in the note which other Powers have presented to the Russian Bolsheviki. It is reported that these demands were drafted by three experts—one French, one Belgian, and one British—and that they have been presented in the name of most of the Powers gathered in Genoa. Britain evidently is apparently willing to make some concessions to the Communists which France, and particularly Belgium, believe to be dangerous for the future stability of international commerce, and even the institution of private property. Britain needs trade as a reviving force for her own prosperity so much that she is willing to take some chances. Belgium, on the other hand, needs for her own prosperity the thorough safeguard-

ing of property rights, and France is supporting Belgium.

As the Chairman of the Belgian delegation pointed out, Belgians have invested several hundred millions of dollars in Russian industries, and in consequence have owned many factories, producing a vast proportion of the foundry output, the steel rails, the chemical products, the glass-ware, and the window glass of Russia. What Belgium wants is to have Russia acknowledge that these industries belong to Belgians. Apparently Britain is willing to recognize the right of the Russian Government to seize these properties without the consent of the owners, but asks Russia to pay the Belgians (and other foreigners) that have claims to such properties. The Bolshevik attitude seems to be summed up in the phrase, "Heads I win, tails you lose." The Bolsheviks argue that since the Bolshevik Government recognizes no right of private property, Russia owes the foreigners nothing, while since other governments recognize the right of private property, they owe the claims made by Russians upon them. According to one report, the French are ready to concede the right of Russia to seize property for the use of the Government but not for the purpose of selling it to the highest bidder. As we go to press the Conference was awaiting the Bolshevik's answer to the demands presented to them.

It is conceivable that the Russian answer may be such as to leave this issue acute as between France and Britain; but it is expected in some quarters that Russia's answer will be satisfactory neither to Britain nor to France. Of

course it is to the interest of Russia as well as Germany to drive as many wedges as possible between the Allies, and the Russians are acute enough to know that the interest of the Bolshevik Government lies in playing upon England's need for international trade.

Everything that has happened has given Americans reasons for gratification that they are not represented at Genoa. It is, for example, obvious that the very discussion which has been going on would not have been possible if the Powers were sticking closely to the conditions which they laid down when the Genoa Conference was called; for all this discussion is really a debate as to how far they shall depart from those conditions. If the American Government were represented at Genoa, it would either have to abandon its policy with regard to Russia, which is hardly conceivable, as it has been followed by both the Wilson and the Harding Administrations and is based on fundamental American ideas of what constitutes honor and credit in business, as well as good faith in government, or else it would have to take the side of France and Belgium in a question which is essentially European, and involves European international politics.

As to threats or warnings of the break-up of the Entente, there seems little reasonable ground for fear. It is inconceivable that Lloyd George would consent to any arrangement that would lead Britain to abandon France for the sake of establishing relations with the Bolshevik Government of Russia. Even some of the Germans, as indicated by the comments of a German financial paper, realize that Russia in her present condition has no source of strength for any other nation, for by her Bolshevik Government she has, as the Bourse "Courier" says, been reduced to a "scrap-heap."

WU WINS

IN the game played between the Manchurian general, Chang, and the general of certain northern Chinese provinces, Wu, for the control of what they both call Chinese unification, General Wu has turned out to be the victor.

Some attribute Chang's defeat to the failure of Sun Yat-sen, the leader of the so-called liberals of the south, to fulfill his promise of attacking Wu from the south while Chang was attacking from the north.

Such military assistance on the part of Sun seemed to us to be very problematical because of the difficulties of railway transportation. Chang could scarcely have relied on such aid. He evidently believed himself to be strong enough alone to secure the upper hand.

Whether, however, he counted on Sun's help and was disappointed, or relied on his own resources and was overconfident, in either case he failed. His troops were put to rout. Most of them are reported as wandering about, harrying the land and committing murder and devastation.

According to information we have received, the victorious general, or super-Tuchun, Wu Pei-fu, had the sympathy of the Christian missionaries in China. This sympathy is attributed in part to the fact that one of the generals under Wu is himself a Christian and is known as the "Christian General."

If there was any real issue, vital to the development of China or of concern to the outside world, between these two super-Tuchuns, it has not been made clear to us. In fact, so long as all Chinese government except local or village government is dominated by Chinese military governors, these Tuchuns and super-Tuchuns, it is hard to see how any great progress can be made toward the establishment of that kind of order in the Far East which will enable other nations to treat China on terms of equality.

MR. BEVERIDGE'S VICTORY

IF Senator Reed, of Missouri, is re-nominated in the Democratic primaries as candidate for re-election to the Senatorship, the result will be obviously a defeat for ex-President Wilson. There can be no question about this, because Mr. Wilson has written open letters advocating Mr. Reed's defeat, calling him a "marplot," and making it plain that if the Democrats of Missouri wish to stand by him they must keep Mr. Reed out of the Senate. In this case the issue is drawn clearly and is unmistakable.

No such issue was evident in the Republican Senatorial primaries in Indiana. Naturally, Democratic leaders and organs would like to think that the failure of Senator H. S. New to secure the nomination at the hands of the Republican voters of his State is a sign of a revolt against the Administration of President Harding. They have so interpreted it. The New York "World," for example, declares without qualification that "the Republican voters of Indiana have repudiated the Harding Administration." It is true that Senator New is a personal friend of the President and has proved to be one of his most loyal political supporters. It is true that in many respects Mr. Harding and Mr. New have long belonged in the same group within their party,

that neither of them has ever seemed restive under restraints of party authority, that they have had congenial interests as newspaper men and as Senators, and that President Harding has made no secret of his confidence in Senator New. That the President desired Mr. New's renomination is, however, purely a matter of inference. There is no evidence, and no claim on the part of any one that there is evidence, that Mr. Harding either as an individual or as President undertook to exert the slightest influence in the primaries in Indiana. Whatever lesson the Indiana primaries have for the Administration, it is not the lesson of an open defeat.

There is nevertheless a lesson there for the Administration and for all party leaders.

That lesson consists, not so much in the fact that votes were cast against New, as that they were cast for Beveridge.

Albert Jeremiah Beveridge was born almost sixty years ago on an Ohio farm. From there his family moved to Illinois. His boyhood was full of hard work. He followed the plow; worked on the railway; labored as logger and teamster. To an American with a mind and a character such a boyhood is not without promise. It did not prevent young Beveridge from going to high school and to college. He was graduated at De Pauw University, from which he later received the degrees of Master of Arts and Doctor of Laws. He became a lawyer and gained more than a local reputation for oratory. He was soon in demand as a campaign speaker. By the age of thirty-seven he was elected from Indiana to the United States Senate, where he served with conspicuous ability for twelve years.

Before his second term was completed his party, under President Taft, fell into the hands of the reactionaries. The progressive policies for which he had done good service during and immediately after President Roosevelt's Administration were made the object of attack from within the party which had been promoting them. As a consequence the Republican party began to disintegrate, and Indiana, always a doubtful State politically, chose as a successor to Beveridge a Bryan Democrat. The succeeding year was the crucial year of 1912, the birth year of the Progressive party. Like the vast majority of Republicans, Mr. Beveridge joined that party and became one of its leaders. In making his choice he was not swept off his feet by the emotional wave of the time, as were many; he made his choice deliberately and with full knowledge of what it meant. Since that time ten years it has been—he has been

devoting himself largely to the study of great forces in American history. During his Senatorship he showed on more than one occasion his mastery of American Constitutional law and principles, particularly in his speech in defense of the Child Labor Bill, which embodies one of the most cogent of modern legislative arguments. During the campaign of 1912 he made a speech as Chairman of the Progressive Convention which set forth the principles of the Progressive party as summed up in his telling phrase, "Pass prosperity around." He gave currency, if he did not invent it at that time, to the phrase "the invisible government," which characterized that partnership between crooked business and crooked politics which the Progressive Movement assailed. He approached, therefore, his studies of these forces by no means as a novice; but he has used these ten years with profit both to his own mental growth and to the instruction of his fellow-countrymen; for he has produced during these years his monumental work, "The Life of John Marshall." He has not only been living in mental companionship with the man who more than any other made our written Constitution a thing of life and growth, but he has also by his book given an understanding of our Constitution to Americans who otherwise would have understood but darkly.

From these labors Beveridge went back to Indiana. There he went up and down the State delivering lectures and addresses on those principles of American government which he had been studying and which are essential to the permanence of our institutions. Until he opened his primary campaign he made no political appeals, but he established himself in the minds of the people of his State as a leader of thought, as he has been a leader in action. He preached no new or strange doctrines; he rather gave the old ideas embedded in the American Commonwealth new vitality.

Thus Mr. Beveridge has, by no mere chance, but by continuous labor for principles in which he believed, and even by the sacrifice of public office to scholarship, yet without loss of contact with the lives of his neighbors, identified himself as neither radical nor reactionary, but as what we have come to know in America as a Progressive.

In the reaction against the Wilson Administration, which the voters believed carried internationalism to a point destructive of National independence, and carried progressivism to a point of danger to social and economic stability, the managers of the Republican party may have thought that they saw a reaction against progressivism.

If so, they should take warning from what has happened in Indiana. There are signs that the Republicans who are in power have not fully learned the lesson of the last twelve years; that they think that public impatience with red tape in the Civil Service means public approval of the restoration of the spoils system; that public impatience with impractical doctrinaires means public approval of favoritism to special interests; that public repudiation of the political bungler means public approval of the political boss. If the Republican managers are wise, they will rid themselves of such illusions.

Opponents of the bonus have seen in the defeat of Senator New a repudiation of the bonus itself; critics of Senator Newberry have seen in the defeat of Senator New a vindication of their views about funds for election purposes; advocates of this and that find in the defeat of Senator New an indication that their own pet theories are on the crest of the wave. Perhaps there will be some to interpret it as a mandate concerning daylight saving. Elections do not turn on such specific matters as that, except when some great issue is presented on which the minds of all the people are centered. In this case there was no such issue. The conflict was between two types of political thought. The lesson to the Administration and all Republican leaders is that, in a State experienced in politics, victory went to the practical, scholarly Progressive.

INDUSTRIAL PEACE OR INDUSTRIAL JUSTICE?

WILLIAM ALLEN WHITE, of Kansas, makes a defense of the Kansas Industrial Court in an article lately published in the periodical called "The Nation's Business," which represents the National Chamber of Commerce. What interests us particularly in this article is his assertion that leaders of labor and capital who oppose the act (for the State Federation of Labor and the State Employers' Association denounce it with equal bitterness) misunderstand it in the same way—that is, both suppose its end is to make peace. Mr. White maintains, rightly we think, that all courts are set up to do justice, and to establish peace only as a by-product of justice. Amplifying this thesis as applied to industrial matters, he argues:

In the labor conflict, as it has progressed during the last two centuries, each settlement has been a truce. The conflict has been constant and irrepressible. The truce or armistice

has represented only the degree of fear which one side was able to impress upon the other side to stop the active fighting. Upon the whole, labor has been the winner; but while labor has won much, capital has kept much more, and no principle has been established upon which to reckon what is the right or the wrong in the basic contentions of the war.

Get a plenty while you are getting is the only maxim adduced after two hundred years of strife, with perhaps a codicil; then get ready to get more.

And, by reason of the long tradition and established habit, neither combatant wants the war to end. Neither asks for justice. Each is after peace, enforced peace if necessary, but peace if it can get the best of it; and in times of peace each side prepares for war.

The courts, and especially industrial courts such as that in Kansas, must not, therefore, act merely as arbitrators of quarrels or bargainings, but must establish and define principles of justice as between workers and capitalists in their relations of partnership in production. Essential rights, Mr. White holds, would be based on recognition of such truths as that labor is not a commodity, that wages must be fixed on the basis of decent living for citizens, that the State is entitled to have good citizens fully as much as investors are entitled to good profits. Justice first, peace afterwards, is the contention; or, as Mr. White puts it, "The right to peace depends upon the establishment of justice."

That labor leaders and capitalists are opposed to this view is not surprising; they are captains who want to win. Against their combative instincts stands the right of America to maintain one hundred per cent American standards of living, and the right of the State to an intelligent and contented voter. "The whole miserable business of the armed truce or the open conflict in industry is a tax upon living, a tax which non-combatants must pay."

This view affords an interesting contrast with recent utterances of the leader of American organized labor, Mr. Gompers. The more his recent remarks about the courts and the Constitution are analyzed, the more is it evident that he is out neither for peace nor for justice, but for partisan victory. He might argue that the courts *ought* not to have the right to interpret the Constitution, or that the framers of the Constitution did not so ordain; but that they actually have the right to-day is simply an established fact. We have quoted his exclamation, "God save labor from the courts!" which is morally revolutionary and a totally unjust attack on the integrity of the bench. In a later hearing before the Lockwood Committee, he is quoted as saying that he believed in collective bargaining for employees but not

always for employers. Faced with flagrant instances of corrupt conduct by labor unions and of the breaking of contracts made by them, he flatly refused to see any help in legislation or courts and declared that the remedy lay in gradual reform evolved within the unions. He favored legislation that would give protection to labor, but he would be "afraid for his country" if legislation regulatory of labor was adopted, and believes that wealth controls courts and legislation.

This is straight Bolshevism, philosophically speaking, although Mr. Gompers honestly believes that he is opposed to Russian Bolshevism root and branch. Whatever new forms the industrial question may take and however expansion in the direction of industrial courts may stand the test of constitutionality, it is certain that justice to all and resulting peace to all must be the object in view. That object is far removed from blind insistence by either contending element to have its own way first, last, and all the time.

READING FOR WORKERS

OUR excellent contemporary the "Literary Review of the New York Evening Post" recently published a list of fifty books which have been chosen by the Literary Committee of the "Workers' Education Bureau"—whatever that may be—from two hundred and fifty titles submitted by a group of teachers and professors of literature. The "Literary Review," in presenting this list to its readers, says of it: "Primarily intended to fill the needs of a special group—that of the workers—its general character gives it a range as broad as the interest in good literature."

We turned to this list with great enthusiasm, but turn from it with disappointment. It contains some classics and some excellent examples of modern writing both English and European. Its extraordinary variety—perhaps we may say the extraordinary mixture which it contains—is indicated by the fact that the Book of Matthew and the Book of Job from the English Bible constitute the fifth item on the list and "Sister Carrie," by Theodore Dreiser, is the eleventh item. We can understand why workers should read Kropotkin's "Memoirs of a Revolutionist," but we do not quite appreciate the value of "Main Street" from the workers' point of view. Workers, whether they be hand workers or brain workers, need not merely facts about life but the inspiration and comfort that come from the ideals of life, and so the Workers' Education Bureau

has very wisely put in its list the "Oxford Book of English Verse," Walt Whitman's "Leaves of Grass," and John Masefield's poems. But why "Spoon River Anthology" should be recommended to workers tired out and often disheartened by their own problems we fail to understand, for the "Spoon River Anthology," in spite of its occasional power and touches of genius, is one of the most laborious and depressing books of modern times.

The prime object of a list of books for a worker is not, we conceive, to give him a survey of literature, but to help him to understand how other men have lived and how other men have dealt with and solved, or partly solved, the problems of life which he is facing. Being disappointed, from this point of view, with the Workers' Education Bureau's list of fifty books, we took a pencil and paper and jotted down a list of our own without any consideration regarding the relation of the titles to one another. It is a jumpy lot, perhaps; it has no co-ordinated, chronological, synthetic, analytic, nor any other kind of pedagogic merit. But at least it constitutes a list of books which have entertained, interested, and encouraged one worker. So to our list:

"Oxford Lectures on the Civil War," by James Rhodes, a masterpiece in cameo form of American political, military, economic, and social history.

The famous third chapter of Macaulay's "History of England," which gives a vivid and picturesque survey of the conditions of the workers in the period of the great English Revolution of 1688, out of which the United States has got much of its own freedom.

"The Biography of Benvenuto Cellini," which tells how artisans lived in the old days of the Italian republics—a glorified and absorbing dime novel if ever there was one. If the reader wants "sex stuff," he will get it here related with utter candor.

"Mémoires et Récits," by Frédéric Mistral, the great Provençal poet of France, full of delightful stories of French folk lore and French farm life.

"The Poems of Theocritus," translated by Calverley, which will give the worker some idea of the way the husbandman lived in ancient Greece. This little book deserves to be included for one thing alone—a dialogue between two Syracusan women who go out to see a great military parade in Alexandria and talk exactly like a couple of flat dwellers in New York on their way to Fifth Avenue to see Joffre and his escort regiments pass by. Nothing in classical literature that we know produces so vivid an impression of the solidarity, in time as well as in class, of the human race.

"Tales of Mean Streets" and "A Child of the Jago," by Arthur Morrison, as complete in their detail of ordinary people as Sinclair Lewis's "Main Street," and far more cheering and inspiring.

"Memoirs," by General Grant, which should be read, not because it is military history, but because it is the self-revelation of a plain American who, without suspecting it, had a touch—even more than a touch—of literary genius.

"The Bible in Spain," by George Borrow. Borrow has written one of the best pictures of Spanish life of the so-called lower orders in both city and country that can be found in English literature. The book is not half as pious as its title sounds, but it is intensely human.

"My Prison" (Le Mie Prigioni), by Silvio Pellico. If anybody thinks that the Reds and Anarchists in this country have suffered injustice in prison, he ought to read this record of a patriotic Italian revolutionary.

"Theodore Roosevelt's Letters to His Children." Modern literature does not contain a more beautiful picture of family and child life than these letters, which we venture to say will prove to be an American classic.

"The Country of the Pointed Firs," by Sarah Orne Jewett, a too often forgotten literary artist of New England. Her book is a series of detached stories of New England farm and village life, sometimes somber, sometimes cheerful, which, we are inclined to think, will have a place in literature when "Main Street" is forgotten.

The poems of Emily Dickinson—another New England genius of an extraordinary type, as pure a product of America as Walt Whitman.

Bunyan's "Pilgrim's Progress." Perhaps the greatest book ever written by an English-speaking workingman—a tinker.

"The Life of Pasteur," "The Life of Dr. Trudeau," and "The Autobiography of Dr. Grenfell," three physicians who gave themselves to the cause of helping their fellow-workingmen meet the most agonizing problem of life—the problem of sickness and death.

"The Siberian Exile System," by George Kennan. Why more people do not read at this time this very extraordinary account of the despotism which was the direct progenitor of Bolshevism we do not understand.

"The Adventures of François," by Weir Mitchell, and "Scaramouche," by Sabatini. Two rattling good stories of the French Revolution—the first written from the point of view of the aristocrats and the second from the point of view of the proletariat.

"Two Years Before the Mast," by

Richard H. Dana. We suppose that the Workers' Education Bureau will admit that seamen work. Any reader of this great American classic certainly will admit it.

"Seven Great Statesmen," by Andrew D. White. The worker needs to know something about political history. Dr. White's seven portraits are penned by a scholar, but in the most engaging human colors. Among the portraits in this volume is one of Cavour, who liberated Italy, and therefore liberated the Italian worker.

Thoreau's "Walden." This is not only a master work of English diction, but shows that happiness consists, not in things, but in attitude of mind.

The story of the life of Abraham Lincoln. Either Lord Charnwood's "Life" or Rothschild's "Lincoln, Master of Men," the first by an Englishman and the second by an American Jew, gives the best one-volume account we know of the great patron saint of workers.

"Pan and the Twins," by Eden Phillpotts, a slight but agreeable story of the Roman countryside in the very early days of Christianity. The worker who wants to get a little glimpse into the

classic life and the classic spirit can get it here.

"Roman Farm Management," by Cato and Varro, translated by A Virginia Farmer. The husbandman is the oldest type of workingman, as this delightful book so clearly reveals. It combines the flavor of Roman cured hams and Virginia cured hams in an appetizing fashion.

If not Senator Beveridge's "Life of John Marshall," at least Magruder's one-volume Life of that statesman, who literally gave to the United States permanency as a nation and without whose courage and determination as Chief Justice of the United States, in spite of Mr. Samuel Gompers's distrust of the courts, there would be no American labor unions to-day, because there would be no American Republic.

Charles Reade's "The Cloister and the Hearth" and "Put Yourself in His Place." The first is a stirring story of the life and adventures, the dangers and joys, of the worker in Europe in mediæval times. The second describes the vices and the justifications of the labor unions when they were first founded in England seventy-five years ago. No "best seller" is more of a

thriller than these two novels, and yet they have a profound historical value.

Possibly Tom Watson's "Story of France," which contains a very colorful and on the whole accurate picture of the French Revolution written in what H. L. Mencken would call "the American language." No Englishman could ever have written such a book, and therefore it can fairly be called a product of American literature, and it is a good product too.

Lord Bryce's "Modern Democracies"—or, if not the whole of it, at any rate, Chapters XXVIII to LVII inclusive, which describe social and democratic progress in the United States, Australia, and New Zealand from the worker's point of view.

The foregoing books have been put down at haphazard, and none of them, we believe, appears in the list of the Workers' Education Bureau. We are quite certain that the reader of the books on our list will have a good time, and we are inclined to think he will get a fairly comprehensive grasp of the problems of the worker from mediæval times to the present.

LAWRENCE F. ABBOTT.

THE DANGERS AND DIFFICULTIES OF GENOA

I—IS GENOA GOING OR COMING?

STAFF CORRESPONDENCE FROM WILLIAM C. GREGG

THE Genoa Conference is composed of thirty-four nations with as many policies and one thousand delegates with as many interests. The common aim is to get more than is given. Unless they can rise to the plane of constructive statesmanship, the end will be worse than the beginning. Can they rise? It doesn't seem possible, yet the urge is very great; stranger things have happened.

But what do they desire so profoundly? *To improve the value of their money.*

The value has fallen for two reasons:

First, because they spent more than their income in running their governments.

Second, they bought more imports than they had exports to ship.

An ordinary man would suppose that the remedy lay in reversing these two faults. True; but that will cause unemployment and more self-denial by a good many people than those good many people want to suffer.

There is another remedy, temporary, but effective for a while. Loans (credits). Can one nation that is running behind lend to another that is worse off?

Why not? Ah, here is the solution: Why not have all the thirty-four nations

join in one general loan, one bond issue to be used to bolster up the weaker sisters, they repaying the loans as soon as possible?

If there is strength in numbers, this is a capital suggestion.

But there may be weakness in numbers when unity of action is required; there may be favoritism in loans, friction in administration, and weakness in enforcement of agreements.

The plan is coupled with war prevention, but it carries the seeds of more wars through jealousies, factions, and defalcations.

The majority of the nations are now living alone and living as best they can. Suppose there are thirty-four farmers in the same State, but badly scattered; a half-dozen of them are broke, the rest just getting along. These farmers don't use the same methods nor speak the same language; some Non-Partisan Leaguer proposes that they form a company, each taking so much stock, the company issuing bonds for the benefit of all, but in proportion as they are hard up. Would it work? It never has.

Could thirty-four nations in Europe, Asia, Africa, and America, each hard up, work a similar scheme?

Many are thrilled at the announce-

ments: "These new times require new men and new ideas." "The world has outgrown old financial methods."

You and I want to see the new heaven and the new earth too, but we don't want too much new earth on top of us!

Let us try and imagine how this international underwriting syndicate would work. The prospectus might say: "Each nation will agree to subscribe its proportion of, say, five billion dollars of capital. The funds will be in the hands of a managing committee, composed of a member from each nation but voting in proportion to the capital owned."

In order to see how this little enterprise would work let us assess ten per cent on the subscriptions.

Austria comes first on the list; she has "subscribed," although she is interested only in absorption; but to be regular she must pay something. In what? Her paper krone? No, it is worthless. In gold? She hasn't any. In lumber? There isn't a lumber department organized yet, so Austria will please step out of the line for a while.

Belgium is next. Belgium looks prosperous; she hasn't asked help for quite a while. How will she pay her subscriptions? "Not in paper; gold, if you please." But Belgium has only 4½ per

cent of gold against her outstanding paper money; she can't reduce it; she could furnish manufactured goods if some one supplied the raw materials. No, that has not yet been worked out. It is very complicated. Could Belgium pay her subscription out of her revenues, her receipts from taxes or something? Belgium looks embarrassed, for her total income is only a little over half her expenditures, according to recent statistics.

"Belgium, will you please step out of the line for a little while?"

Britain is reached. Now we have clear sailing. "Mr. Lloyd George, you haven't yet determined the amount of your subscription."

"No, not yet, but it will be very large. It will depend on how we get along in paying what we owe Uncle Sam; and the amount must be approved, anyway, by Parliament."

"You don't say so! When did you make that rule?"

"It was put into the resolution permitting me to meet you all at Genoa."

"Well, but, Mr. George, we are expecting great things from England; we might say, she is the keystone in this financial arch. Perhaps you could do something for us out of your revenues? You had a surplus, we believe, last year of nearly \$200,000,000."

"Well, some of us called it a surplus, but others thought we should not include sales of war supplies with revenues. They go so far as to claim that, leaving out such items and placing regular income against expenditure, we show a deficit in the year just closed of perhaps \$500,000,000."

We can take a recess at this point, for we seem to be getting nowhere with our world credit corporation.

Another plan, said to be suggested by Mr. Lloyd George, is for Germany to issue bonds and give them to France in payment for reparations, France indorsing them and giving them to Eng-

NEXT WEEK'S OUTLOOK

is our annual

RECREATION NUMBER

It will contain an eight-page illustrated section of America's playgrounds from coast to coast. Travel and sport will share the issue with scenic beauty.

land in payment of her war debt, England in turn indorsing them and handing them to the United States in payment for what England owes Uncle Sam.

At first blush this looks clever and feasible. America gets double indorsements, which ought to make the German bonds good. If Germany fails to pay, both France and England agree to pay.

Let us see how it bears analysis:

First, what would America do with such bonds? It is proposed that they run for a long time, longer than the terms America expects to give England, for the plan is based on Germany paying. Can America sell these German bonds on the open market? And if so, at what price? Their value would be highly speculative, dependent on all European complications instead of the conditions behind purely British bonds.

Second, would the indorsements of France and England place the proposed German bonds ahead of or behind the present obligations of France and England?

Third, this plan would pay England's debt to America, but not France's debt to America. You remember, France pays England when she indorses these German bonds in favor of England, but she still owes America. There is no suggestion in this plan by which France discharges her obligation to us.

Whenever we are free to deal *alone with France*, America knows exactly what to do. The debt of France to us will be canceled with the utmost satisfaction.

France is to-day the least spoiled of all of Europe.

Suffering much, she does not whimper.

With the hardest financial problems involving her, she is farthest on the road to courageous economies.

The greatest objection to this German bond scheme to me is that Germany will not expect to pay and will not pay.

She now refuses to tax her people as the people of the Allies are war-taxed. She stalls and stalls, and much of the world seems to like it. The prospect of the United States ultimately canceling these bonds "in order to stabilize Europe" is so good that many a Hun is smiling about it to-day.

And with good reason, because in less than three years, and before they have paid much more than the expenses of the Rhine armies, they have seen the Treaty of Versailles and the League of Nations ignored, if not flouted, by England and Italy. They have seen the United States withdraw safely across the Atlantic—safely for America and safely for Germany.

To-day there looms at Genoa a combination of Germany and Soviet Russia with infinite possibilities of evil, with undisguised hatred of France and all that she represents, with determination to divide and a hope to destroy the other former Allies, certainly to destroy further alliance, and to recover as much as possible of what yesterday they seemed to have lost.

II—A BOMB UNDER THE BRIDGE

EDITORIAL CORRESPONDENCE FROM ELBERT FRANCIS BALDWIN

WAR has ruined Europe. It has killed millions of men. It has mutilated other millions. It has sunk millions of tons of shipping. It has destroyed mines, forests, orchards, buildings of all kinds, even entire towns and cities.

Worst of all, it has destroyed confidence.

How can confidence, reciprocal respect, security, credit, be restored? If these things were restored, Europe would not now be groaning under the weight of onerous armaments, tariffs, exchanges, debts. In particular, there would not be so many men out of work.

To change all this was the great problem before the recent Conference of the

principal Powers at Cannes. They decided that they would have to invite to a general Conference at Genoa the nations which would agree to certain elementary principles of civilized international intercourse. Among these principles were:

The reciprocal respect of national systems of ownership, internal economy and government, and non-interference with the same.

Respect for the property and rights of foreign capital.

Recognition of debts which have been or may be undertaken or guaranteed by the state.

Obligation to restore or compensate all foreign interests for losses by confiscation.

Maintenance of a legal and juridical system which sanctions and enforces commercial and other contracts with impartiality.

Financial and currency conditions which offer sufficient security for trade.

An undertaking to refrain from propaganda subversive of order and established political systems.

An undertaking to refrain from aggression against other nations.

The invitation was accepted by the nations of Europe—especially by Germany and Russia.

They came to Genoa. For the first time all the European victors and vanquished and neutrals in the late war

met together in an attempt to reunite the European family.

They are nations of diverse political and social organization. They are represented here at Genoa by men of every class and party.

All of them feel the necessity of deliverance from national isolation and the necessity at least of neighborliness, if not of brotherhood. At all events, their common object is to seek a common economic salvation.

For a week the Conference has been in session. All its members have met on a plane of perfect equality. All apparently have been pursuing a common end, no matter how certain individual and national ambitions may have been hidden.

One of these aims has been Germany's ambition to rule Russia. Commercially and economically before the war Germany made great progress in this direction. Her clever, expert, hard-working industrialists and financiers were everywhere to be found in Russia.

Politically Germany's chance came with the Russian Revolution and destruction of legitimate government five years ago. She sent Lenine—a Communist and propagandist who hated all civilized government—into Russia with the deliberate intention of producing anarchy there, and then, at the proper time, she would reap the advantage.

Day before yesterday Germany proclaimed to the world the outward sign of that advantage. She had concluded a treaty some time ago in Berlin with the Bolsheviks. But neither side had signed it there, for each wanted to come to Genoa with free hands, hoping thereby the easier to strike at a divided Europe, especially at a divided England and France. Perhaps Germany and Russia could divide Europe still further before starting to play their strongest trump card.

To their disappointment, despite certain differences and tendencies, France and England were much more a solidarity than had been supposed. The same was true of the rest of Europe. Hence, after waiting a week to look the ground over, the Germans and Russians decided that there was really nothing to do but to play their trump card. So, without informing the other delegates and behind their backs, the Germans and Russians suddenly signed and published the hitherto secret treaty. They signed it *here*, though they are guests of the Italian Government and members of an international Conference envisaging a whole continent, and not one or two nations only. The Germans and Russians cannot, apparently, play a straight game.

To-day, in talking to some of us, Mr. Lloyd George, British Prime Minister, said:

This is no informal act. We all agreed to be on a plane of equality in every respect and we have been. We have been in apparent accord

that we should discuss matters together and not in separate paths.

What happened? Behind the backs of the commission which had the subject of Russia in charge another and a diverse work is done. It gives us a sudden blow which no one expected.

Such an act seems to me an attempt, absolutely, of sabotage. I do not mean the shipwreck of the Conference. The act might have led to shipwreck, however, but I do not believe that it was introduced with that intention.

This final sentence may have comforted the Germans and Russians a little after their castigation.

The subjects comprised in the Russo-German treaty are precisely those which have been forming the object of negotiations between the Russian representatives and those of the other Powers, Germany included. Last week I heard the German Chancellor proclaim that his delegation would loyally co-operate with the other delegations in the solution of these questions. Of course the separate treaty with Russia violates that loyalty. It also violates some of the conditions of the Cannes invitation. Finally, it violates the treaty of Versailles.

As a result, by the sentence of the Allies, Germany, as signatory of the Versailles Treaty, must annul the Russo-German Treaty or have no voice in the negotiations between the other Powers and Russia. Naturally, Germany has chosen the latter course.

The Russo-German Treaty is apparently economic in character. The German and Russian Governments mutually renounce repayment of war expenses and war damages. They declare that all questions of public or private law will be settled according to reciprocity. They agree to resume diplomatic relations. They declare for a mutual trade based on the principle of the most favored nation and undertake to aid each other in attenuating their economic difficulties. Germany, in particular, renounces all claims resulting from Bolshevik measures which have affected German citizens, on condition that the Bolshevik Government does not grant reparation for similar claims from other Powers; the implication from this of course is that if the Bolshevik Government does grant reparation to other Powers, it must also to Germany. This annulment of the rights of private persons and the most favored nation clause have put both Russia and Germany in good humor.

What secret clauses there may be is naturally not disclosed. But the treaty is too one-sided, as favoring Russia, not to have such.

The treaty stiffens the backs of both Germany and Russia.

It stiffens Germany's back because at last she has been actually displaying to the world a will of her own; she is no longer the plaything of the Entente! In

the second place, and chiefly, it gives Germany the satisfaction of feeling that, no matter what Russia does, henceforth she (Germany) is going to win. She will stop Russia, if she can, from making reparations; she will encourage Russia to resist Allied requests, although she knows that the United States Government, for one, is not likely to cancel the Russian debt to it or assent to the cancellation of the claims of our citizens against the Soviets. If Russia should yield, Germany has still the upper hand; if Russia resists, Germany is "the whole show" and Russia becomes an entirely free field for German exploitation—indeed, in such an event, Russia would be but a vast German colony.

The treaty stiffens Russia's back because she can now defy the rest of the world, as she never could by treaties made with the Baltic States, or Turkey, or Persia, for instance. She has now made a treaty with the one Power able and ready and willing thoroughly to rehabilitate her. Hence she defies the other nations by practically declaring to them that if they do not accept the conditions accepted by Germany then Germany will have the sole charge of remaking Russia.

If all this seems purely economic, between the lines of the treaty one may breathe a political atmosphere.

The treaty stands directly in the way of the Entente countries in their necessity and effort to get reparation payments. Suppose Germany finally refuses to pay any more, and suppose Russia refuses to pay at all. What then? The Entente may ultimately have to take up arms to get payments. The 800,000 soldiers of France and the much smaller armies of Italy, Belgium, and England could now be confronted, first, by the 100,000 German regulars, plus the hundreds of thousands of trained men who have belonged to the various "security" organizations (but who would be quickly solidified with the German army), and, second, with the 1,500,000 soldiers in the present Russian army.

The treaty is meaningful not to Germany and Russia alone. When the present Poland was created, men prophesied that if Germany and Russia ever came together in close alliance they would crush Poland between them. Neither Germany nor Russia wants Poland to be a separate state. Neither Germany nor Russia is satisfied with present frontiers. The treaty, therefore, doubtless signifies their own expected territorial expansion at a not too distant day, and the fourth and final partition of Poland.

Will the world stand idly by?

The German and Russian journalists here in this "Casa della Stampa," as I write, are boasting that their treaty will consolidate peace. Instead, it may ultimately mean war.

Such is its potentiality. As to the present Conference, however, while the treaty has endangered it, it need not prevent its success. The duty of the

delegates remains the same, no matter what the present defection or the distant menace. It is to make out of the debates and decisions in this Conference

a bridge over which the ruined nations of Europe may walk from shifting sands to the firm ground of an assured prosperity. But I, for one, deem the Russo-

German treaty a bomb placed under the bridge.

Let us hope it won't explode!

Genoa, April 20, 1922.

SEATTLE ELECTS A MAYOR

SPECIAL CORRESPONDENCE

BY WILLIAM CHAPLIN COLLINS

SEATTLE has had another municipal election.

The selection of Dr. Edwin J. Brown, dentist-lawyer, sometime Socialist, for Mayor, Tuesday, May 2, is well in accord with the often-observed fact that political disturbances of the Northwestern metropolis are never dull. The city that recalled its chief executive in 1911, that was the scene of America's first general strike in 1919, has, by its recent Mayoralty campaign, abandoned its old political leaders for new. And it has done so in a way nothing short of extraordinary.

A fusion of the votes of labor, banking, business, and professional groups is believed to be the explanation of Dr. Brown's election.

The new Mayor was bitterly fought by half the newspapers of the city and supported by none.

He has a record of political misadventures as Bryanesque in number as in variety.

Yet, in spite of all, he was chosen by 40,000 votes to his opponent's 28,000.

Dr. Brown presents a peculiar figure in municipal politics, virtually unique. He is both a lawyer and a dentist by profession. His first taste of city politics was in Kansas City, Missouri, where he was graduated from a dental college, and from the Kansas City School of Law in 1899. For a time he was a barber. His real interest was in reform, and was centered in the fight led by William Rockhill Nelson, of the Kansas City "Star," against the city bosses. He shared in the campaign that elected Herbert Hadley to a city office—Hadley, who later became Governor of Missouri and who was mentioned for the Presidency in 1912.

During his twenty-one years of residence in Seattle he has been looked upon by business men as a harmless radical of a rather freak type. He is most widely known as a dentist whose advertisements in the newspapers consisted of political and economic sermons and of occasional tirades against rival dentists who sought to reap the benefit of his publicity by establishing their offices in the vicinity of his, with the announcement that they were the "right Dr. Brown."

Periodically he ran for office, and periodically he was defeated. His political career includes campaigns for Governor, the bench, Mayor, corporation counsel, city councilman, and prosecut-

ing attorney. In earlier campaigns he ran as a Socialist, later as a Non-Partisan, and still later as a Democrat.

His difficulties with the name of Brown were not confined to disputes with rival dentists. In 1918 he lost the race for county prosecuting attorney by a mere handful of votes to another Brown. "Counted out by the gang," declared Dr. Brown.

Admitting he was a "bright fellow," few took him seriously. He supplied political amusement.

That the Bryan of Seattle, an advertising dentist, with a record of radical utterances, should be chosen Mayor of Seattle would not have been credited by astute politicians a month ago. Apparently, indeed, the shift to Brown was astoundingly swift, almost unparalleled. Yet it has its roots in a State-wide distrust of the old political leaders and old political line-ups, distrust that has made many willing to turn almost to any quarter for relief and change.

Interest in Seattle's municipal affairs was aroused in 1911 when the city, in the throes of setting its house in order, recalled its Mayor, the famous Hi Gill. Brown, incidentally, was one of the reform candidates—defeated, of course. But when Gill was later elected again, students of municipal government realized that Seattle offers much that is instructive in the ways of city politics and policies.

Shortly after the armistice attention was focused on Seattle again by the threatened general strike, when Ole Hanson, then Mayor, came into prominence by his determined stand against the strikers.

After the strike failed, Seattle was confronted with the issue of ownership of its street railways. Mayor Hanson strongly advocated the purchase of the system by the city, which was accomplished.

Ugly rumors soon were passing from mouth to mouth concerning the street-car purchase. It was openly charged that the city had been grossly held up, that an antiquated, run-down white elephant was in its keeping.

The result of the Hanson administration was twofold: the street railway became a chief issue in municipal politics, and the breach between labor and business was wider than before.

The street-car purchase became the subject for grand jury investigation, lawsuits, and much agitation, while the

very next Mayoralty campaign was contested between a conservative and a radical candidate. The conservative candidate won by a large majority, in spite of the fact that most of the newspapers, outside the labor press, gave active support to another conservative man.

But the moderates, victorious as they were, saw that, while the labor votes were concentrated on one candidate, the conservative votes were scattered over the field. As a result these men organized this winter the Washington Union League Club, an out-and-out political organization which in the primaries preceding the recent election gave its support to Walter F. Meier, Corporation Counsel.

The internal condition in Seattle was complicated by a condition obtaining throughout the State—disgust with the rings, old line-ups, old leaders, that had been in control of politics many years. Whether dishonesty and crookedness existed, and exists, or not, is difficult to attempt to prove, but the belief that they did exist was not confined to radicals and reformers. The people generally were in the mood for change.

This was a fact overlooked by the Washington Union League Club. The personnel of the founders was peculiarly unfortunate: Richard A. Ballinger, of Ballinger-Pinchot fame, was temporary President, and others who might fairly be judged reactionaries rather than conservatives were associated with him.

Meier was defeated in the primaries, the victim of the unpopularity of his supporters.

Another conservative, State Senator Dan Landon, and, to the amusement of many, Dr. Brown, were the nominees, the latter nosing out Mr. Meier by 32 votes.

The day following the primaries Dan Landon's election was confidently predicted.

Then came the extraordinary and unexpected shift. Seattle, quietly and without explanation, went Brown.

Five days before the final election the impossible began to become possible, nay, probable. Seattle's business men, bankers, professional men, those who had laughed at Brown, were deserting Landon. They deserted a Republican for one whom they never had considered other than a freak, politically speaking. The "grafting plunderbund of business profiteers" and the "red radi-

cals," as extremists in the two groups term each other, were agreeing on a candidate for Mayor.

The "Union Record," labor organ, took alarm, and did not express any opinion. The opponents of Brown became frantic. He was accused of being a radical Socialist: he was denounced as a tool of reactionary business. He was charged as a champion of bootleggers, drug peddlers, gamblers, grafters, big business. "Senator Landon concedes me everything," remarked Brown.

But it was not love for Brown so much as dislike for Landon, or for the things his name was associated with, that elected the doctor. Landon belonged with the old-line politicians. He had long been in State politics. Chief among his supporters were men who, in the public mind at least, were regarded as of the "ring," both in City Hall and State Capitol. And the electorate rebelled.

Another factor, seemingly ridiculous, had much to do with the votes. Landon has been called the "homeliest man in town." With the increase in Seattle's importance as a commercial center, the social aspects of the Mayor's office have broadened, and many sensitive citizens could not bring themselves to support Landon for that very reason. At least, so it is believed.

They looked at Brown; many modified their former opinion. The dentist-lawyer had not been letting grass grow. He is said to have done a business well over the million-dollar mark since he came to Seattle; he owns a ranch estimated to be worth in the neighborhood of \$200,000. Although Brown was waging his usual fight to "clean up the city," the moderates said to themselves that perhaps they had done him an injustice. He might have peculiar ideas, but he was a highly successful man of affairs.

Seattle, emphatically, had determined upon change.

Interest in Dr. Brown will not cease with his election. He has promised lower street-car fares, and his solution of the problem will have great bearing on the whole subject of municipal ownership. Then, too, he is an advocate of a mammoth hydroelectric development project. This, if carried to completion, will, as Dr. Brown says, be "one of the greatest single-handed assets owned by any city in the United States" and "will produce more power than Muscle Shoals."

Meanwhile Seattle is rubbing its eyes, surprised at itself. The "Times" remarks philosophically that Seattle has survived a Hanson and can survive a Brown; others believe the cause of honest government has triumphed over questionable political forces; and the Nation is edified by another example of the idiosyncrasies of municipal politics.

KNOLL PAPERS

BY LYMAN ABBOTT

AN AGE OF SERVICE

THIS age is rightly called a commercial age, and commerce is an interchange of services. There are very few businesses, there is no honest business, in which a man can engage without serving the community. The farmer raises a crop of corn and wheat; he sends it to the mill, which grinds it into meal and flour; the mill sends it to the railway, which transports it to the city; and the railways deliver it to the grocers, who in turn distribute it to the homes. Farmer, mill, railway, and grocer are co-operating in a mutual service on which the community depends for food. It is because this commercial machinery of interchange is interfered with that thousands of Russians are starving, and, although charity, carefully organized, is attempting to supply them with food and is working very efficiently, it cannot, with its utmost effort, take the place and do the work done with comparative ease by commerce.

Precisely because this age is one in which mutuality of service is so fully developed, I call it not only a commercial age, but also of all ages in history the most Christian.

For it is service that distinguishes Christianity from paganism. This is made clear by the only passage, I think, in which Jesus defined the fundamental difference between paganism and Christianity. He said:

Ye know that the princes of the Gentiles exercise dominion over them, and they that are great exercise authority upon them. But it shall not be so among you, but whosoever will be great among you, let him be your

minister; and whosoever will be chief among you, let him be your servant.

The difference between pagans and Christians is not that the pagans call God Jove and the Christians call him Jehovah; nor that the pagans worship him in temples with prayers and sacrifices and the Christians worship him in churches with prayers and music. As I have recently written in one of these "Knoll Papers," a community in which the rich make the poor serve them, and the strong make the weak serve them, and the wise make the ignorant serve them, is pagan; a community in which the rich serve the poor, and the strong serve the weak, and the wise serve the ignorant, is a Christian community.

The difference is theological as well as sociological. The Christian religion is the only one which worships love, not power. The whole of Christian duty is summed up in "A new commandment I give unto you, that ye love one another, as I have loved you." The whole of Christian theology is summed up in the declaration, "God so loved the world that he gave his only begotten Son."

We do not need a new organization of industry. The present organization is admirably adapted to carry on a commerce which is a mutual service. What we need is more of the spirit of service and less of the spirit of acquisition. Co-operation is no cure for selfishness. A well-organized gang of railway robbers is the more dangerous to a community the more efficiently it is organized. A corporation is essentially a co-operative enterprise. A thousand men contribute their money to a fund and

trust the fund to the control of a few supposedly wise directors. The directors serve the stockholders; the stockholders serve the community. Such a corporation may be animated by the spirit of service; but it may be animated purely by the spirit of selfishness. It may have no soul. Soviet Russia has taught one lesson to the world; it has taught us that changing the form of industry and leaving it controlled by the spirit of selfishness is no remedy for industrial ills. Communism is not curative.

It is impossible to estimate the service which has been rendered and is being rendered to the world by the men who have produced—some by their muscles and some by their brain—corn, wheat, wool, coal, iron, steel, copper, lumber, oil, for the world's use. The difference between the America of to-day and the America of five hundred years ago is largely due to the work of these men. Some of them have been overpaid, some of them underpaid. But the quiet assumption of certain reformers that the captains of industry have been actuated only by the ambition of acquisition has no foundation in fact. It can be pardoned only on the ground that ignorance is the mother of uncharitableness. In America the ambition to do a great service is at least as common as the ambition to acquire a great fortune. Oftenest, perhaps, the two go hand in hand.

In America Christianity is paganized, paganism is Christianized. Neither dominates the other; but gradually, very gradually, the spirit of service is taking the lead; Christianity is gaining the mastery.

BEHIND THE SILVER BUTTON

A LETTER TO AN EDITOR OF THE OUTLOOK FROM A CAPTAIN IN THE A. E. F.

DEAR ABBOTT:

You ask me what a magazine like *The Outlook* can do to benefit the disabled service man now in the care of the Government. This is a difficult question to answer—there are so many sides to the problem, and all the human materials with which we have to deal are rather refractory. You must keep in mind that the whole matter is one of the interplay of people with conflicting aims and interests.

Take the ex-soldier himself. I've been through the mill from the bottom. When I enlisted fourteen years ago in a crack Boston outfit, I was so green that it struck me as a good stunt to go and rough-house the officers' tents. Fortunately, an older soldier dissuaded me. From those depths I climbed to the dizzy elevation of a very temporary battalion commander. I took a company of infantry into action in the Argonne Forest, and have had two and a half years in army hospitals to think it over. I'm lame now and a pensioner. While no seer, I know something of the workings of the disabled service man's mind. It's apt to appear to the normal citizen as a warped mind. It is.

To begin with, the disabled soldier is either sick or wounded; by this time he's been sick or wounded about four years; he's a chronic invalid; he's had from one to twenty operations under anæsthetics; he's been shipped from hospital to hospital, examined, quizzed, jawed at, pawed over, by some scores of doctors, most of whom he guesses—and he's not far wrong—aren't capable of properly chloroforming a sick kitten. He accepts the kindly ministrations of the Red Cross and the cockroaches that come on his breakfast tray with the same weary philosophy, as the good and bad elements of the same game. Pain and pus are old and too familiar details of his life.

Naturally, a sick body makes a sick mind. He lost all ambition years ago; he is more or less content to accept his lot, to weave baskets, string beads, shoot craps, and get tanked on bootleg gin after pay day, without much thought of the future. Physical weakness and dependence upon others sap his mental vitality. He is suspicious and grouchy; he is hard boiled. One gets used to a certain amount of pain—it's part of the day's work. Aside from that, the life isn't hard; bed and chow are furnished, and the ghost walks once a month.

Pitchforked out of this life into a strenuous world that forgot about the war by January 1, 1919, the ex-soldier is out o' luck. You know the old story: job gone, nothing offered except at starvation wages, no ambition, and a pain in the old wound when the weather is

damp. Hospital wasn't so bad, after all. Every one he meets is only too glad to do anything for a wounded soldier to get him out of the way. He accumulates recommendations as he is passed from one office to the next. He is asked over and over again what he thinks of the bonus. Then the Veterans' Bureau notifies him that his case has been re-rated and his compensation cut in half. He drifts. If lucky, he lands a job, gathers himself together, and holds it down, but he is always uncertain as to what the Veterans' Bureau will do to him next, and whether or not that old gas cough that comes back on rainy days really is T.B. He is apt to be sore on the Administration, to consider that the wise guy, after all, was the slacker, and to vote the Democratic ticket next election.

Don't judge these little weaknesses too harshly. Remember that four swift years ago that shabby chap with the silver button in his coat was your hero who waded through the poison gas and shell-fire, struggled in the barbed wire, shot or clubbed the gunners at their Maxims, and turned the crackling muzzles back upon the Hun. Remember Belleau Wood, St. Mihiel, and the Argonne. To you they are names and dates recalling weary days and anxious nights; to him they are flaming and terrific realities—memories of slaughter and peril, the dead face of his buddy white and red in the mud, of his own sacrifice and his own blood soaking into the pleasant land of France.

Turn now from the soldier to his guardian enemy, the doctor. The doctor, like his victim, is a very human man. He's not the best doctor in town, and he knows it. Your own physician and the fellows you know who went through Harvard, Johns Hopkins, and P. and S., who have a good practice and do clever operations in clinics for charity, aren't his kind. He never went to a big college; he learned medicine in a struggling, second-rate school. He's looking after soldiers, to tell the truth, because he needs the money. He finds them an obstinate, irritable, dissatisfied lot, ever clamoring for the impossible, always packing a grievance. With these men he does the best he can till he gets tired out, then finishes off the job in a hurry so as to get in a little tennis on the hospital clay court before it rains. He becomes indifferent to pain—it's part of his day's work; he gets indifferent to Croton bugs and dirt. Every army hospital he has been in has an abundance of both. It doesn't matter much; there are always clean bandages and the eternal Dakin solution. Forever there are reports to be made out and record cards to be filed; if he misses out on these, he catches hell from the adju-

tant; if he makes a mistake on a patient, it isn't so easy to stick the blame on him. Red tape and routine treatment of men who won't get well are the bane of his existence. It is difficult to keep up any enthusiasm; he draws his not over-liberal pay check as long as he satisfies his immediate superiors. He has small variety in his practice—the same old dressings on the same old wounds day after day; he may feel himself going stale; like the soldier, he is apt to drift.

Now take the angle of the Veterans' Bureau employee. He—or she—probably landed the job through politics. Times are hard, and if this job is lost it will be next to impossible to get another. The immediate concern is to keep that job. There will always be a roomful of restless, poorly dressed men with canes and crutches, moving about, turning over tattered magazines on the table, smoking cigarettes, and inquiring about lost records. Tell him to come back in a week—the papers are in Washington. Next. By and by the soldier gets tired of being stalled off and goes to his Congressman with a tale of delay, suffering, and mistreatment that is all true but which loses nothing in the telling. The Congressman writes a letter to the Bureau or gets some one on the 'phone. Things happen fast. The employee, with the late dismissals in the Bureau of Engraving and Printing fresh in his mind, digs frantically for the records and X-ray plates; cannot locate them because the office has been moved twice since the soldier's case was first opened, and in despair goes to the politician who landed him the job for his help in keeping it. Ultimately the soldier gets attention. If he were wise, he would have gone to his Congressman in the beginning. As it is, he is convinced that the Veterans' Bureau is full of Bolsheviks who are out to do the soldier. You can't blame him much, either.

Finally, there is the public, and you know more about the public than I.

What can *The Outlook* do to help the disabled soldier? There is need for a large sanity, reasonable kindness, justice, humanity, efficiency. The Government has spent enormous sums of money; it has run away like water spilled on the ground, and the disabled soldier is still discontented. He feels that the United States Government has not lived up to its promises. Mulling over its records, and fearful of its jobs, the Veterans' Bureau cares no more for the men it is supposed to serve than does the mill for the grain it grinds. The soldier finds the vocational training more or less of a sham, but he accepts it for the living wage it carries. Promised retirement on a parity with Regu-

"THE GOD IN THE MACHINE"

By Elsie Singmaster,

for many years a welcome
contributor to The Outlook.

ELSIE SINGMASTER

lar officers, the disabled emergency Army officers have fought the General Staff for three years to get the protection granted emergency Navy and Marine officers, but denied those who led the soldiers in battle.

Consequently we organize. The disabled emergency officers seem to be on the point of winning a grudging and partial fulfillment of the promise made in the Selective Service Act by the passage of the Bursum Bill; the Legion and Veterans of Foreign Wars have jammed through the House a Bonus Bill that is

bitterly fought in the press and in Washington by the people who will be taxed to pay it. What a pity the burden cannot be placed on the men of military age who did not join the Army! The soldier is out to get what he considers his rights; angered by the opposition of those whom he feels sat back and made money while he sweated in cantonment or shivered in the mud of France, he may be inclined to press his claim to the limit.

You see the difficulty of your question—What can The Outlook do for the dis-

abled service man? Attack each problem as it comes up; give us the benefit of your cool, sane, well-balanced, kindly thought. We need it. Help the disabled officer get his retirement; clean the dirt and bugs out of the hospitals; help the patient, the doctor, and the employee in the Veterans' Bureau to a better understanding of each other; fight the exploitation of the crippled soldier; speed up and humanize the system.

I thank you.

Sincerely yours,

RICHARD DOUGLAS.

THE LOGGER AND THE EFFICIENCY EXPERT

BY SHERMAN ROGERS

INDUSTRIAL CORRESPONDENT OF THE OUTLOOK

"WE are industrial experts. We can revolutionize your plant. We make profitable factories out of losing ones. We show you where your men are wasting time. We eliminate waste and install modern methods of increased efficiency. That is our job. Give us a trial."

The busy manager of a large logging concern in the Pacific Northwest received the above mimeographed circular from a brand-new Eastern firm of industrial engineers. The grizzled old logger understood the woods; he had been brought up in the tall timbers of the great Northwest. In his early days he had delivered railway ties to the Great Northern Railroad at twenty cents apiece. He didn't make much money, but still he enjoyed the experience. It at least kept him going. He finally purchased a "coffee" mill and delivered rough lumber to Puget Sound cities. He later purchased a Willamette "donkey" and started logging on a little larger scale. He enlarged his plant as years went by. He was an expert in every

branch of the logging business. He had been a "faller," a "bucker," and a "bull buckler." He went on the "rigging;" started in "choking," then "chasing," "decking," "second loading," and finally became a "head loader." He had fired the logging "loky" and later on became a "donkey puncher," graduating from his woods experience as a "hook tender" of the first quality. He had laid out his own railways, and they were the pride of the country.

Having worked up through every department of the logging game, he thought he understood the logging business to the 'steenth degree. There was no question but what he was familiar with the practical side of steam logging from the stump to the mill pond. However, here was a new angle. He thought it was worth a trial. He decided to give the industrial engineers a chance. To his intense surprise, after he had signed the contract an immaculately tailored young man appeared in the woods.

He had a short talk with the logger.

"I'll investigate for a few days," he finally told him, "and I will probably find out just what the trouble is. When I do, we will proceed to eliminate it."

"Was you ever in the woods before?" queried the logger.

"No," replied the student "expert," "I never have been—but then that makes no difference. We simply apply modern methods; eliminate unnecessary work; standardize production by pointing out the defects of your system. You see, that's our business. We have learned it."

The grizzled logger became dubious. Logging was his game; but, never having enjoyed the advantages of high school or college, he stood in awe when facing the college-developed brain. After a week of walking around the woods in a dignified manner, the engineer took the mill-owner into his confidence.

"Just as I thought," he started. "You're losing a lot of money with your falling crew. A terrible waste. You have twelve crews of 'fallers;' they are losing about one hundred minutes per

(C) Keystone

FELLING A GIANT TREE IN THE NORTHWEST

man per day. You have twenty-four men, which makes a total of twenty-four hundred minutes, or forty hours. Your wages are 50 cents an hour—or taking forty hours' loss of time makes \$20 a day. This makes a total of \$520 a month for a twenty-six-day month, or \$6,240 a year. In eight years you lose \$50,000; in sixteen years, \$100,000. So, you see, this is a terrible waste that can be very easily eliminated. This shows you the value of industrial efficiency. It will give you an insight into what our industrial engineers are doing for the country. This of course is only one department. I have only had an opportunity of studying the 'fallers' and 'buckers.' You have a train crew, a loading crew, and a landing crew, and I don't doubt but that I can find like deficiencies in these departments."

"This is wonderful!" exclaimed the logger. "Wonderful! I have been logging now for a great many years. I am considered to be worth about \$125,000. But here you find a saving in my falling crew alone that would amount to more in twenty years than I am worth. It is certainly marvelous!"

The young "expert" beamed with pride; he could be excused for that—he was only a boy with a long lead pencil, lots of paper, and plenty of time with which to figure.

"You're tired to-night," said the youth; "I won't go into this in detail until to-morrow morning, after the 'roll-out' has been called, when I will go over

the matter fully." Therefore the explanation was left for the morrow.

In the morning, after the crews had left on the logging train for the upper works, the "expert" stepped into the office.

"All right, now," he began; "I'll get down to business and show you what I have discovered. Here are my charts for the week. They tell the whole story. I won't have to talk much. You see, I have watched your 'fallers.' They are wonderful men, with perfect physiques. They go out and undercut the timber. They do a beautiful job—in fact, I have gazed with undisguised admiration at the perfect smoothness of an undercut that has from ten to twelve cubic feet of face. They are marvelous at pulling the saw. They work like Trojans. They drop the timber exactly where it should go. At that they are expert. There has not been a tree dropped across a stump the entire week where there was a possibility of avoiding it. It shows beyond all doubt that these men are doing their best to avoid unnecessary breakage. They do not lose a moment from the time they put in the large duck-bill wedge. They drop the tree with all despatch, and up to this point they are perfect. Now I come to the point where the loss of time takes place. When the tree is dropped, the 'fallers' sit down on the stump, gaze up and down the fallen timber, even smoke a pipe, and then walk leisurely over to the next tree. They sometimes spend several minutes

looking around before they put in their undercut. On a calculation based, as this chart indicates, on the entire week, the loss of time from the moment the tree dropped until they actually began swinging the ax on the new tree—the loss of time averaged ten minutes. You have very big timber here, and my chart indicates that the men have averaged ten trees a day. They have lost ten minutes a tree, which makes a total loss of one hundred minutes per man per day, or, as I explained to you last night, a monthly loss of \$520 on your tree 'fallers' alone. How about it?"

The tanned, weather-beaten-faced logger's hands twitched nervously. They were rough hands; they had big, deep cracks along the edges of the palm. The finger tips had deep cuts in them. The rough fingers slowly tapped the smooth surface of the desk that separated them. The logger's face began to grow red. Anger was plainly visible in his eyes. It could easily be seen that it was hard for him to control his emotions. He quickly arose to his feet and in a thunderous tone shouted: "You poor deluded 'tenderfoot'! What do you mean by coming up here and wasting a week of my time as well as your own? Where did you ever get the nerve to send me your big-worded circular? If you had ever done a real day's manual work in your life, you would know something about men; but that hasn't been part of your schooling.

"Now let me give you a lesson in efficiency. Those falling crews that you have been watching all week are the type of men you say they are—brawny, red-blooded, vigorous men. There is not a slacker in the crew; but they are not machines. You can't oil them up and walk off, like you can a 'donkey' engine. With all their strength, they are only human. That timber is the hardest cutting timber in the world; not because it is so hard; it isn't; but because it is so full of pitch. When these men spend, as you say they do, from thirty-five to forty-five minutes at constant sawing, standing on spring-boards, with every ounce of strength they've got on the saw, common sense ought to tell you that, when they get through with that forty-five minutes' work, which takes more exertion than ten rounds of a real prize-fight, relaxation of some kind is necessary. If these men did not take that ten minutes of rest which they do, they would be entirely played out by noon. The best man in the world would be all shot to pieces in less than a week. That rest they take, instead of making them less 'efficient,' is the thing that makes them so highly efficient. By taking that ten minutes in each hour for relaxation they are able to give me eight hours of solid work. If they did not take that rest, in less than three days I would not be able to get any work out of them at all. Instead of falling ten of these giant trees a day, their average would drop to six, and less. You may be a good theoretical industrial engi-

neer. You may know your business from a technical angle, but, lacking the practical personal contact with the actual laborer, your 'experting' makes your work absolutely valueless; yes, worse than valueless, because you have used up a lot of our valuable time and your report is not worth the snap of your finger.

"Now, son, let me give you some advice. You have a schooling in books and that is one of the greatest assets a young man can have. The trouble with you is you have only half finished your

schooling. Take my advice: If you are going to be a woods industrial engineer, just get on a pair of overalls, some spiked shoes, a wool shirt, and a pair of gloves; start in on the rigging and spend a year or two gaining actual knowledge of conditions. As you work study men, and then you will know something about them. You cannot study men—the hearts of men—from a picture or a story book. You have got to live with them and feel them. You have got to go hungry with them and perspire with them; pack blankets with

them, if it is necessary. Combine that experience with your knowledge gained through a college education, and then you will be worth a big fee. You will not only be a credit to yourself and the school from which you graduated, but you will be of tremendous value to the Nation.

You have made the first right step, young man—the best step a young man can take; but take my advice—complete your education by putting on a pair of overalls and study the greatest factor in industry to-day—the human factor."

BEHIND THE LEVEES

BY FREDERICK W. JONES

LIFE in the Yazoo-Mississippi Delta with the waters of the rising Mississippi washing the top layer of the emergency sand-bags¹ on the levees brings many of the uncertainties and fears of defensive warfare. It suggests both the siege of Vicksburg and the early days of a constantly tightening blockade. Everybody thinks and almost everybody talks in terms of the one great "If." The schoolgirl will have her graduating dress "If." The ball team will play Greenville next Saturday "If." The housewife debates with her family and neighbors the grave question of the wisdom of setting out tomato plants. The planter tries to show his contempt of that "If" by tossing a coin to see whether all hands go fishing or plant a hundred acres of corn. But I notice that one of these planters has this standing order with the merchant he and I deal with: Such and such a number of bushels of corn and such and such a number of tons of hay "if the levee breaks." Every family in the country has equipped itself with at least one boat and has planned what to do with the stock. In the meantime the

churches and the Sunday schools are filling up. Like Noah in the days of the approaching flood, everybody is trying to "walk with God." One preacher in my town has cleverly expressed it all on a signboard: "If the levee of life breaks, have you a lifeboat for eternity?"

Fortunately for the peace of mind of the planters in this section, there has been an abundance of fighting on hand. At the first approach of the besieging enemy a weak sector on the battle-front was found. For a distance of six or seven miles in the region of Miller's Point, about twenty miles north of the rich and beautiful city of Greenville, the levee was regarded by the engineers as insecure. A break there would send the waters of the Mississippi down Deer Creek, which runs for scores of miles through one of the richest parts of the lower Delta. Many hundreds of thousands of acres of highly cultivated plantations would be overflowed; cities and towns would be threatened with disaster; human life would almost surely be lost. Meetings were held in many of the communities along the creek. Organizations were perfected for the purpose of sending labor to strengthen the impaired defenses. Many planters offered to send the last man they had.

They argued that if the levee broke no amount of labor would be worth anything to them.

At first the Negroes were every morning transported in cars and trucks, returning at night. Later special trains were run; camps were laid out, and at times as many as five thousand men put upon the first, which is also the last, line of defense. Wherever darkies are found loafing about a Deer Creek town they are given their choice of going to work on the levee or being arrested for vagrancy. They usually choose the levee work, though to those who live several miles away from the rising river the thought of fighting it is terrifying. After a few hours of association with the seemingly harmless body of water, however, they seem contented enough. Two professional gamblers the other day paid fines of \$100 each and accepted sentences of eight months on the county farm rather than risk their necks or their superior social standing as members of a promiscuous levee gang.

Fighting the Mississippi is not particularly hazardous for those who are on the battle-front. Most of the danger is for those who live away from the levees. Whenever a break occurs, everybody within reach of them runs toward these

¹ Dirt, instead of sand, is used. Sand sifts through the bags. However, the word "sand" is always used instead of "dirt."

UNDERGRADUATES from 125 universities and colleges scattered through thirty-nine States and the Dominion of Canada entered The Outlook's prize contest for the best letters on the problem of modern athletics. The task of selecting the victors was a formidable one, for the letters showed the highest average of merit of those which we have received in any of the Outlook contests conducted during the past year.

The winner of the first prize is at Princeton.

The winner of the second prize attends Ohio State University.

The winner of third prize claims as his Alma Mater Cornell.

The seven fourth prizes have been awarded to undergraduates of the Massachusetts Institute of Technology, Oberlin College, the University of Minnesota, the Iowa State College, the United States Military Academy, the Columbia School of

Journalism, and from a Pennsylvania institution, the name of which we may not disclose.

The names of all the prize winners who have permitted us to make their identity known, together with the first, second, and third prize letters, will be appropriately published in the Recreation Number of The Outlook—that of May 24.

The letters from winners of the fourth prize will appear in later issues of The Outlook.

Photo by J. E. France

BEHIND A THREATENED LEVEE

In the foreground are men engaged in putting sand in sacks. In the upper right, the small figures are men carrying sacks of sand up the levee to load on a barge for transportation to other weak points. About 3,000 men are working to save this point. Some 8,000 men in all have been working day and night on a strip seven miles long. The scene is at Stop's Landing, near Scott, Mississippi.

protecting dikes. When the water pours through the opening, the pressure elsewhere diminishes. The broken wall of earth will at least protect life and limb no matter how great the destruction of property.

The psychology involved in the thought of a break is disheartening, but, for all that, strangely interesting. It reveals one of the sad weaknesses of human nature. After men have fought the river day and night for weeks and it seems stronger than ever, a depression settles over many a desirable citizen that is relieved only by the thought that the fight is raging just as fiercely "on the Arkansas side," perhaps a little more fiercely, and if—Action, we are told in physics, is equaled by reaction. If terror strikes deep into the heart of the people of the Mississippi Delta when news of a break on their side reaches them, some feeling of an opposite nature, call it what you will, sets them singing—figuratively, of course—when the tidings of a breach on the Arkansas side are loudly proclaimed among them. One wide break and, as a rule, the campaign is over. The river and the other side win.

Every week we hear rumors of this order:

"A stick of dynamite was found at Avon."

"A bomb was thrown on the levee near Arkansas City. A guard extinguished it just in time. The man who threw it escaped in a boat, headed for the Mississippi side."

"If the river rises much higher, Greenville will blow up the levee ten or fifteen miles down the river."

I put no faith in any of these rumors, but they add greatly to a street-corner discussion of the river situation.

This year the planters on both sides, with the help of the Government and Levee Board engineers, have put up a magnificent fight. But the river has stayed at a record height so long that there can be no relaxing of mind or body. And the longer the battle rages, the greater the damage in case of defeat. It is getting so late in the season now that it is doubtful if the overflowed lands would be free of water in time to grow a crop. The way the Delta man puts it is: "If we must have a break, let it come right now."

And in case of a break all this vast

amount of emergency work will be a complete loss. Those sand-bags—millions in number—will have to be replaced by permanent additions to the inadequate earthworks.

The struggle between man and one of God's most terrifying forces—the Father of Waters—is grim, but it fascinates. In time of rising water guards patrol the levees day and night. They are ordered to keep off strangers, to shoot to kill, if necessary.

Upon their patrol they keep a sharp lookout for sand boils. These are spots close to the base of the levee that show cracks, out of which muddy water is beginning to boil. Whenever these are found a little levee of sand-bags is thrown round them. The water is allowed to rise to the height of the river and all pressure is removed.

Water is continually seeping through the levees. So long as it is clear there is no danger. The moment it becomes muddy, however, there is danger, and immediate treatment is required. Branches of trees are cut and laid over these weakened places. Sand-bags are then put upon the branches, and the resulting mat securely holds back the water if made in time.

Whenever boils are threatened, stakes marked by white rags are driven in the ground and the guards are constantly on the alert for the first signs of danger. Every now and then a part of a particularly weak levee will "slough off." Such a condition is critical. If it responds at once to treatment, the situation is saved. But if the levee continues to "slough off," the case is hopeless. The levee will break.

Fortunately, the engineers can usually hold back the water for twelve hours. In that time the people living close to the river can reach safety with their

Photo by J. E. France

A LEVEE THAT IS IN GREAT DANGER OF BEING BREACHED

The scene, near Scott, Mississippi, shows the face of the levee sloughing into the river and carrying the breakwater fence with it. The water is about twenty-five feet higher than the farms at the left which may be seen just over the line of men who are working to save the levee and their homes.

E. & A. Photos

THE "FATHER OF WATERS" AFTER HIS BONDS ARE BROKEN

The photograph shows the Mississippi at Poydras, eleven miles south of New Orleans, and records a victory for the river in the recent floods

stock and at least a part of their personal property. The surface of the river at the time of this writing is higher than the tops of the chimneys of the Negro cabins on the near-by plantations. And yet, in spite of this height and the volume of the escaping waters, their progress in any one direction after they have once broken clear of the levee is slow. They spread out in all directions, seeking the lowest places first. In 1913, when the levee broke three miles north of Mayersville, Issaquena County, Mississippi, it took twelve hours for the water to reach the town.

Many high mounds built by the Indians are scattered about the Delta. Dwellings and barns are built upon some. The others are crowded with neighboring stock in time of overflow.

When the breach is made, the river plows a lake, often one hundred feet in depth, filled with water of the deepest blue.

For several weeks transportation is conducted altogether by boats. In Mayersville and other levee towns every family has its skiff in good order in the back yard, all ready for any emergency.

Most of the larger cities and towns on or near the river have a system of protection levees. Greenville has a particularly efficient system. All that is required in case of need to make it watertight is to close with sand-bags the gaps made by the highways leading out of the

city. This the authorities had done at the time of this writing, except for a space on all such highways wide enough to allow one vehicle to pass through.

The people who dwell in the lower part of the Yazoo-Mississippi Delta in time of high stage at Vicksburg care very little whether the levee breaks or not. Their lands are overflowed, anyway. The swollen Mississippi sends great volumes of its waters up through the mouth of the Yazoo. Then is seen the strange sight of that river and all its tributaries flowing up stream. That phenomenon is now in full operation. Hundreds of thousands of acres of land are under water—land that, for the most part, had been planted to cotton and corn. Trains running through this section from Vicksburg use tracks upon a high embankment, but each day they arrive later than on the day before. The water is now well up upon the steps of the coaches. When it reaches the fire-box of the locomotive, all communication with the outside world will cease except by boat.

The Red Cross and the Government are feeding sufferers in this region. This condition of destitution will be widespread if there should be a break in any part of the Delta sections of the lower Mississippi Valley. And the battle will be won by the side that has the greater endurance. If the river remains high on the levees for many more days,

it will surely make a breach. The water will soften the earth until resistance is no longer possible. But if the river soon returns to its normal position the siege will be raised. At best the Delta has only a fighting chance.

As one stands on the top of the levee at such an attractive city as Greenville, watches the terrific flow of the current in midstream, and then looks down upon the busy streets of the peaceful community twenty feet or more below, one cannot help being at least a bit ashamed of one's country. The frail protection against this fearful, sleepless enemy, the makeshift weapons of defense (such as sand-bags and willow branches), the constant danger along these extended levees from the dynamiter! Thoughts of all this come, and then with them the realization that that monster out there, so potential of disaster to a region still prostrate from the effects of the World War, was born hundreds of miles away and nourished and strengthened by nearly all parts of the United States except Mississippi and Louisiana. Surely a Government that can overcome a thousand miles from home the engineering problems of a world-serving canal—problems that baffled the genius of M. de Lesseps—can forever take away from its own people the dread, returning almost every spring, of a flood sent from nearly all the Nation's great watersheds.

SICK DAYS

BY HERBERT S. GORMAN

WE come upon sick days:
The little room
That viewed your endless ways
Is like a tomb.

Lie still and do not move
And hold your breath
And be in life, poor love,
A hint of death.

CLIMBING THE BUSINESS LADDER

AN OPEN LETTER TO GIRLS CONTEMPLATING A BUSINESS CAREER

BY KATE DOUGLAS WIGGIN

WHEN a writer has been a sufficient number of years before the public, he or she attracts correspondence as a magnet attracts iron-filings, so that the daily mail is always regarded with combined repugnance, hope, and suspicion on its appearance at the morning meal.

It may now and then contain tributes of one sort or another (though these are rare), it may proffer requests for autographs, books for bazaars, manuscripts for an immediate opinion, subscriptions for the needy in all the arts; but it is sure to hold appeals for advice on a bewildering variety of subjects, ranging from choice of diets to unhappy marriages.

So when two requests drifted in last week for a message to several hundreds of young men and women studying in business high schools and colleges of the country I read them with calmness, tinged with some surprise that I had been approached on this especial topic.

Speaking dispassionately, I think I am safe in saying that I have less business capacity than any other prose writer of my acquaintance. Still, the subject kept recurring to my mind, and I began thinking just what I should say and just how I should say it were I to agree to the artless proposal of one of these institutions, that I should come and talk to the students and that my railway fare would be paid if necessary.

Accordingly I gradually accumulated a few scattered ideas, based entirely upon the apparent lack of social experience or the manifest indifference to ordinary social usage that I daily encounter in shops, professional and business offices, with clerks, maids, telephone and telegraph operators, and others; and now that I have marshaled them into line it appears to me that they

may be of some service to the young persons who have so innocently counted on my superior knowledge.

Were I forced into a business career myself (I certainly should never be invited!), these, I think, would be the articles of my creed:

First, I would cultivate good English speech, at any or all hazards, as a subject of paramount importance. The needs of business are best met by a liberal education. If you have not had it, no one can prevent your getting it in off hours. There is something called, probably for the sake of convenience, "Commercial English." I may be making myself disliked as well as misunderstood, but I protest that there is only one sort of good English. I know that there are certain "forms" to be followed in business correspondence, and am thankful that one need not, at least, begin letters to husbands, lovers, and friends, "Yours of the 15th at hand and contents noted." But all forms are capable of slight differentiation, and you will find some time that the members of a firm say, for instance, "Miss X writes an uncommonly good letter." What does that mean? Something more, certainly, than that she always follows a stereotyped form, whatever the occasion. Miss X, in learning how to write, probably first learned how and what to read. Perhaps Miss X knew the difference between literature and "reading matter" before she thought of a business career. Miss X may have had a vision of "style," and when in some crisis she was given a free hand by her superior officer may have used it in transmitting his messages and wishes, his thanks, or even his downright anger in being asked to do, or agree to, something or other. Business men undoubtedly exist who think that any statement of facts or conditions, however ex-

pressed, phrased, spelled, or punctuated, will serve, but I beg those of you who may soon be in supernumerary positions or in those of considerable responsibility to remember that the command of language is always a source of efficiency and power. Know as much as possible of mathematics, physiology, history, geography, or what not, as your position demands or your desire for general information dictates, but know how to speak and write *delightfully* (I refuse to limit you to the word "correctly") and you will never be unemployed or poorly paid.

Second, I would cultivate good manners. They cost next to nothing and anybody can acquire them—at least almost anybody. It is unfortunately true that manners refuse to grow on some people. Not all plants bloom; some run to foliage. If I couldn't be a "blooming plant" (the word in this connection means to me grace and distinction), I would try for "foliage." That would emphasize many things; for example, proper deference to elders and superiors. I use the word advisedly—superiors do exist, and it is discreet to recognize them when you see them; I think we are all a little near-sighted in this matter in America. It would include also patience and teachableness, adopting a happy attitude towards work, and a tendency to smile when saying, "Certainly," instead of remarking, "All right," and banging the door.

I should not chew gum (pardon the unpleasant suggestion!), no matter how much it added to the joy of life or the relief of boredom. If any one chances to ask what relation exists between gum-chewing and good manners, I will answer at once, "None at all," and leave the questioner to reach his own conclusions as to my meaning.

All these highly informal suggestions

include, it is true, only the dullest of the virtues, to be cultivated by fasting and prayer; they count most decidedly, but, after all, they do not embrace the asset of assets, a certain something we call "charm."

I do not say that this can be acquired, for undoubtedly charmers are born, not made, and when one makes a heroic effort to be charming it results in miserable failure. Self-forgetfulness, rather than self-consciousness, begets charm. Do not make the mistake of believing that it is born wholly of physical beauty or magnetism. Positive ugliness is quite capable of revealing it. Good speech, sincerity, gracious manners (natural, not artificial), all these combined, are a fair substitute for that mysterious quality that the fairies sometimes bring to the cradle of the newborn child. I don't know why this particular Charm Fairy is so negligent in her attendance at birthday parties, but that she is both indolent and indifferent is a deplorable fact. She is unprejudiced, however, for the cradles of employers are not visited by her any more regularly than those of employees. I am inclined to think, when all is said on this subject, that the old Negro was right when he prayed, "Lord, let me so fib dat when I die I may hab manners!" and when in pessimistic mood I am disposed to the conviction that only death will bring manners to some people.

Third, we must add *tact* to good speech and good manners, and analyze it sufficiently to realize that it need not mean flattery, hypocrisy, or evasion of the truth. One can be upright, honorable, and sincere, as well as tactful, if one is sufficiently intelligent to manage the combination. There is never any need of calling attention, for instance,

to a person's lack of hair if he or she has nice eyes and a good nose. Telling the whole truth means to many people a desire to be particularly disagreeable. Too wide a reputation for "frankness" often calls up a picture of a man or woman heartily disliked and consistently avoided. I am speaking of social tact, but if it is exercised in one sphere of life it is likely to be exercised in all.

Fourth, I should be ambitious to achieve all possible knowledge in my especial line; but in conveying it to my customers, clients, or patrons, and, for that matter, to my friends, I should endeavor to avoid arrogance, vanity, and undue self-complacency. There is a very delicate point involved here, although no thick-skinned person ever feels it. There is an astonishing amount of (recently acquired) information delivered in a pedantic, platform sort of manner to persons who were instructed before you were born. Assume that your audience knows as much as you do until it eagerly cries for more light on the particular subject. Do not tell anybody when America was discovered, or the Civil War was fought, or when Shakespeare was born, but recall the dates to the memory very casually in passing. I find myself constantly referring to social usages and forgetting business; but are not the faculties we cultivate in one sphere quite as effective in another? In business we are dealing with human beings, after all.

There are people in the world who can convince you and win your confidence in three minutes by voice, speech, manner, and by putting a case simply, effectively, modestly, yet with an evidently complete knowledge of the subject. I allow that this is magnetism, or genius, or

something resembling both; but there is no use in aiming at a blackberry bush when there are the trees for a target, to say nothing of the stars.

Fifth, I should certainly strive for success, but success might not necessarily mean an enormous income.

It would mean saying quietly to yourself (not shouting it from the housetops): "I will not be a 'second' or 'third rater' in my own opinion or that of others, if I can help it. Perseverance and industry accompanied by a great desire will carry me somewhere near the top of the ladder, even if I never reach those last rounds which are mostly occupied by geniuses."

All the work of the world is not done by geniuses. Some of it is achieved by talent, persistence, courage, patience, fidelity, and endurance; and scarcely any of it can be traced to "luck." Very likely there is such a thing as luck, but it begins before one's birth, perhaps before the birth of one's grandfather. At any rate, we must not count upon it; indeed, we must discount it from the beginning. Believe from the very start that it will never be from the outside, but from within, that success, achievement, and happiness will come. Make the weak points strong, of course; try to find your real vocation in which you can work joyfully as well as usefully. Do not imitate anybody, however admirable. The world does not need "copies"—men and women covered with rubber stamps; it needs *you*, the real you, with all there is in you! If you go deep enough, you are always likely to find unsuspected "stuff" that belongs exclusively to you, modest as it may be. This is your birthright, and the best of it is that it grows, instead of diminishing, by use.

PALIMPSEST

BY BERNICE LESBIA KENYON

Is it not strange to think that you alone
 Could clear the page—renew the luster—find
 Under the obvious, the long unknown
 And secret perfect writings of the mind?
 Thus in an idle hour you can erase
 All blacker words, set broadly to obscure
 What lies beneath, whose substance has no place
 Among new ways that will not long endure.

I wonder, when you read the script aright,
 Untwist the intricate and complex theme
 To make it clear before your inner sight,
 If you will stand inscrutably; and dream
 (Vaguely perhaps, the thought unformed, unsaid)
 How it were better if you had not read?

THE GREENHORN WITHIN OUR GATES

BY NATALIE DE BOGORY

IN a small house that was identical with hundreds of other small houses in a New Jersey town there lived two Polish families, Zielinski and Dombrowski, the first of which boasted a fair regiment of small children. The other couple had not been married long.

There were two bedrooms upstairs; in one slept the Zielinski brood, in the other the Dombrowskis. The parlor and kitchen downstairs were shared. The only heat in the house came from a kitchen stove, and the only washing facility was the kitchen sink. And it was winter and very, very cold.

Into this nest of concentrated domesticity I arrived late one night, dressed in the garb of an immigrant, apparently straight from the "old country." This was the first stage in a white slave investigation that I had been asked to undertake by a committee of prominent citizens in this town. Two Polish girls had gone astray, and it was my mission to find out how that had happened. I was to seek employment in a local cigar factory, to which most immigrants drifted, and, as my best introduction would come from some local immigrant family, the address of the Zielinskis had been obtained.

A member of the committee made a discreet visit to the family to make certain that the living conditions would not be too intolerable, and then I acted on my knowledge of immigrant psychology. Passing through Ellis Island via the Commissioner's Office, I sent a telegram to the Zielinskis announcing my arrival, and, though they had never heard of me, Messrs. Zielinski and Dombrowski went to the station at midnight to meet me.

There was intense excitement in the little house at the arrival of a "greenhorn," and my rather weak "story" was never doubted: I was taken into the bosom of the families.

"Go to bed with us," said Mrs. Zielinski after I had repeated my carefully rehearsed life history for the third time; "to-morrow we'll fix you up."

Exhausted by the journey and the excitement, I was glad to lie down on the cot Mrs. Zielinski prepared for me in the family bedroom, and, since nobody undressed, propriety was duly observed. But the night was not a restful one. The four children snored in four different keys, since all had colds, and the parents also snored, and my body rebelled at the clothing I wore. And the stuffiness of that room! The air seemed too thick to enter my lungs, and I gasped through the night in a semi-wakeful condition, tired and yet anxious for morning.

It was still dark when Zielinski and Dombrowski *pères* went to work; the children were also despatched to school, and finally Mrs. Zielinski turned her critical eye on me.

"You're in America now," were her first words as she surveyed my pale-green dress with its three pathetic frills around the bottom; "you must be properly dressed. We'll get you a suit."

She wanted to be kind, and she stirred nervously a warm fluid christened "coffee" before breaking the whole truth to me.

"That coat of yours won't do," and she glanced at my good woolen coat with its thick cotton padding, "and we'll get you some nice American shoes."

Thus were my soft Russian shoes, good for either foot, with brass tips to the laces, condemned.

I was being Americanized, and meekly I followed Mrs. Zielinski. My coat was apparently so disgraceful that to prevent its being seen in the street again she lent me her big shawl. But as we walked to the store along the wind-swept street I shivered and secretly wished for the coat made as a protection against the Russian winter. It was my first step towards becoming an American.

We shopped in one of those stores that carry everything from wedding gowns to cosmetics and jewelry, where everything is expensive and worthless. Mrs. Zielinski bargained. A black-serge suit was finally bought for \$7. After a bitter struggle, which I won only by a plea of low funds, I retained my Russian shoes; there is a limit to Americanization, and mine was cheap American shoes. Finally my outfit was complete.

At lunch time the children rushed in from school, and I got my first English lesson.

"Patetos." Johnny repeated vigorously, pointing at the dish of boiled potatoes over which lard had been spread plentifully.

That was another source of discomfort to me—the food. I could not swallow the lard, which was apparently the American substitute for that most delectable titbit of the Slavs, salted pig fat. But what a difference!

That afternoon I slipped out, ostensibly for a walk, and kept my appointment with the committee woman, who was to act as liaison officer between me and the world.

"I'm starving!" were my first words. "Please bring me some sandwiches and fruit. I'll live on that until some better means of feeding can be devised."

That evening the families planned my fate. I was to go to work in the cigar factory, and cousin Annie, who worked there, was to take me. Without any effort on my part, the plan was working out as we wanted it.

"All greenhorns work there," Mr. Zielinski explained to me. "You're now in America; and must make money."

I was permitted to rest another day, during which I had a good meal of sand-

wiches and fruit in place of the indispensable "patetos," and on the third day after my arrival cousin Annie called for me at 6:30 A.M. on the way to the cigar factory.

I was entered automatically; I was not expected to know anything; no questions were asked. Within ten minutes I was put at a cigar machine and a Jewish foreman started teaching me to roll cigars, using a dozen Polish words he had learned for the occasion. There were five or six other greenhorns with me—great big, thick, apple-faced Slavs (Poles and Slovaks), all shiny in their new American clothes.

"Look at the other girls," said Annie to me at lunch; "they have ribbons in their hair. You must do the same."

So I bought some ribbon, and made two bunches of bows and pinned them on my head.

I was a full-fledged American.

My subsequent efforts during this investigation were directed towards the evasion of further Americanization; it was too uncomfortable. Fortunately, the attempts did not go beyond my clothes, food, and work.

In two weeks' time my nose started bleeding from the fine tobacco dust. The apple-faced country girls naturally stood the strain better than I did. But it was noticeable that those who had worked for any length of time were pale and pasty-faced. Annie used rouge plentifully on Sundays to overcome this; but, as she earned as much as \$15 a week, she was considered a success.

I do not know what America had to give beyond what I got. Judging by the girls at the factory, none received more than I had. It was cheap clothes and work from seven in the morning until six at night, congestion in the homes, and fearful food. And I was paid \$3.50 per week while learning. In three weeks I was put on piece-work and my wages dropped even lower, but, as I left about this time, I do not know how long it would have taken me to work up to a living wage. Incidentally, the investigation disclosed no organized evil; just a few girls transgressing against the accepted laws of society.

On Sundays there was church and an occasional ball, where most of the girls and boys lined up shyly along the walls, as far from each other as space permitted. Of course Americanization finally overcame this diffidence and "Americans" danced the shimmy without any formal introductions.

And my case was typical of thousands of others and in no way exceptional.

I can feel the rising anger of my readers at this picture of what America gives. I remember my own indignation, and also my attempt to change conditions. My efforts were directed toward organizing evening schools for the teach-

ing of English to "greenhorns;" Slavs received my special attention.

There was a colony of Russians living in New York, in the Fortieth Streets near Tenth Avenue; the girls worked in a neighboring candy factory, so their evenings were free. I induced half a dozen of them to attend school, made arrangements about a location, and, finally, on the opening night came around for the girls, who were to assemble in the home of one of the group. I had already discovered that girls would not go to school of their own accord, but had to be taken there until the habit formed.

"All ready," I announced, entering the tenement room, crowded with men and girls.

A spirit of hilarity reigned, and I sensed a change of spirit.

"Well—I'll go," hesitated Marussia, a brown-eyed immigrant.

"A grown-up girl go to school!" came the chorus from the assembled young men.

Marussia colored violently. These young men meant a great deal to her. It was public opinion, and she could not ignore it.

A discussion started, and it developed that those assembled saw no advantages in learning English, and especially in reading and writing.

"They'll learn what's necessary in the factory," announced the oldest "American" in the room.

My school never materialized.

With the Poles and Slovaks my difficulties were of another nature; they usually worked as servants, and could not get off evenings. Tackling the employers did not help much, so finally I built up some classes among girls who had been here long enough to be promoted into the dishwashing class—which meant free evenings.

An Italian friend had a different experience with her Italian charges; it was neither public opinion nor working conditions—it was mothers who opposed her efforts. Few Italian girls come to distant relatives, as do the Slavs; most of them come to their parents. The Italian mother is wise; she allows her daughter no freedom, permits her no evening pleasures unless she is also present as duenna, and watches her on the streets.

My friend had to win the confidence of the mothers and take her pupils to and from the school. Gradually the mothers became used to the idea and the girls were permitted to travel together.

And yet how glibly Americanization enthusiasts discuss that much over-worked term; they think it is sufficient to hang out the shingle, "Free Evening School, Come In," and the line will form around the block. It takes experience or a European background to realize that the peasant immigrant is happy in his ignorance. In fact, he despises education.

A friend of mine had idealistic dreams of educating his workers only it was

NATALIE DE BOGORY (RIGHT) WITH AN IMMIGRANT FRIEND

A tintype taken by a street photographer while Miss de Bogory was learning her American ropes

not called Americanization, because the mines he owned were in the Carpathian Mountains. The people were ignorant, and he decided that they ought to learn to read and write, and, being a man of advanced thought, he opened the school both for men and women.

He rented a room and heated it. He hired a teacher and sent enthusiasts to advertise the school.

The opening night a few women turned up with children. They sat around gossiping, unrestrainedly nursing their babies; it was an improvement to exchange the news of the day in this nice, warm room.

No lesson was possible. So my friend decided that he would have to make a special appeal to the men. Very little investigation disclosed the fact that the men spent their evenings in the inns, drinking.

Being a practical enthusiast, my friend bought a barrel of the favorite brand and had that delivered to the school. The attendance that evening was encouraging. The lesson started. But soon one man slipped out into the hall, where the barrel stood. Another followed, and before the hour had passed the entire class was exchanging

merry jests outside the schoolroom. Those crude peasants did not even have the politeness to pretend a love of learning.

The school was closed.

It is this lack of understanding of the European peasant which rouses my opposition to most Americanization schemes. If wearing store clothes and working in a factory is "Americanism," it would be an easy task. But to me "Americanization" is just a synonym for "civilization," and it takes more than a few evenings a week in evening school to inculcate the elements of humanness. Did the Zielinskis care anything about my welfare? No. They saw board money in me. That was all. For when I drifted away and disappeared they started no search. And yet they had been in America ten years and their children were "Americans."

It takes more than one generation to develop imagination and sensitiveness, and, without these, projection outside one's ego is impossible. And it takes more than just attendance at evening school to get the impetus towards something higher, towards that which, to me, is included in the word "Americanization."

PADRAIC COLUM, POET AND PLAYWRIGHT

BY LLOYD R. MORRIS

SOME years ago, in writing about Padraic Colum's verse, I said that he is just as surely the poet of the future as Yeats is the poet of the past in Ireland. The suggested comparison is one which Mr. Colum, with characteristic modesty, would be the first to repudiate, yet the publication of each successive book from his pen lends additional force to the conclusion. He is primarily a poet, and poetry to him is so unconsciously an invariable and natural function of life that its special insight is what chiefly informs the whole range of his writing.

The range of his art is both extensive and various; verse, the drama, the retelling of Greek and Norse and Gaelic legend, prose fiction, and the criticism of literature are the forms in which his dedication to a passionate and sustained mood of beauty has been accomplished. In this procession of the spirit his new *Anthology of Irish poetry*¹ takes definite place. It is an exceptionally important book because it is the first to reveal the distinctively racial moods of the Irish spirit through the themes of racial life and tradition which Irish literature has illuminated. In doing this it offers us both a picture of racial experience and an interpretation of its quality and significance, and the value of such ministration to readers who have been moved by the unique magic that is in modern Irish literature can scarcely be overestimated. It is a book to be treasured and loved by readers familiar with Irish literature; but it should appeal even more profoundly to those whose acquaintance is less intimate. Not to have shared deeply in this poetic experience is to have ignored access to a rare and noble beauty.

"Irish poetry," says Mr. Colum in the introductory essay to his *Anthology*, "begins with a dedication—a dedication of the race to the land." He is thinking here of the myth of the Milesian invasion, and of the symbolic gesture of Amergin, the poet, who invoked the land before the first ship touched its shore. To many of us this gesture of invocation is more profoundly immanent in the verse of Padraic Colum than in that of any other contemporary Irish poet. I have spoken of his dedication to a mood of beauty; more exactly, it is a dedication to the land, and the beauty lies in its superb ecstasy, its passion, its lyric loveliness. When, in 1904, A. E. made his now famous anthology of verse by the younger generation of Irish writers, he chose as the opening poem in the volume a portrait of "A Poor Scholar of the 'Forties," by Mr. Colum, then a youth of twenty-three. It was a poem

which made literary history in Dublin; indeed, the latest chronicler of the memoirs of the renaissance has told in his book how W. B. Yeats went about enthusiastically quoting its lines. More importantly, it sounded the note of dedication which recurs in all of Mr. Colum's earlier poems, though with a peculiar wistfulness, as the reader may discover:

My eyelids red and heavy are
With bending o'er the smoldering
peat.

I know the Æneid now by heart,
My Virgil read in cold and heat,
In loneliness and hunger smart.

And I know Homer, too, I ween,
As Munster poets know Oisín.

And I must walk this road that winds
'Twixt bog and bog, while east there
lies

A city with its men and books,
With treasures open to the wise,
Heart-words from equals, comrade-
looks;

Down here they have but tale and
song,

They talk Repeal the whole night
long.

"You teach Greek verbs and Latin
nouns,"

The dreamer of Young Ireland said,
"You do not hear the muffled call,
The sword being forged, the far-off
tread

Of hosts to meet as Gael and Gall²—
What good to us your wisdom
store,

Your Latin verse, your Grecian
lore?"

And what to me is Gael or Gall?
Less than the Latin or the Greek—
I teach these by the dim rush-light
In smoky cabins night and week.

But what avail my teaching slight?
Years hence, in rustic speech, a
phrase,

As in wild earth a Grecian vase!

Mr. Colum continued writing verse, but it was not until 1907 that he collected some of his poems into a little volume which took its title, "Wild Earth," from the last line of the poem quoted above. It indicates his sensitive and fastidious self-criticism that the first edition of "Wild Earth" contains but twenty-five poems. But in those twenty-five poems are to be found the most exquisite beauty revealed by any Irish poet since the very early poems of W. B. Yeats.

"Wild Earth" sums up Mr. Colum's dedication; it deals with the land and with the life of the Irish peasantry, and it does so with an objective vision and a sense of reality unequaled by any other Irish writer of this generation. There is a curious suggestion in these

¹ *Anthology of Irish Verse*. Edited with an Introduction by Padraic Colum. Boni & Liveright, New York. \$3.

² "Gall," Mr. Colum tells us, is the equivalent of the Grecian *βάρβαροι*. It includes all who are not Gaels.—The Editors.

poems of the Gaelic way of thought and the color and cadence of Gaelic speech. There is the vivid, unsophisticated imagery, the vigorous delight in adventure, in nature, in physical beauty, which are so characteristic of Gaelic folk poetry. And in them one finds a caressing rhythm, a singing, lyrical magic natively Irish, to be sure, but quite unique with Mr. Colum's verse. Here, for example, is his poem about "A Drover:"

To Meath of the pastures
From wet hills by the sea
Through Leitrim and Longford
Go my cattle and me.

I hear in the darkness
Their slipping and breathing—
I name them the by-ways
They're to pass without heeding;

Then the wet, winding roads,
Brown bogs with black water
And my thoughts on white ships
And the King o' Spain's daughter.

O! farmer, strong farmer!
You can spend at the fair;
But your face you must turn
To your crops and your care.

And soldiers—red soldiers!
You've seen many lands;
But you walk two by two
And by captain's commands.

O! the smell of the beasts,
The wet wind in the morn;
And the proud and hard earth
Never broken for corn;

And the crowds at the fair,
The herds loosened and blind,
Loud words and dark faces
And the wild blood behind.

(O! strong men, with your best
I would strive breast to breast,
I could quiet your herds
With my words, with my words.)

I will bring you, my kine,
Where there's grass to the knee;
But you'll think of scant croppings
Harsh with salt of the sea.

Mr. Colum's specific contribution to the poetry of the Irish renaissance is notable; he is the only poet who has written of the peasant by building his art from the inside. He has brought into literature the distinctively racial element in contemporary Irish experience, for it is the country people of whom he writes that are the inheritors and the continuators of the purely racial tradition. The memory dwells willingly on the simple, naïve, and natural beauty of his poems, on their sensitive perception, the romantic, passionate symbolization of the land that is in them, on their celebration of the magic and wonder and adventure of familiar daily life.

Before Mr. Colum's verse had become widely known he had already achieved a considerable reputation as a dramatist. By 1902 he had written and published two plays, one of which, "The Saxon Shillin'," was produced with

great success during the following year. That year likewise saw the production by the Irish National Theater Company, of which he was one of the founders, of his play "Broken Soil." It is a curious coincidence that three playwrights destined to establish what have subsequently proved to be the enduring traditions of the Irish drama—Padraic Colum, Lady Gregory, and J. M. Synge—should have received their initial productions within a few weeks of each other. Of the dozen plays which Mr. Colum wrote before coming to the United States eight years ago, only "The Land," "The Fiddler's House," "Thomas Muskerry," "The Miracle of the Corn" (an exquisitely poetic dream play in one act), and a vividly colored Eastern fable entitled in the Irish edition "The Desert," and in the American "Mogu the Wanderer," have been published in book form.

The tradition in contemporary Irish drama inaugurated by Padraic Colum's plays is that of the realistic study of peasant life. In fact, it is the example of his plays, rather than those of Synge, which has furnished a method and a technique to later playwrights like Lennox Robinson and St. John Ervine. "The Land," "The Fiddler's House," and "Thomas Muskerry" are powerful and veritable pictures of life in the Irish Midlands. At one time, Mr. Colum has told us, he contemplated writing a series of plays which together would form a *comédie humaine* of Irish life through all the social stages, and the triad of plays just mentioned partly fulfills that ambition. In them he has created three characters who stand as primary types: Murtagh Cosgar, the peasant; Conn Hourican, the artist; and Thomas Muskerry, the petty official. His first interest as a dramatist is, however, neither character nor atmosphere, but situation. "The dramatist," he tells us in the prefatory note to one of his plays, "is concerned not primarily with the creation of character, but with the creation of situations. For character conceived as a psychological synthesis he has only a secondary concern. His main effort is always towards the creation of situations that will produce a powerful impression on an audience, for it is situation that makes the strongest appeal to our sympathies." In the three plays of contemporary Irish life the central situation arises from the life of the family, into which the characters have put their spiritual and physical energy. But in the effort to regain an independent existence, to control individually their own experience, each of the characters is confronted by another with a conflicting purpose. In "Thomas Muskerry," an ironic tragedy that seems almost a "King Lear" of Irish village life, it is the happiness of the grandfather that is sacrificed to the selfishness of the younger generation; in "The Land" it is the vigorous and trained younger generation which deserts the bleak toil of the hardly won farm for the bright lure of America, leaving the soil to the witless and inefficient; in

PADRAIC COLUM

"The Fiddler's House" it is the father, with the artist's temperament and a deep-rooted impatience of domesticity, who destroys the home and happiness of his elder daughter. To that extent the plays have a common theme. But the life of the family, although it sets the terms of the situation, is not the sole motivating cause of action in the plays. Love of the land, love for the free life of a wanderer on the roads, the rebellion of youth against tradition and the grim dominion of hardship, love of woman, these are the factors which determine and modify the experience that Mr. Colum reveals in his plays. In these plays he has given us the first realistic drama in the contemporary English-speaking theater. It is not the adventurous realism of Pinero or the photographic realism of American play-

wrights. It is a realism which derives its power to move us from a profound faithfulness not only to the outward reality of circumstance but to the inward reality of the spirit. And in that quality are demonstrated the clarity and the depth of his poetic insight.

Since Mr. Colum's arrival in the United States some years ago he has written eight volumes in which he has retold the cycle of Odysseus and that of the Argonauts, the myths of the Children of Odin, the legend of Cinderella, a number of the most beautiful of the Gaelic legends and other charming folk tales. Ostensibly the eight books are written for children, but it is something other than the eternal child that is in all of us or the enduring, eager youth that is in Mr. Colum which explains the spell of these books upon the minds of adult readers. It is, I think, the poetry of his versions of these tales, the unsophisticated attitude of wonder, the joyous ecstasy in beauty, that are equally implicit in his verse.

What perhaps is most important in Mr. Colum's art, its essentially dynamic quality, is fundamentally characteristic of the man's spirit. His accomplished work, the early verse, the plays, the legends, and the critical writing represent a vital contribution to contemporary literature. But the promise of his future writing is even greater than what he has already accomplished; in power and significance his art is conquering new dominions. The volume of recent poems which is soon to be forthcoming and a volume of fiction will reveal the familiar magic and the grave beauty which he has taught us to expect, but they will bring us likewise a loveliness and a power that are new.

THE NEW BOOKS

HISTORY AND POLITICAL ECONOMY INCOME IN THE UNITED STATES (THE).

By the Staff of the National Bureau of Economic Research, Incorporated: Wesley C. Mitchell, Willford I. King, Frederick R. Macaulay, Oswald W. Knauth. Harcourt, Brace & Co., New York. \$1.50.

This is a valuable volume, especially in this day of particular searchings of statistics by the average man. For the Government's new budget system has developed more interest than ever in such questions as these:

What is the size of our National income?

What is the size of our per capita income?

Is not our per capita income larger than that of any other country?

Was not most of the increase in our National income during the war due to the rise of prices?

Did not our participation in the war diminish somewhat the inequality in the distribution of American incomes?

The evident aim of the authors of this volume is to aid those who would determine the adequacy of our production to meet our living needs. The size of the surplus over the minimum amount necessary to support life is given particular attention in this book; it is from

this surplus that our taxes, investments, and higher standards of life are drawn.

RELIGION AND PHILOSOPHY

IN HIS IMAGE. By William Jennings Bryan. The Fleming H. Revell Company, New York. \$1.75.

This book is divided into two nearly equal parts: the first four lectures are controversial theology, the last five are lay sermons. Controversial theology at its best is not of much value; the controversialist is more anxious to win a victory than to expound the truth, and generally neither understands nor interprets his opponent correctly. Mr. Bryan lacks definition. He glorifies faith without telling us what he means by faith, insists that the Bible is "the very Word of God" without defining "Word of God," and urges the divinity of Christ in apparent ignorance of the widely different meanings which have been attached to that phrase. He treats evolution and Darwinism as synonyms; avers that "as a rule, however, the so-called higher critic is a man without spiritual vision," in ignorance of the fact that such men as Phillips Brooks, Henry Ward Beecher, and George Adam Smith accepted and employed in their

ministry the results of the so-called "higher criticism;" and affirms that "the Bible is either the work of God or the work of man," while his Bible tells him in explicit language that it is the work of both. The other five lectures are not controversial. They are really directed to a ministry to "the Larger Life." These lay sermons exemplify his belief that one may have both a good heart and a trained mind, but, if compelled to choose between the two, the good heart should be the choice; and in them he makes good use of his power of popular expression in urging on his hearers the advantage of Christ's leadership in the "Larger Life," the "Value of the Soul," the importance of education, and some of the secrets of success in the use of "The Spoken Word"—that is, oratory.

RABBONI. By Anthony C. Deane. The George H. Doran Company, New York.

"Rabboni" is a clear and fairly comprehensive analysis of Christ's teaching. It is by a clergyman of the Church of England and in its main points conforms to the doctrinal views of that Church, but it is remarkably free from scholastic theology and wholly free from controversy. We do not think that such theological terms as Trinity, Atonement, Vicarious Sacrifice, Regeneration, Apostolic Succession, anywhere occur in its pages. It is the result of careful and intelligent first-hand study and contains some suggestive and illuminating hints. But it is not characterized by any remarkable freshness or originality of thought. It would be useful but not exceptionally appealing to the lay reader.

They Fight Film—
They who have pretty teeth

Note how many pretty teeth are seen everywhere today. Millions are using a new method of teeth cleaning. They remove the dingy film. The same results will come to you if you make this ten-day test.

Why teeth are cloudy

Your teeth are coated with a viscous film. It clings to teeth, gets between the teeth and stays. Film absorbs stains, then it often forms the basis of thin, dingy coats. Tartar is based on film.

Old brushing methods do not effectively combat it. So most teeth are discolored more or less.

Thus film destroys tooth beauty. It also causes most tooth troubles. It holds food substance which ferments and forms acid. It holds the acid in contact with the teeth to cause decay.

Germs breed by millions in it. They, with tartar, are the chief cause of pyorrhea, now so alarmingly common.

Now a daily remover

Dental science, after long research, has found two ways to combat film. Authorities have proved their efficiency. Now

leading dentists, nearly all the world over, are urging their daily use.

A new-type tooth paste has been created to comply with modern requirements. These two film combatants are embodied in it. The name of that tooth paste is Pepsodent.

Its unique effects

Pepsodent, with every use, attacks the film on teeth.

It also multiplies the starch digestant in the saliva. That to digest the starch deposits which may cling to teeth and form acids.

It multiplies the alkalinity of the saliva. That is Nature's neutralizer for the acids which cause decay.

In these three ways it fights the enemies of teeth as nothing else has done.

One week will show

Watch these effects for a few days. Send the coupon for a 10-Day Tube. Note how clean the teeth feel after using. Mark the absence of the viscous film. See how teeth whiten as the film-coats disappear. Enjoy the refreshing after-effects.

Do this to learn what millions know—the way to whiter, cleaner, safer teeth. Cut out the coupon now.

VERY NICE FOR HAROLD T. PULSIFER, THE EDITOR, BUT SORT OF HARD ON HAROLD T. PULSIFER, THE POET

I

DEAR MR. PULSIFER:
I have read your article on "Poets" in the April 26 Outlook.

I should think an editor would want to set the dog on a poet or throw him downstairs. Q.—Why do poets wear long hair? A.—Because they have not the price of a hair-cut. They live in a garret on account of a depleted purse; look thin and skinny because of a slim diet. Their average composition is worth about 30 cents.

C. G. ARNOLD.

1845 Lincoln Avenue,
Chicago, Illinois.

P. S.—I wish you would publish the above.

[Not every one who asks us to print a letter can be accommodated. But brevity helps, as in the present case.—THE EDITORS.]

II

AFTER reading Mr. Pulsifer's article on "How Not to Approach an Editor With a Poem," another poet attempted to dodge his vigilant eye by sending his work direct to Dr. Abbott. The verse, however, landed on Mr. Pulsifer's desk and suffered the sad fate of rejection. A postscript to the tragic adventure appeared in the form of an illuminated manuscript which we reproduce below. We regret that it cannot be presented in all the glory of the original color scheme:

I Swear!
"They shall not pass," said Pulsifer.
"Burn poems I forbid!"
"I quite enjoy this novel joy
Of sittin' on the lid??
Thought man of wild west bubblin' mind
I'll dodge him—sprize the kid.
Said Pulsifer:—too bad—"returned"
"It simply can't be did?"

Mr. Pulsifer acknowledges the likeness to be excellent, but declares that when he has to return a poem it hurts him more than it does the poet! Poets

are privileged to disagree. Undoubtedly they will.—THE EDITORS.

PLEASE SPARE PETER RABBIT!

RECENTLY there has been called to my attention an editorial entitled "When Do We Eat?" which appeared in The Outlook of March 1, and in which you make a plea for the abolition of useless sentimentality. You do me the honor of favorable mention of some of my stories for children, for which I am duly appreciative. At the same time you at least suggest that these animal stories are lacking in truth because my little characters always escape, and thus it is not apparent that their pursuers ever enjoy a square meal. The inference is that I and certain other writers are over-sentimental.

From the view-point of exact science, the criticism may be well founded. You have, however, missed a very vital point. If Reddy Fox should catch Peter Rabbit, tell me, pray, how Peter might be resurrected? The stories do not deal with the rabbit, the fox, the mink, the chuck, the squirrel, and other characters as species, but as individuals. Obviously there can be but one Peter Rabbit, one Reddy Fox, one Johnny Chuck, and so on. The death of any one of these would be a tragedy. Tragedy enters child life soon enough as it is. Moreover, consider the author. I have, or at least I hope I have, very many more stories of Peter Rabbit and his friends. To kill off any of them would be to end my career as an author of this type of story, and I fear that I, in my turn, would be forced to say, "When do I eat?"

In short, these little friends are individual characters. They are treated as such. In all my work I have endeavored to hold fast to fact and truth. The child understands this. He knows that all too often the rabbit does not escape from the fox or the mouse from the hawk. I endeavor to show this without having the actual tragedy, which is always a shock, bearing in mind that I am writing for little children, who are peculiarly susceptible to such shock as would be involved in the death of those whom they had come to love dearly. You will, I believe, appreciate why the escape is inevitable. If you could see the letters I have from little folk expressing their appreciation of this one fact—the lack of tragedy—and also the scores of letters from parents and teachers containing like expressions, you would understand why a fox and certain others must eat unobserved.

THORNTON W. BURGESS.

Springfield, Massachusetts.

[We only meant to give Mr. Burgess a friendly dig or two. His numerous imitators were the targets at which we chiefly aimed.—THE EDITORS.]

CONTRIBUTORS' GALLERY

KATE DOUGLAS WIGGIN was born of a prominent New England family in 1859. After graduating from Abbot Academy, in Andover, Massachusetts, she went with her family to California, where she established

the first free kindergartens for poor children on the Pacific coast. She assumed the directorship of the famous Silver Street Kindergartens of San Francisco, and to her inspiration and example were undoubtedly due the rapid and successful growth of Froebel's system of education in the West. Some of her most popular stories—though all are delightful—are "The Birds' Christmas Carol," "Timothy's Quest," "Marm Lisa," "Mother Carey's Chickens," and "Rebecca of Sunnybrook Farm."

RICHARD DOUGLAS was a first lieutenant in the Reserve Corps when the United States entered the war. He was promoted to the rank of captain August 15, 1917, and was ordered to France the following May with the 328th Infantry, 82d Division. He was cited in regimental orders as follows:

This officer successfully commanded his company in the Toul and Pont-à-Mousson fronts, through the Saint Mihiel offensive, and until severely wounded in the Meuse-Argonne offensive he had crossed the shell-swept field east of La Forge, had crossed the Aire River, and was reorganizing an attack against Hill 223. This officer at all times showed great coolness in action and a disregard for his personal safety.

THE REV. FREDERICK W. JONES is in charge of St. Paul's Church, in Hollandale, Mississippi. Before entering the ministry he was a reporter on the New York "Tribune" and the "Evening World," and also an editor on the Providence "Journal."

NATALIE DE BOGORY is a Russian. Her father, Vladimir de Bogory-Morkievitch, was one of the first group of Russian revolutionists. Miss de Bogory came to America ten years ago and carried on extensive investigations among Slavonic immigrants, and has had charge of the Foreign Information Division of the United States Employment Bureau.

LOYD R. MORRIS is managing editor of the "American Exporter." He has a thorough knowledge of foreign trade, gained partly from his service in the United States Postal Censorship during the war as chief of the Trade Division. His real interests are, however, literary. He has written a volume on Irish literature entitled "The Celtic Dawn" and has contributed to various magazines.

AGRICULTURE AND THE PERIOD OF RECONSTRUCTION

(EXTRACTS FROM AN ADDRESS DELIVERED BY W. I. DRUMMOND, CHAIRMAN OF THE BOARD OF GOVERNORS OF THE INTERNATIONAL FARM CONGRESS, BEFORE THE ANNUAL CONVENTION OF THE ILLINOIS AGRICULTURAL ASSOCIATION)

AGRICULTURAL organization activities fall naturally into two principal classes: First, the development of co-operative marketing and buying; second, education and participation in the consideration of economic policies in a general way.

Co-operative marketing is receiving major attention now. It is well that it should. These movements are inclined to follow separate crop or commodity lines. Allied crops, as of several varieties of fruits, seem to fall into workable groups, as may be the case with the grains. It is hardly conceivable that any one organization will successfully handle or attempt to market unrelated crops, as both fruit and grain, or grain and cotton, or competitive crops like oats and rice. The wisdom of confining the activities of this class of organizations strictly to the business of handling the particular crop involved is apparent.

The formation during the past year of co-operative marketing agencies and farmers' business enterprises on a scale never before attempted brings the issue of their success or failure squarely to trial. It cannot be expected that all will succeed. There will be failures. There will be losses. But there is reason to hope and believe that the correct formula, the fundamentally sound plan that can be adopted generally without assuming proportions of monopoly or breaking down of its own weight, may be worked out. There is sustaining consolation in the fact that the public generally recognizes the necessity of co-operation by producers, and welcomes it.

LET'S STAY IN THE MAIN CHANNEL

There is a school of thought which leads toward drawing agriculture apart from the general flow of business and erecting a separate set of institutions for it. This seems dangerous and unwise. Although some of its requirements, as of credits, are in a manner different from those of other industries, there is no good reason for isolating agriculture. It would lose far more than it would gain from separation. Rather, it should be given a larger place in the general business scheme. Proportionate privileges, based on its needs, in financial and other institutions serving the general public will be worth far more to agriculture than to provide separate facilities for it which might have to rely upon a restricted field of resources in time of trouble. The isolation of the farmer would mean the creation of a gap between producer and consumer. It would promote suspicion and distrust. Organized labor has traveled the road of exclusiveness and class

AGRICULTURE AND THE PERIOD OF
RECONSTRUCTION (Continued)
consciousness far enough to reveal the fallacy of that course.

INTERINDUSTRIAL DEPENDENCY

While it is true that the impairment of the purchasing power of the farmer slows down all lines of business, it is no less a fact that the same misfortune to any other class of citizens has a similar effect. Unemployment in other industries, for instance, quickly affects farm markets and prices. Organized agriculture can never make common cause with organized labor as long as the latter continues its wasteful and restrictive practices and contends for inflated wage scales and the right to curtail productive effort. But unless labor is profitably and continuously employed, the market for farm products is narrowed and prices are depressed. This, in turn, reacts, and still other industries are hit. Disaster to any class or in any industry strikes and rebounds, and strikes again, like an echo in the hills. If for no reason other than self-interest, organized agriculture should do nothing that might work injury to labor, or to any other class or industry. An impoverished customer is of little value. To secure protection against the unrestricted importation of agricultural products, for instance, without at the same time helping to protect our workmen against the products of cheap labor, paid in depreciated currency, would be both unfair and futile. . . .

PRICE FIXING

The disposition to turn to the Government for immediate and complete relief from economic ills finds expression in many ways. One of these is that it should guarantee that prices will not fall below a fixed minimum. It seems inconceivable that men who are recognized leaders of thought and who have been successful in business would advocate such an impossible thing, but some of them are doing so. If any farmer is depending upon the Government to protect him against financial losses, he had better change his occupation. The same is true of any man engaged in any business not under public supervision. The Government will not and cannot do such a thing. Any government might establish minimum prices for farm products, but if such prices were higher than those prevailing in the world markets it could maintain them only as long as its resources enabled it to absorb all surpluses. That would not be very long, even in the case of our own Government, if the hazards of financial loss were removed from the business of production. Were governmental control of prices possible, it would now be in effect throughout the world. The idea is by no means new. It has been tried out in various stages of the world's history. It has always broken down, as it always must.

need of the farmer has prevailed widely. The necessity for adequate credits cannot be denied. But we have learned two things, both to our surprise, as results of our efforts along this line: The securing of the credits from a sympathetic Government was easy; but even the enormous advance of a billion dollars has not measurably helped markets or prices, which any plan of assistance to be effective must do. Some farmers, and to a somewhat larger extent some stockmen, are being helped individually, but to many the Government credits merely offer a chance to get deeper into debt and postpone an evil day. This will be particularly true in case farm prices in general do not advance materially before the obligations fall due. We must not overlook the fact that credit, if used, means debt. Debt means interest. Interest means more debt. Pay-day always comes. Our present difficulties can nearly all be traced to the debts we contracted during the recent brief but dizzy era of prosperity. The mortgage indebtedness of our farmers has doubled in the past ten years. They are now up to their chins in personal obligations. Does it not seem advisable to try to stop the drift into debt, instead of encouraging it?

Any form of paternalism or Socialism would be destructive to our agriculture. Historians agree that most declining civilizations owed their decline to the neglect of their agriculture; but an agriculture propped up by paternalistic or class favors is only temporarily saved. Such a policy develops individual dependency and helplessness, whereas the only safe and lasting foundation for society or any of its branches lies in a self-sustaining and resourceful citizenship. It is not possible to do more for any man than to secure him against whatever might interfere with his efforts to help himself or deny him the just reward of his own efforts. . . .

CONFIDENCE IS NECESSARY

The action of the farmers in stopping buying was justified, and even necessary. But this is apparently being carried to an extreme that indicates a general lack of confidence in the ultimate restoration of agricultural prosperity. There is little reason and much danger in this. Hoarding is quite as unjustified as spending too freely. It is nearly as bad as going into debt unnecessarily. Without confidence in the future, in which the farmer must share, the general business machinery cannot again function properly. Neither fear nor resentment should be permitted to stand in the way of making needful purchases where additional debt is not incurred.

There is comfort and assurance in the fact that the most powerful and influential farm organizations in this country have so far not been misled by false economic teachings. They have shown remarkable patience and fortitude in a time of stress such as might cause a less able leadership or a less thoughtful or loyal membership to heed the voices of radicalism or follow irresponsible demagogues into the quagmires of politics.

The people shown in this picture were photographed on Fifth Avenue, New York, four years ago. How many were afraid? How many things that they feared would happen to them have happened?

Are YOU Afraid?

FEAR is the age-old enemy of the human race. It is just as powerful today as ever! All of us are its victims in some degree. Fear robs us of the happiness and success that should be ours. Fear destroys hope! Fear chills ambition! Fear is the blast that sears and withers souls! Fear is the partner of defeat.

What are you afraid of? Of losing your health? Your money? Your position?

Basil King says, "Everyone is living or working in fear. There is not a home or an office or a factory or a school or a church in which some hang-dog apprehension is not eating at the hearts of men, women, and children." He says this in his new heart-stirring book entitled:

The Conquest of Fear

This inspiring book was written by a man who himself passed through the deep waters of despair and emerged triumphant. Out of his own experiences and experiences that are common to us all, he has created this extraordinary book that vivifies and analyzes that strange illusion we call fear. The good you can get from this book is well-nigh inestimable.

Free Yourself from Fear

The most Extraordinary Non-Fiction Book of the Year!!!

A prominent New York lady recently bought this book. She has ordered ten

more copies saying, "It has helped me so much I must give it to my ten best friends."

A woman in Riverdale, R. I., after reading "The Conquest of Fear," wrote to the author and exclaimed, "I want to try and thank you for the comfort and strength it has given me. Now I feel FREE."

A member of a well-known family in Boston wrote Mr. King, "The fact that you have told so much of your own experiences doubles and triples its value. . . . It is the first time that God has been explained to me as a working power in my life."

You can share the happy influence of this powerful book, too!!!

Basil King, the author of this amazing book, has been flooded with letters like these.

Send No Money

SCOTLAND'S GRANDEST TOURS—

Wonderful Fiords
Nearer than Norway

1. **GLASGOW TO OBAN** by
magnificent swift Saloon Steamer "Col-
umbia," viewing the Shipbuilding on the
Clyde, passing Dunbarton Castle, and
calling en route at the beautiful Clyde
watering places of Dunoon and Rothesay,
thence by the famous Kyles of Bute,
Crinan Canal and Firth of Lorn.

2. **OBAN TO STAFFA AND
IONA** is the grandest One-day Tour in
the British Isles, visiting Fingal's Cave
in the Isle of Staffa, St. Columba's Sacred
Isle of Iona, with its ancient Cathedral,
and the burying place of the Scottish
Kings, and passing the ancient Castles of
Dunollie, Duart, Ardtornish, Aros, Min-
garry, and Ghyllan, also Tobermore Bay,
where lies the Armada specie ship.

3. **OBAN TO INVERNESS** via
beautiful Loch Linne and Loch Eil,
passing the scenes of the adventures of
Alan Breck, the hero of Robert Louis
Stevenson's famous novel "Kidnapped,"
viewing Glencoe, the scene of the great
massacre, and calling at the ancient
little town of Fort William, sheltering
pleasantly at the foot of Ben Nevis, Brit-
ain's highest mountain, through the
famous Caedonian Canal, Loch Oich and
Lochness, the land of Prince Charlie and
his loyal clansmen.

If these tours are not in your itinerary,

BOYS wanted. 500 boys wanted to sell The Outlook each week. No investment necessary. Write for selling plan. Carrier Department, The Outlook Company, 381 Fourth Ave., New York City.

SUMMER cottage camp for little girls. Unusually safe. Delightful. Terms moderate. Highest references. 1,551, Outlook.

COPYING done, stories prepared for press. 1,549, Outlook.

BY THE WAY

CHILDREN get fewer hours for sleep under the operation of the English Summer Time Act—a law similar to our daylight saving laws—according to a report of the British Board of Education, but “this is not the fault of the Act, but the fault of the fathers and mothers who allow their children to stay up till sunset. . . . In a well-regulated household parents fix an hour for the young people's going to bed and enforce it rigorously. It has become of increased importance that children be sent to bed by the clock and not by the sun.” But English children, like those of America, probably strongly object to going to bed while it is still broad daylight.

It is to be hoped, however, that few of the British children above mentioned have yet assumed the airs of a young girl described by a New York City school principal in an article in the “Evening Post.” He says: “I felt rather queer when I saw a fifteen-year-old girl taking her black coffee and cigarette with the family and the guests and giving a stately gray-haired gentleman her opinion about the modern girl and the new dances. I thought she might better have been in her own room minus coffee and cigarette and the opportunity to instruct her elders. There is always some way to protect children and save them from themselves if one takes the trouble to think about it.”

“I one day rode into the village of Jelameh, which stands off the Nazareth road, on the plain of Esdraelon,” says a writer in the London “Country Life.” “I saw a boy making coffee. In a light pan over an open fire he roasted the berries, taking them out only when they were done almost to the point of being burnt. He poured them into a carved wooden mortar and pounded them with a pestle, beating time with the latter to a song. He then put on the fire a copper pot of water and let it boil, then took the pot off and put in the coffee; the pot was then returned to the fire till there was such a fuss and ferment that it had again to be taken off. This was done three times, and by the end of it the water had got to the very vitals of the coffee. It was drunk without sugar—for what need had it of sugar? A cup of this coffee allays the nerves, clarifies the brain, and sweetens the temper.”

News photographers perform many daring feats in the pursuit of their profession, but they are seldom recorded as walking almost literally into the lion's mouth. Colonel J. C. B. Statham, in “Through Angola,” tells of a lion hunt in which the lion, badly wounded, fled to the bush. The hunters, among them a photographer, followed the bloody trail. “The photographer spotted the lion's head, looking out of a bush, and, appealing to the others not to spoil a good chance for a dramatic photograph, quietly walked towards the lion. The

**BY THE WAY**
(Continued)latter, possibly from astonishment, and
more probably because, happily for the
photographer, he was nearly dead, al-
lowed the man to approach within a
few yards of him. Then he roared and
charged: The photographer fled, fol-
lowed by the lion; both fell, exhausted
and close to each other. One of the
hunters fired and killed the lion." And
the photographer, in his justifiable ex-
citement, apparently failed to press the
button!Another sporting story comes from
Santa Catalina Island and appears in
the "Catalina Islander." It tells of an
angler who caught two tuna fish on the
same line and at the same time. The
first tuna, weighing 103½ pounds, was
hauled in with a "half hitch" of the line
around its upper jaw. The fisherman
put his rod down to assist the boatman
in getting his fish aboard, and on pro-
ceeding to pull in the remainder of his
line found he had another fish on his
hook! The fight for the two fish, the
second of which weighed 98 pounds,
lasted three-quarters of an hour. The
feat is characterized by an eye-witness
with pardonable enthusiasm as "un-
doubtedly the most unique in all angling
records."Here is an epitaph "with a difference"
—from the "Ohio Sun Dial:"

Here lie the bones of Ed McGee—

A wiz at snappy repartee.

The butt of Eddie's sharpest quip

Packed a six-gun on his hip!

Apropos of the above, but in more
serious vein, the following advertise-
ment is quoted as having lately ap-
peared in bold type in a Chicago paper:I will pay \$1,000 to any one who
will give one good reason why the re-
volver manufacturing industry should
be allowed to exist in America and
enjoy the facilities of the mails.There is a brief article on this subject
which we venture to call to the atten-
tion of the man who makes this gener-
ous offer. Part of the article reads,
"The right of the people to keep and
bear arms shall not be infringed." The
check for \$1,000 should be made payable
to "The Outlook Company."Bohemian glassware has long been
noted for its artistic quality, and it is
now, a Vienna paper called "Reconstruc-
tion" reports, to be treated by a process
that will make it practically unbreak-
able. "The Kavalier glass works in
Bohemia have been successful," the re-
port says, "in producing glass which is
absolutely unbreakable and extremely
difficult to cut, even with a diamond or
any other carborundum stone. It can be
thrown on a stone floor from a height of
from three to four meters, and used as
a hammer for driving nails without suf-
fering the least damage. Neither is it
affected by sudden changes of tempera-
ture." The glass is manufactured from
a special kind of sand which is found
as yet only in limited quantities.

Do you borrow Garden Hose or lend it?

Whichever you do, you will enjoy Mr. Butler's inimitable garden hose story, "Millingham's Cat-Fooler," which we have obtained permission to reprint for the entertainment of our friends. 32 pages bound in boards and illustrated with amusing pictures. *Sent FREE to promote your garden hose education.* This book contains no advertising, direct or inferential. With it we enclose a pamphlet:

"The Truth About Garden Hose"

which tells you how to know good hose when you see it, how to get the kind of hose best suited to your needs, and how to care for it to make it wear as long as possible. A book of valuable information for every gardener, florist, garage owner, or other user of hose. Incidentally, it tells you about our three standard brands of garden hose.

BULL DOG MILO GOOD LUCK

and explains why these particular brands have become within 5 years the most widely talked of hose on the market, and why one of them will exactly fit your garden hose needs. Send for these books today.

BOSTON WOVEN HOSE & RUBBER CO.

Portland Street, Cambridge, Mass.

Largest makers of Garden Hose in the world and manufacturers of the famous GOOD LUCK fruit jar rubbers

Get the Full Joy of Gardening

by having the right things to work with. Cheap, shabby hose is a constant temptation to let the garden go thirsty. Good hose, properly cared for, is a joy to use and will last for years. Ask your dealer to show you our three standard brands of $\frac{5}{8}$ ths inch garden hose sold at good hardware stores everywhere.

$\frac{5}{8}$ ths inch is the right size for garden hose. Practically all house fittings are $\frac{1}{2}$ inch in diameter and $\frac{5}{8}$ ths hose will deliver the water as fast as it can come through the pipes.

Bull Dog

Highest quality garden hose made. 7 plies of strong cotton cloth held together with live rubber. Lengths bought 14 years ago still in use.

Good Luck

Made like BULL DOG, but with 6 plies instead of 7. Lightest garden hose to lift and lightest on the purse.

Milo

Moulded garden hose with a corrugated cover. As near kinkproof as garden hose can be made.

All letters of inquiry should be addressed to THE OUTLOOK FINANCIAL DEPARTMENT, 381 Fourth Avenue, New York

WAGES AND PRODUCTION

OF late years there has been much talk about "living wages," and more recently the demand has been made for labor that it must have, not only a living wage, but a "saving wage" as well. Minimum figures have been given, stating just how many dollars a year a man must have in order to earn these wages. The people using these phrases and offering these figures are almost always talking about wages in terms of money. And "money wages" are not real wages at all. Wages are low or high depending upon whether, translated

into goods, they will buy little or much. Production largely determines the price of goods, and if goods can be produced cheaply they can be sold cheaply, and the value of money received in exchange for labor performed is wholly dependent upon how much it will buy.

The writer of this article was talking with a man recently who said that his father had raised a family of six children on wages which had never amounted to more than ten dollars a week. That was thirty years ago, and to-day it would doubtless

Straus Plan Securities 40 Years Ago and Today

FORTY years ago the first securities safeguarded under the *Straus Plan* were underwritten by us and sold to a small clientele of investors. Today, our business has grown to a nation-wide institution, with offices in fifteen principal cities. In these forty years—

We have sold hundreds of millions of dollars in safe investments, without loss to their holders. Tens of thousands of investors have found safety, satisfaction, freedom from worry, and prompt payment of principal and interest in cash, in Straus Bonds.

If you are not fully acquainted with the *Straus Plan* and the reasons for our record of 40 years without loss to any investor, we invite you to call and discuss the matter, or, if you prefer, to write and specify

Chicago—Straus Building

FORTY YEARS WITHOUT LOSS TO ANY INVESTOR

be impossible, and ten dollars a week seems a very small sum for a man to earn. The point to remember, however, is that if ten dollars a week was sufficient to supply the wants of such a family it was certainly a "living wage." Another point to be emphasized is the fact that if ten dollars a week would support that man and his family thirty years ago as well as forty dollars a week earned by a man with a similar family will do now, wages have not increased since that time, but remained stationary.

Similarly if a man got forty dollars a week during the war, when prices were high, and gets only thirty dollars now, his wages have not been decreased if the cost of his living has also dropped twenty-five per cent. Any one who is getting as many dollars now as he did three years ago is in reality receiving higher wages than previously.

This is a simple economic principle that is often ignored by labor leaders, who frequently know better. Another obvious fact is that, in the last analysis, wages are not paid by the employers. The consumer is the man who pays the costs of production, and every one is a consumer. When the wages of labor are increased, labor itself helps to foot the bill. Workers in the various industries are not only working for each other, but they are paying one another's wages.

This is one of the main reasons why it seems unfair for one class of workers to demand compensation entirely out of line with that received by those employed in some other kind of business. The case of farmers and miners affords a striking illustration in point. It is said that the miners were receiving over thirty per cent larger wages this spring than they got when commodity prices were at their highest point; farmers, on the other hand, have about one-half as much now as they had then. The miners have been organized by the labor people and were able to force an acceptance of their demands, and apparently their leaders had little regard for the rest of the country so long as they could take good care of themselves. It is neither fair nor wise for any one class to insist upon increased compensation for itself at the expense of the others. If coal goes up in price, so will light and heat and the cost of many factory products as well, and miners themselves cannot escape paying their share of the higher prices.

Higher prices for coal (using it for the sake of illustration) mean a lessened demand for it, and production of coal will drop off, causing unemployment. In other words, some of the men demanding higher pay may in reality be laying plans to put themselves out of a job. This same condition of course applies to any kind of manufacturing and producing business.

Farmers are the most important class of people in the country so far as production goes. They are also the largest single group of buyers. With the prices of farm products so low that in many cases they do not cover cost, it is only natural that the farmers are unable to

For your trip abroad—

(Continued)

buy. This is an unfortunate circumstance for the farmers of course, but it also affects coal miners, railway workers, factory employees, and many other classes of people as well. If the compensation paid these other people were reduced to correspond with what the farmers are receiving, then the farmer and everybody else would be on the same level and there would be a large demand for goods of all kinds and the country would be far more prosperous. There is no question but that actual wages—not "money wages"—would be larger if transportation rates could be lowered and if production costs could be reduced.

So long as one class tries to feather its own nest at the expense of the others the co-operation necessary to a proper adjustment in the world of business is bound to be lacking. We were taught in our childhood that the best way to get golden eggs is by taking good care of the goose, not by killing it. No business organization ever made a success unless its various departments worked together, and a nation is nothing more than a big business enterprise.

It is not to be expected that everybody will receive the same amount of compensation. Everybody is not worth the same. Allowances must be made for ability, skill, education, industry, and the kind of work that is being done. But a balance can be struck between the various industries, and it is such a balance that is more needed to-day than anything else in the world of business.

It cannot be too strongly emphasized that it is not so much a question of actual dollars and cents that determines prosperity, but rather the quantity of goods produced. Progress in industry depends more upon cheaper and greater production than upon increases in money wages. If disputes could be eliminated from industry and better methods adopted for increasing output, it is estimated that an increase of from forty to one hundred per cent could be effected in the amount of goods purchased. This would mean lower prices and increased purchasing power for all classes of people, the real test of industrial progress.

Labor leaders have usually opposed improvements and methods for bettering production which have decreased the amount of labor required. Their theory has been that automatic machinery and labor-saving devices have made fewer jobs available, lessened the demand for men, and worked injury to the wage-earners. This is a mistaken attitude and is based upon the erroneous idea that the amount of work to be done is limited, that the fewer men there are required to do a certain kind of work, the fewer jobs there will be. As a matter of fact, there is no limit to the amount of work there is to be done. There is no end to the wants of mankind, and the answer to the question of social betterment is not limiting production, but increasing it by every available

Increase Your Knowledge of BONDS

EVEN though a consistent bond buyer, there may be some points about bonds, concerning which you desire more complete information. If an investor in other lines or a beginning bond buyer, you owe it to yourself to become fully informed on the merits of bonds as investments.

"Bonds—Questions Answered—Terms Defined"

In the thirty-six pages of this booklet are discussed the questions which our extended experience has shown are those most frequently asked by bond buyers. Its contents also include non-technical definitions of the most commonly used bond terms.

MAIL COUPON BELOW and copy of booklet will be sent promptly without obligation.

means so that these wants may be satisfied.

If in a certain industry methods are found of saving labor and at the same time increasing output, the labor saved there can be used somewhere else and used to increase production in some other line. When the hand loom was replaced by machinery, many workers were thrown out of employment. No one can say, however, that mankind did not derive immense benefit from being able to buy clothing cheaper and in greater quantity than had previously been the case, and the men and women no longer needed in that industry became immediately available for employment elsewhere, and production in other lines was correspondingly increased. The Ford automobile is an example of what enormous production can do in the way of bringing prices within the reach of a large percentage of the population. Does any one suppose that, if Fords were all built by hand and instead of one being completed every twenty-seven seconds only two a day were turned out, it would be possible to purchase them at the prices they are sold for to-day. Labor-saving devices and automatic machinery in the Ford factories, far from decreasing employment, have increased it enormously.

Production is the answer to the wage problem, not more dollars.

ARE YOU AN INVESTOR?

During the past year the Financial Editor of The Outlook has helped hundreds of Outlook readers to solve intelligently their particular investment problems. Perhaps you are contemplating a shifting of your present holdings or have fresh funds to invest. In either case we shall be glad to give you specific information on any securities in which you may be interested. A nominal charge of one dollar per inquiry will be made for this special service.

Forces That Cry Out for Nationalism

THE Princes and rulers of the Indian States, enjoying their authority through treaty with the British Government, strongly support the present régime. But there are parts of India where patriotism is blazing! Would the Indian be able to run his own government? The British say that the Indians are lacking in administrative power. Gandhi, the great leader of the Nationalist movement, says: "It is intolerable that the British in India should consider the Indians inferior. Such a thing is . . . a menace to the British Empire." Gertrude Emerson, associate editor of ASIA, just back from India, tells the complicated story in "Raw Material for an Indian Nation."

UNDER the leadership of Mustapha Kemal Pasha, the National Organization of the Turks in Asia Minor has been perfected. The Army is one for the integrity of Turkey, and the people stand solidly behind the Army. They want foreign capital for the development of their country, and the opening up of Asia Minor would be the pouring of new life into the Near East.

So says Laurence Shaw Moore in "The Three Hundred and Twenty Little Sultans."

FURTHER North and East, the same irresistible longing for a people to govern themselves is being tried out in the Far Eastern Republic. Siberia is not Bolshevik, and the Government is not a Bolshevik Government. The Siberians want a Democratic Republic. They want to join the family of nations. They, like the Anatolians, cry out for help—but not for charity.

"Four Years of Mistakes in Siberia," by Charles H. Smith, goes into the very inside of affairs in Siberia and America's shortcomings in handling the situation.

Thus does the flame sweep over Asia, springing up at great distances in all parts of the Orient with a force that is shaking the world. Read the June issue of

St. John's Riverside Hospital Training

School for Nurses

YONKERS, NEW YORK

Registered in New York State, offers a 2½ years' course—as general training to refined, educated women. Requirements one year high school or its equivalent. Apply to the Directress of Nurses, Yonkers, New York.

When he suddenly takes to soap-and-water—

Your boy!

For all too short a while he will be in your home.

There comes a time in every boy's life when his dislike for washing suddenly disappears, and for mysterious reasons he begins to scrub.

While he is still with you, encourage this cleanliness. "So great is the effect of cleanliness upon man that it extends even to his moral character."

Give him plenty of Ivory Soap for his face and hands. He can wash a dozen times a day with Ivory and his skin will still be soft and smooth.

Give him Ivory for his bath—it lathers so richly, it rinses off so quickly and "It floats!" It is pure and mild; white and fragrant, too.

In all these seven different ways, Ivory is a manly, friendly, fine soap for boys.

Whenever soap comes into contact with the skin—use Ivory.

IVORY SOAP

99 $\frac{44}{100}$ % PURE

Ivory Soap comes in a convenient size and form for every purpose

Small Cake
For toilet, bath, nursery, shampoo, fine laundry. Can be divided in two for individual toilet use.

Large Cake
Especially for laundry use. Also preferred by many for the bath.

Ivory Soap Flakes
Especially for the washbowl washing of delicate garments. Sample package free on request to Division 24-E, Dept. of Home Economics, The Procter & Gamble Co., Cincinnati, Ohio.

The Outlook

MAY 24, 1922

MOVING FROM GENOA TO THE HAGUE

TO those who expected great things from the Genoa Conference the outcome must be little short of a tragic disappointment. In particular, Lloyd George, who apparently hoped to create a happy family out of the nations of Europe, must be discouraged. Indeed, despatches from Genoa indicate that his experiences at Genoa have had a physical effect which is shown in the unwonted gravity of his demeanor and in the signs of weariness on his face.

There ought to be, however, nothing unexpected in the failure of the Genoa Conference to secure practical co-operation. No conference under the circumstances could have succeeded which disregarded, as the Genoa Conference did, certain fundamental facts. To try to build economic prosperity without laying first a foundation of good faith and of confidence has proved this time, and will always prove, to be futile. Obviously what is lacking in Russia and in Germany is not primarily money or resources or intelligence, but good faith. And with that lacking there can be no confidence in either Russia or Germany. What Genoa tried to do was to secure an economic system that would work without waiting for Russia and Germany to prove their good faith by the evidence of their deeds.

To move from Genoa to The Hague and to change the Conference from one of governmental delegates to one of experts, as has been decided, will not bring any solution so long as there is lacking confidence and the good faith which is requisite to it. It is therefore not surprising that the United States Government has declined the invitation of the Powers to send experts to meet with theirs at The Hague on June 15.

The Russian Bolsheviks want, of course, all the money and all the recognition that they can get. They have got a great deal more recognition than they deserve, but they have not yet got the money, or its equivalent in credit, which they want. Last week we recorded the demands of the Powers upon Russia to observe its obligations and to recognize the rights of property in Russia held by foreigners. Since then the Russian reply has been received, and it has proved to be quite unsatisfactory. The Bolsheviks do not want, as the Powers propose, to have credit extended by these Governments to such of their merchants

as wish to trade with Russia; they want these Governments to extend credit to the Bolshevik Government itself. The object of this of course is to enable the Bolsheviks to get a firmer hold upon the country than they now have. The Bolsheviks complain that the Powers are trying to interfere in the internal affairs of Russia, and with some skill undertake to play upon the differences of opinion between Britain and Italy, on the one hand, and France and Belgium, on the other hand. In their answer they propose a mixed commission of experts to study Russian finances. The Allies do not want a mixed commission—that is, a commission in which Russians would be on an equality with the representatives of the other countries. The conclusion of the matter is that there may be a commission of Russians who will be called upon to confer with the commission of delegates composed of other nations to meet probably at The Hague.

AMERICA'S DECLINATION

IN the very prompt reply sent to the invitation extended to America by the Powers, the Secretary of State, Mr. Hughes, says that the American people have proved their unselfish interest in Russian recuperation; but for such recuperation there are conditions which in the nature of things must be provided within Russia itself. It is because the Bolsheviks by their answer have failed to show any apparent recognition of the need of supplying those conditions that our Government regards it as useless to participate in any discussion of Russia's circumstances.

As Mr. Hoover has pointed out in an address before the International Chamber of Commerce, the United States is not dependent upon Russia in any degree for its own prosperity, and as long as Russia persists in living on her own fat and not undertaking to establish the foundations of productivity, all that we can do for her will be in the nature of credit (which is obviously unjustifiable) or charity. "Production," said Mr. Hoover, "is conditioned upon the safety of lives, the sanctity of contract, and the rights of free labor."

Does this sound obvious, platitudinous, trite? We should have supposed so except for the fact that the Genoa Conference has proceeded on the principle of virtually ignoring it. Fortunately for France, her interests are such that

they are served by a recognition of this elementary truth, and some of those who think that France was an obstructionist have perhaps come to see that what has obstructed the Genoa Conference has been this elementary rule of conduct which the Conference has chosen to disregard.

A BLACK BOOK

A RECENT number of the London "Times Literary Supplement" contains an interesting account of a volume in French entitled "Un Livre Noir," which it justly characterizes as "of great value to historical students." The author, a French journalist, has been allowed access by the Soviet Government to the Russian diplomatic archives and has given in this book extracts from the diplomatic correspondence of the Russian Ambassador at Paris, M. Isvol'sky, from 1910 to the outbreak of the war.

The first volume contains a selection of letters from 1910 to 1912. "We seem to find in these confidential letters," says the reviewer, "a cynical, clear-headed man of affairs, whose object was to cement the alliance with France and the understanding with England as the best means of defending his own country against the many dangers to which, as he himself says, it was exposed owing to the very extended frontier and the wide range over which its interests spread. . . . Of desire for war there is no evidence, though there is much that he, like every other statesman in Europe, frankly recognized that war might come at any time, and that if it did come it was very important that the Entente should be prepared for it." Incidentally, it indicates that France and England were equally desirous to avoid war; and also that M. Isvol'sky, "to control the French press, made a suitable expenditure of money," though the discussion of this subject, the English reviewer wisely thinks, "had better be left to the other side of the Channel."

This diplomatic correspondence, which the public was never intended to see, confirms the evidence afforded by the published letters and telegrams of France, Belgium, and England immediately preceding the war, which made evident the eager desire of those countries for peace. The publication of this Russian correspondence increases our wonder that to President Wilson the

causes of the war should have seemed obscure. Whether our Ambassadors failed to see what M. Isvolsky saw so clearly, or Mr. Wilson's optimistic Secretary of State did not think their reports of sufficient importance to call the President's attention to them, or the President did not take them seriously, we do not know and probably never shall know, though the post-war publications of Henry van Dyke and Brand Whitlock indicate that the war was not altogether a surprise to them.

FOR A NATIONAL COAL INQUIRY

IN the discussion over the present coal strike public opinion has centered quite surprisingly in a demand for a National Coal Commission. The opinion is also strongly expressed that such a commission should not be formed merely to try to end the present difficulty, but that it should continue permanently, just as the Railway Labor Board does; and that it should seek and publish the essential facts relating to the production, sale, carriage, and distribution of coal.

The Bland Bill, now before the House, does not answer to this definition, but does provide for investigation of the facts in the coal industry. The bill as it now stands would provide for the appointment of what it calls a Coal Investigation Agency. This body would have ten members; four would be the heads of the Geological Survey, the Bureau of Mines, the Census Bureau, and the Bureau of Labor Statistics; the other six would consist of three groups of two each, representing the public, the miners, and the operators. These six men would be appointed by the President with the advice and consent of the Senate; the two men in the miners' group to be chosen from four names presented to the President by the head of the United Mine Workers of America, the two members in the operators' group to be chosen from nominees jointly named by the presidents of the Anthracite Bureau of Information and the Anthracite Coal Operators Association. The proposed Coal Investigation Agency is to continue for two years only. This will seem undesirable to those who believe firmly in a permanent coal commission.

Another debatable section of the Bland Bill is that which strictly enjoins the members of the Agency to make public no facts learned by them in the course of their investigation except in reports to Congress. As it is provided that no report need be made by the Agency until the end of its term, this does not seem to be a good method of informing the public of the basic conditions and facts in the coal industry,

which is precisely what is needed. It is quite right that the Government should not disclose trade secrets when to do that would injure one competitor as against another, but immediate inquiry and publication of the results of inquiry are certainly desirable.

The Bland Bill does not direct the proposed Agency specifically to bring about the arbitration of the present controversy, but directs it to provide Congress with facts as a basis for legislation "to settle industrial disputes in and prevent the overdevelopment of the coal industry, to stabilize such industry and levy taxes in respect thereto, to regulate commerce in coal among the several States and with foreign nations," and so on.

In presenting this bill to Congress Mr. Bland, who is Chairman of the House Committee on Labor, stated, among other things, that there is no agency in the Federal Government to-day "which has ascertained, or can ascertain, the correct production cost of a ton of coal in a well-operated, efficient mine." He remarked in this connection: "Operators came before the Committee on Labor and obstinately refused to give their cost of production, and it is fair to presume that such reports as were voluntarily made by them to existing Government agencies, who did not have the right to examine books, investigate contracts, and cross-examine witnesses, were padded and unreliable."

Mr. Bland also pointed out the great and pressing necessity of dealing with the overdevelopment and overproduction of the coal-mining industry. This is undoubtedly a crucial point. He declared that there are about one-third too many coal mines and one-third too many miners for the proper economic operation and development of the industry. He also recognized the importance of making the industry free from the present "seasonable" difficulties; and ended by a strong affirmation that the coal industry has become quasi-public in character and of vital concern to the whole people.

THE CHILD LABOR LAW INVALID

THE United States Supreme Court has without dissent decided adversely as to the constitutionality of the Child Labor Law enacted in 1919. It seems, therefore, that for the tremendously important matter of preventing abuses in this direction we must look to the laws of the several States. These laws differ widely in their nature and enforcement. There is a true sense in which the regulation of child labor in the interest of humanity and of the future of the country is a National question. As we have pointed out heretofore, there is an inter-

State aspect, in that States that have efficient child labor laws are at a disadvantage commercially in competing with States in which such laws are lax or not well enforced. The failure of this second attempt to regulate child labor by National law must be accepted as necessary from a legal point of view, but from the humane point of view it is regrettable.

In each of the decisions of the Supreme Court as to a National child labor law the view taken was that the law passed by Congress was an attempt to regulate child labor by the imposition of a tax. Both cases came up through a lower court in North Carolina. The Owen-Keating Law forbade the interstate transportation of the products of factories where restrictions as to child labor were not observed; the law now declared invalid placed a tax of ten per cent on profits made on products when child labor had been employed contrary to the restrictions of the law. The present decision indicates that the Court saw no difference between these two methods of applying Federal regulation.

Chief Justice Taft, who read the decision, declared that "its prohibitory and regulatory effect and purpose are palpable." He added: "There comes a time in the extension of the penalizing features of the so-called tax when it loses its character as such and becomes a mere penalty with the characterization of regulation and punishment. Such is the case in the law before us."

The whole effect and purport of the Supreme Court's decision is that the regulation of intra-State labor conditions belongs to the State and not to the Federal Government, and that child labor has no bearing on inter-State commerce. Though we do not see how the Court can take this view, such it seems clearly to be.

A BUSINESS THERMOMETER

IN an issue of The Outlook in January, 1908, it was pointed out that the flow of American immigration was regulated by the law of supply and demand and that its eastward and westward currents might be accepted as a thermometer of the condition of the American labor market. This fact was established by the sudden cessation of industrial employment following the financial disturbance of that year, which was looked upon as the puncturing of a bubble of inflation. The consequent reduction in the stream of incoming aliens and the rapid increase in the outward flow of immigrant laborers until it exceeded in volume the incoming were immediately recognized as an economic symptom.

With the outbreak of the war, however, this test of labor conditions was

THE GREAT AMERICAN OSTRICH

eliminated. Whether it would be again established, particularly following the adoption of the present restriction law, was a question. Recently figures of outgoing and incoming aliens showed that the outward and inward currents were closely balanced. The old economic law is working again. There is a reduced demand for laborers and there is practically no increase in the alien population of the country. The measures of restriction have been for the time being of less effect than the law of supply and demand in restricting the alien increase in population. The Immigration Law does not recognize the fact that the outward flow is constantly going on. When the quota of each country is determined, no effort is made to give it the benefit of the outbound movement. The actual increase in total number of a given nationality is less than contemplated by those adopting the law, or at least by the general public.

For instance, the immigration figures for the fiscal year up to April 1, which have just been gathered by the Bureau of Immigration, show that the increase in alien population for the nine months was only 59,892, the difference between the total of 330,223 who entered and of 270,331 who departed. It is interesting to note, as illustrating the rapid expansion of the American business and tourist traffic since the close of the war, that in the course of the same period 162,741 United States citizens arrived in the country and 197,315 departed. Evidently American emigration is a second channel by which the proportion of aliens may be increased. No law will touch one of these channels.

There are other figures in the statement of the Bureau of Immigration which are of interest. The number debarred approximates a thousand a month, the chief causes being likelihood of becoming a public charge, which claims one-third of the total, and those in excess of the quota established by law. The two causes together account for approximately fifty-four per cent of all debarred. Whatever value the literacy test possesses as a restrictive agency is indicated by the fact that those over sixteen years of age excluded for inability to read were only 730, or less than one-twelfth of all debarred, and an infinitesimal part of those seeking American shores.

AN UNWISE NOMINATION

PRESIDENT HARDING recently sent in for confirmation by the Senate the name of Mr. Nat Goldstein. The post for which he had been selected was that of Collector of Internal Revenue at St. Louis. It happened that Mr. Goldstein received no little publicity at the time

of the last Presidential campaign. He was a supporter of Senator Lowden. Testimony was brought out before a Senate committee that Mr. Goldstein received a check of considerable size from Senator Lowden's campaign manager. It has been said that this check was given for perfectly proper political expenses in connection with the primary campaign. We do not presume to question this statement.

It will be remembered that delegates from Mr. Goldstein's district supported Lowden in the deadlock with General Wood and that it was the transfer of the Lowden delegates to Senator Harding which assured his nomination for the Presidency.

All these facts taken together created so much opposition in the public press and in the Senate to the confirmation of Mr. Goldstein that he has found it necessary to relieve the situation by requesting the President to withdraw his nomination.

In politics the appearance of evil is sometimes as disastrous as evil itself. With all the material available in St. Louis for public office, it does not seem to have been a wise political move to have selected a man for the office of Collector of Internal Revenue upon whose record a shadow of public suspicion rested. We do not mean to infer in any way that the suspicion was justified. But the nomination of Mr. Goldstein was an open invitation to Mr. Harding's opponents to train their guns upon one of his nominees. Hindsight shows the nomination to have been unfortunate. Political foresight should have shown that it was distinctly unwise.

THE UNFORGETTABLE

IT is an ineradicable instinct of man to create memorials. In stone or on canvas, with chisel or with brush, we carve and depict the men and the events which shadow forth the ideals of the past or the progress and hopes of our own time.

We make mistakes. Bronze and marble not infrequently endure long after the events which they commemorate have been forgotten. Poets whose volumes lie dead on the shelves of libraries, statesmen who have dwindled away to the stature of petty politicians, soldiers whose wreaths of victory have long since faded, encumber our cities and fail even to arouse the passer-by to wonder when they lived or how they served.

The two memorials whose counterfeit presentments appear upon the opposite page recall a man and an event which cannot and must not know oblivion. On the banks of the Potomac, the great fane which houses French's colossal Lincoln will stand as a witness to a spirit that

will live as long as America exists. Just so long should endure the memory of the courage and sacrifice which called forth the painting that is the gift of France to the American Legion. Though the canvas crumble and the artist be forgotten, the union commemorated in these gallant figures has been graven on the hearts of two great nations. There are some things more lasting than bronze.

THE NAVY AS A BUSINESS INVESTMENT

ONE of the natural—perhaps inevitable—consequences of the Armament Conference at Washington has been the somewhat broadly disseminated opinion that it was a conference for disarmament. That opinion has been reflected in Congress, as shown by the attempt to withhold funds necessary for the maintenance of the Navy established by treaty. It has been believed by some that the purpose of the Conference was to reduce naval expenditure, and therefore to relieve the country from taxation.

How little effect upon the burden of taxation it would have to do away with all naval expenditures was pointed out in a recent speech by the Chief of the Bureau of Naval Operations and ranking officer of the Navy, Admiral R. E. Coontz, in a speech before the National Association of Manufacturers in New York City recently; he pointed out the fallacy of the idea that even a complete naval holiday in battleship building would mean a great reduction in taxes. Suppose, said he, that Congress should appropriate \$300,000,000 a year in maintaining a Navy. That means less than \$3 per capita for a whole year. To abolish the Navy altogether would therefore not be much of a saving.

If we are not going to abolish the Navy—and nobody imagines for a minute that we are going to abolish it—we certainly ought to have a Navy that would do the work that it is designed to do. This does not mean that it always ought to be fighting. On the contrary, the Navy that is fit as a fighting force in war is of great service in time of peace. In proportion to its efficiency, it is a protection for our foreign commerce. If our Navy does not guard our interests, nobody will. For example, Admiral Coontz pointed out that the Greeks and Turks are at war, and therefore our interests in the zone of war are in need of protection. "Naval forces," he said, "are maintained throughout the Caribbean Sea to keep down revolutions, protect life, and guard our commerce. Our fruit trade in the West Indies is enormous. In 1921 we imported fruit valued at about \$50,000,000, and much of

HEROIC MEMORIES

The dedication ceremony will take place on Decoration Day. The head of a man standing at Lincoln's feet would not reach to the knees of the heroic figure.

this came from countries bordering on the Caribbean." Such examples he cited as showing how our Navy protects our interests when our country is at peace. As such a protector of commerce our Navy is inexpensive. For \$3,000,000 a year, which, it is estimated, it costs to guard our interests in the Asiatic area, our Navy protects the exports which we send to China to the value of \$145,000,000, and that is only one element in our Asiatic trade. "Does it seem unreasonable to you," Admiral Coontz asked his hearers, "that with our sea forces keeping an open market throughout the world for some \$8,000,000,000 in annual American exports, we should expend \$300,000,000 a year for the Navy?"

Admiral Coontz reminded his hearers that the American people have always been inclined to wreck the Navy after each war. They did so after the Revolution. Thereupon the Barbary pirates began seizing the wheat we had been shipping to the Mediterranean markets, and Congress was forced to appropriate money for building fighting ships. "So," said Admiral Coontz, "when the farmer in the Great West asks why he should be taxed to build battleships, you can tell him that we built our first man-of-war in 1794 in order that his wheat could be safely delivered to foreign markets."

UNEMPLOYMENT

WHenever there is any general distress or difficulty, people in all countries yield to the impulse to turn for help to the Government. This is partly due to the inclination of man to shift responsibility from his own shoulders to others', and partly to the reasonable supposition that the very purpose of government is to furnish common protection and a common means for the common weal. When, therefore, there is a period of depression such as that through which this country has been passing, and men by the hundreds of thousands are out of employment and find themselves and their families in want of the common necessities of life, it is inevitable and to some degree just that those who feel the pinch should look to the Government for relief.

Not long ago the Brooklyn Chamber of Commerce adopted resolutions asserting as a fact that the employment situation was still acute and calling upon the Mayor and Board of Estimate of the City of New York and upon the Governor and the Legislature of the State of New York "to either institute at once adequate measures of relief and work for the unemployed of our city and State or refer the whole question back

to the President and the Congress for centralized action upon a National scale." Indorsing these resolutions, a number of men and women in the city of New York presented an appeal to the Mayor and the Board of Estimate and to the Governor and Legislature. In that appeal they presented figures which they held to be proof that there had been no such relief from the condition of unemployment as had been reported, and that in the present situation there is a menace to the peace and order of society. The signers of this statement, while supporting such reforms as the establishment of Government employment agencies, out-of-work benefits, old-age pensions, and unemployment insurance, declared that something more than these palliatives were needed, and that the people, acting through the Congress and the States, should furnish employment by the lawful exercise of the police power, the right of eminent domain, and the power of taxation to inaugurate great public works, such as road building, modern housing, irrigation and drainage projects, scientific farming, afforestation, harbor and river improvements, National electrification for power, heat, and light, and development of water power.

That the unemployment situation is still acute we do not doubt. There has been rumor mongering, due perhaps to carelessness, perhaps to propaganda, perhaps to a real but mistaken desire to help, which has resulted undoubtedly in giving many people the impression that unemployment is no longer a National problem. This is unfortunate. The President's Conference on Unemployment, which studied the problem and has done much to show the way out, has no figure-gathering agency of its own; but such figures as it has obtained indicate no such recovery as some reports have perhaps led people to believe. There has been, we have every reason to believe, a slow, steady pick-up; but no solution of the problem. According to reports from public employment agencies, in January there were 226 applicants for every hundred jobs, whereas by the middle of April there were 151 applicants for every hundred jobs. To show it in another way, out of every 100 applicants in January, 38 got employment; while by the middle of April out of every 100, 55 got employment. This, however, is not the same in all parts of the country. The reports were what is called "spotty." Still there are many more people who want work than can get it.

What should be done about it?

To imagine that a city, or a State, or the Nation can take hold of a situation like this and cure it at once, or even

within a short period, is to imagine the impossible. It is true that in times of disaster like a flood, or a fire, or an earthquake, the city that cannot help itself gets aid from the State, and the State that cannot help itself gets aid from the Nation, and relief is usually prompt and efficacious. Disasters that are thus localized, however, are not comparable to a general condition. In the one case prosperity in a part of the Nation can be drawn upon for relief of those in trouble in another part; while in the other case the difficulty lies in the lack of general prosperity and the apparent disappearance of resources on which to draw for relief. The demand to cure unemployment by levying taxes and seizing property by eminent domain does not take account of the fact that the remedy itself in that case is likely, while relieving the symptom, to aggravate the disease.

There are some cases in which the symptoms are worse than the disease. There may be times when the authorities might conceivably disregard the danger of extending an industrial depression in order to rescue its most needy victims; but such action is itself a reflection upon the intelligence of a people who allow a condition to arise which can be remedied only by making it worse.

We hope that every effort will be made to alleviate the want of those who are out of work and at the end of their resources; but we certainly hope that the effort to deal with unemployment will not end there.

To say that the National Government has done nothing in this matter, as has been said, is to do injustice to the Government of this country. It might be said that the only agency which has really done anything to deal with this problem fundamentally is the National Government. By calling the Unemployment Conference into being the President has put in motion forces which can deal with this matter if the people will support their Government and follow in practice the principles which that Conference has enunciated.

Merchants and manufacturers and men of business generally cannot shoulder this burden off upon the Government and say that they have nothing whatever to do about it themselves. If they will read the report of that Unemployment Conference, they will find that they have everything to do about it.

In the first place, so far as the use of Government agencies is concerned, these men of business, these manufacturers and merchants, have got to create a public opinion which will force municipal authorities, State Legislatures, and the

Federal Congress to make their appropriations for public works, and to authorize expenditures for public works, in such a way as to anticipate need for public employment. Under present conditions, when times are prosperous and factories are busy and production is on the upward trend, lavish appropriations for public works are made and construction is authorized so that the Government becomes a competitor of private business in seeking employees. Then when the peak is reached and there begins to be a period of hard times, appropriations are cut down, public construction is stopped, and the ills of unemployment are aggravated by the very Government that ought to alleviate them. Let these business men who are now petitioning Mayors and Governors and the President turn their attention to Congress and insist that it pass the Kenyon Bill (S. 2749). By this measure executive officers of the Government would be authorized to draw upon funds already appropriated at times when there are unemployed available for the Government to use for their benefit as well as for the benefit of the whole people.

In the second place, let these business men revise their own practices. Let them follow the principle of retrenchment before the peak of prosperity is reached, that they may have resources with which to prevent the subsequent depression. Let them follow in their own business the course that they would have the Government pursue. There are concerns whose efficiency commands general respect which are following this practice. Those who really seek to render some service in the solution of this problem of unemployment can do no better than to get from the secretary of the President's Conference on Unemployment, Washington, D. C., the report which shows the way to the proper treatment of the problem, not only by the Government, but also by private business.

BEAUTY AND THE RAILWAYS

ONE of the features of this issue of The Outlook is a group of a dozen pictures of American scenery which we have been enabled to reproduce by the courtesy of several well-known railway companies.

We do not mean to be ingracious, but we cannot resist the thought that the cult of beauty by railway builders and operators is a comparatively recent passion—a passion which it is to be hoped may develop into a steady, faithful, and even self-sacrificing love.

When railways were introduced into

England, now nearly a century ago, artists, poets, and other "damned literary fellers" opposed them bitterly as the destroyers of all landscape beauty. John Ruskin could not say enough in their despite. He had in mind the beautiful coach roads of England, lined with hedgerows, and orchards, and parklike pastures, and finely forested woodlands, and gardens; and the old-fashioned inns, with their spick-and-span courtyards and flowers and thatch-roofed outbuildings, which were the stations and stopping-places of the line. Any one who has read in "Tom Brown's School Days" the account of that young Englishman's unforgettable journey from London to Rugby on the top of a coach, or who has himself driven from Brighton to London on the old post road behind four spanking bays with a veritable Tony Weller on the box, can realize how Ruskin felt. And yet one of the most striking and beautiful of the pictures painted by Ruskin's beau-ideal, Turner, is an English railway picture. "Rain, Steam, and Speed" it was called by Turner himself—an impressionistic painting of a railway engine and train plunging through the mist across a great viaduct. It is hanging in the National Gallery in London and deserves a visit from all railway men who feel the potential and imaginative beauty of high speed and great power.

Railways have always had a great but too generally unrealized and undeveloped asset of scenic beauty. At first the idea was simply to carry the greatest loads at the least cost and the biggest profit possible. Stations were barn-like and dingy. Yards were dirty and unkempt. Cuts were ragged gashes in the earth. Embankments were a paradise of weeds. Apparently it was believed that the more hideous a bridge was, the stronger it must be. The most uninviting and repellent part of any city or village was likely to be that through which the railway ran on its way across the land.

But all this is being changed. It has been discovered that people travel not only from necessity but for pleasure, and that beauty is an essential element of pleasure. So our great railway operators have employed gifted architects to build stations and talented artists to adorn them with mural paintings. Landscape gardeners plan and beautify the station yards. Embankments are softened with grass and shrubs. Stately viaducts and carefully designed culverts are supplanting the ugly trestles and angular bridges. Section houses and signposts are harmoniously painted. And foremen of the permanent way are given prizes, not only for efficiency and safety, but for the neatness and attrac-

tiveness of the sections which are in their charge.

In George Kennan's recently published biography of Edward H. Harriman there is an interesting passage that indicates the value which that great transportation builder placed upon beauty as a railway asset:

Throughout Mr. Harriman's connection with the Union Pacific, which lasted until his death, he never ceased to improve its physical condition. He strove to make it the best as well as the most useful railroad in the West, and when, after he became president in 1904, he had brought it almost to the point of perfection as a means of transportation, he turned his attention to beautifying it.

"On one of his trips over the line," says Superintendent Park, "he noticed the lack of vegetation in and around Rock Springs, Wyoming, which, its population considered, was the best revenue-producing station on the road. 'Why don't you put in a park here?' he asked. 'The station is of attractive design, and some grass and a little shrubbery would freshen things up wonderfully.'

"A resident of Rock Springs interrupted my reply by saying: 'Mr. Harriman, there is not a sprig of grass in Rock Springs; not because we don't want it, but because the percentage of alkali in the soil is an absolute bar to its growth.'

"Mr. Harriman looked at me and said: 'Nothing is impossible.'

"Taking that for my cue, I hauled from Utah hundreds of cars of the best soil of that fertile State, distributed around the depot, planted shrubbery and trees, and to-day one of the most attractive spots on the Union Pacific Railroad is the garden surrounding Rock Springs station. This was also a cue for further work of this character all along the line. At my own personal expense I had planted trees in many localities, and had made every effort to obtain parks without the expenditure of money, because previous managements had not been willing to 'waste' money, as they termed it, in this way. Mr. Harriman was willing to spend money to make the road look attractive. The result was the beautiful park at Cheyenne, and the improvement of the landscape at all terminals, which, in a few years, transformed the Union Pacific from a road through a desert to one along which the bright green grass, trees, and flowers were in evidence at every station of importance. This movement soon spread—the section foremen began to plant trees and flowers—and now there is no other railroad so well kept, unless it be the Southern Pacific, along which Mr. Kruttschnitt had started a similar movement years before."

And so it is with special pleasure that we print this week the dozen pictures of American scenery which have been made by some of the railways as proofs of the value of their lines to the traveler. The photographs reveal, not only great natural scenic charm, but the

growing realization of railway men that they are ministers to the sense of beauty as well as to the needs of industry.

CHICAGO AROUSED

A SPECIAL correspondent in Chicago gives a clear account on another page of the facts which have led to the indictment of labor leaders charged with a conspiracy the outcome of which was a murderous assault on May 9. In it two policemen were killed, one seriously wounded, and workshops operating under Judge Landis's award as to the building dispute were bombed. One of those arrested, Fred Mader, is described as "ex-convict and President of the Chicago Buildings Trade." According to the Chicago "Journal of Commerce," Mader lately had the impudence to state before a committee of the City Council that "unless this committee takes some action that will suppress the Citizens' Committee to Enforce the Landis Award I can no longer keep my men from committing acts of violence and chasing the members of the Citizens' Committee out of the city of Chicago." The police claim that they have physical as well as moral evidence that the arrested men incited acts of violence.

Chicago is rightly stirred to action by a long series of crimes of violence, of which those growing out of the labor trouble are only a part. Lately Mayor Thompson, moved by the citizens' indignation and demand for more protection and less politics, appointed a new head of the police force, Mr. Fitzmorris, and the new chief has promised a thorough cleaning up. To Chief Fitzmorris is largely due the present war against labor thugs. He is quoted as saying: "Honest labor

union men are with us in this clean-up. They're giving us fine help." Mr. Edward W. Sims, President of the Chicago Crime Commission, declares: "Anarchists in control of Chicago labor unions have used the money subscribed by honest workmen to hire cowardly assassins to destroy life and property as a means of continuing their hold upon the unions."

A great deal has been said implying that there has been, or is to be, a stretching of the theory of criminal conspiracy in order to push these prosecutions, and they have been compared to the Haymarket attack on the Chicago police in 1886. In that case the claim was made that one or two of the men executed were not shown to have had any direct connection with the actual crime, but were convicted because of radical and Anarchistical utterances made shortly before the crime. The Judge who presided over the Haymarket trials, later wrote a magazine article of deep earnestness in which he urged that both public security and legal reasoning called for a broader interpretation of the definition of criminal conspiracy. If in the present cases the allegations of the police are sustained, there is no need whatever of any extension of the meaning of conspiracy. It never was the law that a crime must be committed by the very hands of a man charged with murder; if by threats, bribes, or persuasion he sets in motion the crime of murder, he is guilty of that offense. And that is precisely what is asserted here.

How extensive the general increase in criminal violence has been in Chicago is indicated by an editorial in the Chicago "Tribune" entitled "War on the Jungle." It asks, "Does Chicago belong to the gunman, the bomb-thrower, the

labor bully, the thug, the burglar, the divekeeper, the jury fixer, the crook in politics, the grafter, and the demagogue?" And it asserts as fact:

There is a killing for every day of the year, and murder makes a grim farce of the law. Property is destroyed with impunity. Men who would work are bullied and beaten. Officers of the law are shot down like sheep. Crime after crime goes unpunished and the hired criminal and the criminal who hires him go free.

This is not civilization. It is anarchy. If we go on, there will be no law for us but the law of the jungle.

The makers of this anarchy are rotten politics and rotten labor and the allies they have made with the human beasts that stalk the shadows of the underworld.

The problem of Chicago is, in a less degree, the problem of many large American cities. In New York City lately an assistant district attorney in a radio address pointed out the extraordinarily large percentage of quite young men among those charged with robbery and other crimes of violence, and urged that moral training in schools, churches, and homes needed extension and intensifying. The law and the courts and the police do their best to restrain and punish. But prevention lies in the implanting of higher moral standards. The non-violent citizen who profiteers or dodges taxes or oppresses the poor or piles up wealth dishonorably need not be surprised if the vicious and the hoodlum say, as one did say: "He gets his with his brains; I'm going to get mine with my hands."

The courage of Chicago in facing its crime problem should encourage decent men and women in all our cities to fight for honest and brave civic government and the defeat of crooks, gangsters, and hold-up men.

THE HUB OF EUROPE

EDITORIAL CORRESPONDENCE FROM THE GENOA CONFERENCE

BY ELBERT FRANCIS BALDWIN

IN these days in America we are apt to think of the countries of Central Europe as rather too far away to be of very much interest; as forming or reforming themselves politically; as having precarious economic conditions, with finances all upside down; as having new and largely untried means of national defense; as approving largely lopsided legislation; as lending themselves to much unnecessary squabbling with their neighbors—in short, Central Europe, to most of us, is an unsavory mess with a hopeless political outlook, and with not much power even were the outlook not hopeless.

One has but to come to Genoa, however, and see the rôle which some of these nations—above all, Czechoslovakia—are playing in the Conference to get some notion of their real power. And it is real.

The chief of the Czechoslovak delegation here is Prime Minister Edouard Benes, who is also Minister of Foreign Affairs. As I talked with him in his study this morning, he seemed no typical Slav—mystic, brooding, unpractical, doctrinaire, not working easily with other men. Instead, a brisk, practical man of affairs met me, every part of him active and alert. He gave me his

whole attention; and often when you are talking with a Slav you are not quite sure whether he is giving you his whole attention or whether he is not considering something else at the same time. He grasped my meaning before I got to the end of my sentence. He was ready with instant appreciation of my point of view—perhaps that was because it was also his own! He understood American humor. He replied tersely to my queries, telling me much in few words.

And what he says is impressively backed up by what Czechoslovakia has already done and is doing. By her geographical position she is the center

of Europe. But by her economic, political, and moral force she has become the hub around which the wheels of Europe are now revolving (these are not the Premier's words, but are a little conceit of my own which seemed to please him). Czechoslovakia is to-day the most active and powerful center of both economic and political force in Central Europe. What do you say to a new nation which in four years has accomplished that?

Bohemia, the land where the Czech language is spoken, has had a glorious past. For sixteen hundred years the Czechs have been on the same soil. They have been cultivators of that soil. They have been industrialists and exporters. But their great glory has been in the realm of education. There was the first country of Central Europe to have a university (1368), and the martyred Jan Hus was one of its rectors. Bohemia started the Reformation a century before Luther came. Bohemia has given to the world such lights in the worlds of religion, education, science, literature, and philosophy as Jerome of Prague, Comenius, Kepler, Tycho Brahe, Palacky, and now Masaryk, philosopher, political leader, and President of the Czechoslovak Republic.

And what does not the contemporary world of art in general and music in particular owe to such composers as Smetana, Dvorak, Fibich, and Suk, and to such virtuosi as Kubelik, Kocian, and Madame Ema Destinnova?

For centuries Bohemia had been ground down under Hapsburg rule from Vienna. In 1914 the World War came. Without firing a shot, Czech regiments repeatedly surrendered to the Russians and the Italians as their deliverers, and themselves formed legions to fight Austria-Hungary on the Entente side. Under Masaryk's leadership they waged such a political and military campaign against Austria-Hungary that the Allies recognized their claim to independence.

In obtaining her independence and unity Italy had her Mazzini, Garibaldi, Cavour. History may give equal honor to Masaryk, Stefanik, Benes.

Czechoslovakia numbers nearly 14,000,000 people. The natural resources of the country make it one of the richest in Europe. It possesses every useful mineral save platinum. Its forest wealth is enormous, a third of the total area being covered with forests. It is the only European country which exports sugar. Its glass and textile and beer industries are world-famous.

With these advantages and a sound financial system, Czechoslovakia is fairly unique among the countries of Europe in having a budget where revenues and expenditures balance each other. But Czechoslovakia does even better than that. She actually has a balance to the good.

Such a country can propose to borrow \$50,000,000, as Czechoslovakia did the other day, and have it covered in twenty-four hours—as it was.

Hence, with justified if characteristically modest pride, the Premier said to me: "We have taken all necessary measures to be the first among European states to pay interest on our war debt to America."

With her up-to-date parliamentary and judicial systems, her standing army of 150,000 men, her advanced social legislation (labor reforms, compulsory education, housing, pensions, accident, sickness, and maternity insurance), Czechoslovakia stands in the forefront of progressive nations.

As is appropriate, when one considers the past, religious liberty is spreading in Czechoslovakia. During the past four years about a million persons have left the Roman Catholic Church. Most of them have joined the newly formed National Church, which is largely the result of a demand for reforms by a considerable section of the priesthood. They demanded the abolition of celibacy, the introduction of the vernacular into the services, and a more democratic administration of ecclesiastical affairs. The National Church is now negotiating for recognition by and co-operation with the Anglican and other churches.

Each summer for several years I spent some weeks in Carlsbad, Bohemia, now part of the greater Bohemia or Czechoslovakia. Carlsbad is situated in the north, just south of the German mountain boundary. The region, inhabited by some 3,000,000 Germans, comprises about a seventh of the area of Bohemia proper, but representing, it was then said, about six-sevenths of the wealth of Bohemia. In talking with the manufacturers of glass and porcelain in the near-by towns, I often asked if they would not rather be German instead of Austrian subjects. The invariable reply was that, though Austria might oppress Bohemia, they, the Germans, were content to remain as they were. If the Germans in Bohemia were content then, they ought to be more content now. The burdens of Czechoslovak military service and taxes are not so great as in Germany, while the system of proportional representation assures the Germans of due weight in the Parliament at Prague, where German, Magyar, and other Deputies sit alongside the Czechs and Slovaks.

Of course, however, the Czechoslovak Government has to be on its guard against Pan-German propaganda, just as do the Polish, Rumanian, Hungarian, Austrian, and Yugoslav Governments.

Czechoslovakia is not only in itself the center of Europe, but also in its influence on the other countries of that part of the world. No one has done anything like as much to emphasize this as has Edouard Benes. He has formed the so-called Little Entente. It is really a Large Entente. It is an alliance among Czechoslovakia, Rumania, and Yugoslavia, to which alliance Poland is now becoming increasingly an ally. The alliance has already assured betterment

to Czechoslovakia, greater stability and peace to all the signatory states, and, through them, to Europe.

There is necessity to constitute in Central Europe a system of states, not necessarily having common institutions, but with a defined system of collaboration based on special treaties. Precisely this now exists. Into this Entente, despite present differences, the force of economic law will, I am sure, one day compel Austria and Hungary to come. Indeed, Mr. Benes has already concluded a special treaty with the Austrian Foreign Minister, and since then the relations between Prague and Vienna have been more cordial than they were during the centuries of Hapsburg rule.

But Mr. Benes has had also another ideal. He may, right here at Genoa, be close to its realization. Ever since the Washington Conference the dream of Mr. Lloyd George has been to accomplish here, if it can be done, something similar to the Four-Power Treaty for the Pacific negotiated at Washington. Hence, proceeding from one of the resolutions adopted at the Conference of Cannes last winter, providing for non-aggression, Mr. Lloyd George is now endeavoring to put the Conference of Genoa on record in the same respect. In other words, the nations would agree to abstain from attacking one another.

As to this there are two views about bringing any pact-breaker to terms. One view is that there should be an international military court and force; the other, that the assessment of blame should come from swift-working judicial machinery.

The main difficulty with the whole plan is that some of the boundaries along the Russian western frontier are not yet authoritatively and definitely fixed. Another difficulty may be in obtaining the assent of France to abstain from exercising her military sanctions in order to obtain the execution of the Versailles Treaty. But neither of these objections is insuperable. Mr. Benes said to me: "A non-aggression pact should respect all the international engagements existing among the signatory states. It would reinforce the League of Nations. It would surely be a guaranty of peace in Europe. A long time ago I said that a pact uniting the principal Entente allies to the Little Entente would be the best, perhaps the only, guaranty of European order resulting from the Treaty of Versailles and the other treaties."

Mr. Lloyd George's proposed text met a French counter-proposition. Mr. Benes has provided a text which, he told me, had now the approval of the heads both of the British and French delegates. If it gets the approval of the Conference, it should be known, I think, as the Benes Treaty.

Who says that Czechoslovakia is not the hub of Europe?

Genoa, April 29, 1922.

BLINDMAN

BY LESLIE NELSON JENNINGS

BLOW out a candle in a Gothic room—
I will know velvet still;
I need not only eyes for a hedge in bloom,
For water under a hill!

Say, is it April of another year?
Say, do the birds fly south?
What is the darkness when I have the clear,
Brave music of your mouth!

Beauty may perish in a thousand things,
Veiled eyes no longer see;
But what is blindness when a brown thrush sings,
And love comes home to me!

LABOR LEADERS INDICTED FOR CONSPIRACY TO MURDER

SPECIAL CHICAGO CORRESPONDENCE FROM GEORGE C. SIKES

CHICAGO is forced to deal with another labor war attended by outbreaks of violence that recall the disturbances of 1886, as a result of which Anarchist leaders were hanged on account of the killing of policemen by bomb explosions in Haymarket Square. On the evening of Tuesday, May 9, two policemen on strike duty were murdered. At the time this was written the actual perpetrators of the crime had not been discovered. But public authorities, applying the principles of law utilized successfully in the Anarchist trials, are proceeding to prosecute certain labor leaders for murder, on the charge that they are responsible for the slaughter of the policemen.

The trouble developed out of controversies between workers and employers in the building trades. Most of the wage-scale agreements expired in May of last year. The employers asked for reductions in wages. Judge Landis was selected as arbitrator. He not only made moderate wage reductions, but ordered important changes in working practices, hitting particularly practices considered hostile to the public welfare. The workers said these matters were not submitted to arbitration. Judge Landis also stipulated that the wage scale fixed should be treated as the maximum as well as the minimum. It is usual, in theory at least, to regard union scales, whether fixed by agreement or by arbitration, as minimums only. There are thirty-two unions in the Chicago Building Trades Council. After discussion and some protest, twenty of these unions decided to accept the Landis award, and are working under it, on the closed-shop basis. Twelve unions have refused to recognize the Landis award. Of these, the painters, with a hang-over contract, were not a party to the arbitration. The carpenters' union, with the largest membership of any single building trades organization, had withdrawn from the arbitration proceedings before the result was announced because of knowledge that Judge Landis intended to modify working rules. The number of workers

in the twelve unions that refused to accept the Landis award is larger than the number in the twenty unions working under the award.

When it appeared that many of the building trades unions were to defy the Landis findings, there was formed the Citizens' Committee for the Enforcement of the Landis Award, backed by leading business interests of the community and well supplied with funds. As to unions that had accepted the award the closed-shop policy was continued, except that workers in these organizations were obliged to work with non-union men of other crafts not under the award. The open-shop policy was announced for the twelve trades the unions in which refused to be bound by the rulings of Judge Landis, and the Citizens' Committee vigorously undertook to help find workers for contractors operating under the Landis award.

At the time of the announcement of the Landis award the principal officials of the Building Trades Council were in favor of accepting it, despite dissatisfaction with some of its features. But these officials soon stepped aside, in part at least on account of scandals not related to this particular matter. Shortly thereafter Fred Mader, an ex-convict, became President of the Building Trades Council. He undertook to wage a vigorous warfare against the Landis award, assisted by two labor leaders not hitherto identified with the Building Trades Council and not connected directly with any union represented in the Council. One of these men, Timothy D. (Big Tim) Murphy, is now under sentence to serve six years in a Federal penitentiary for instigating a bold daylight robbery of the United States mails at the Dearborn railway station in Chicago in April, 1921. The amount stolen was \$350,000. The technical charge against Murphy was conspiracy to aid the robbery. He was not accused of participating in it personally. The sentence was imposed by Judge Landis before he resigned from the Federal bench. Murphy has been out on bail pending the

review of his case by the higher courts. He is a picturesque character of the dare-devil type. He was brought up in the Chicago stockyards district. As a newsboy he sold papers to P. D. Armour. He has been active in politics, having served one term as Representative in the Illinois Legislature. Some years ago Murphy was indicted on the charge of murdering a rival labor leader, "Moss" Enright, also with a reputation as a gunman. When the case finally came to trial, the principal witnesses had disappeared and the prosecution had to be abandoned for that reason. The other conspicuous labor leader associated with Mader is Cornelius P. (Con) Shea, who figured prominently in a Chicago teamsters' strike some years ago which was attended with much violence. Since then Shea has served a term in Sing Sing penitentiary, New York, for brutal treatment of a woman companion.

Since Mader took the presidency of the Building Trades Council crimes of violence against plants operating under the Landis award have been frequent. There have been about twenty bombings and many sluggings. Matters reached a crisis on May 9. Thomas Clark, a policeman, had been assigned to guard a particular plant. When he started to question four men who drove up in an auto, he was shot and killed. A little later the same evening three West Park policemen tried to stop a suspicious-looking car—presumably the same one—when the occupants of the car opened fire. Acting Lieutenant Lyons was killed and the two others wounded.

At a special meeting of the May grand jury, held May 11, indictments for murder were voted against Mader, Murphy, Shea, and five others. It is not contended that Mader, Murphy, or Shea actually did the killing, but they are charged with responsibility for the murders. It is announced that the prosecution of the cases will be pushed speedily.

The community is greatly aroused over the latest turn of affairs in the building trades labor war.

BEYOND THE BOULEVARDS

THERE LIES THE
SCENERY, AND
ANY AUTOMOBILE
CAN REACH IT

BY

FRANK A. WAUGH

AUTOMOBILISTS are classified in the popular mind and with the garage-keepers according to the price of their cars. A much better system of classification, and one which goes to the very roots of character, might be based on the roads which they frequent.

In this analysis there are three kinds of automobile users; observe them carefully. The first we may call Birds of the Boulevard, for they never get beyond the parkways. The second group shall be known as Macadam Hounds, for it is their ambition to devour every Sunday the maximum mileage of good State road, but nothing under the smiling zenith of heaven could tempt them off the stone turnpike. Then there is the third class, whom we will describe as Lovers of the Landscape, for they use gasoline as a means of getting out to nature. They love the woods and the fields, they linger and worship there. These are the automobilists whom I would like to honor, for they seem to have some sense. It would be a contribution to public education and National welfare if we could convert a few thousands of those Birds of the Boulevard and the Macadam Hounds to the ranks of honest Lovers of the Landscape.

Popular theory has it that all automobile users, excepting only truck drivers and bootleggers, go out to see the landscape. There is a presumption in favor of this hypothesis. For we can readily believe that if all automobile roads were subways, with no outlook upon green grass or trees and no uplook to the sky, there would be very little pleasure driving. At present the amount of this luxury driving runs up to about fifty billion miles a year in this little dominion ruled over by Congress and the Legislature and the Board of Aldermen. It would really seem as though everybody was getting a long slice of the good landscape.

But if it is long, it is exceedingly thin. In a car moving forty-five miles an hour over good State roads the view of the scenery is decidedly superficial. About all one can really grasp is the billboards, because they have been carefully located in the most legible spots. The driver certainly has to keep his attention at full capacity on his driving, and the other occupants of the car have to watch the driver to see that he does not waver or relax. My friend and fellow scold,

THROUGH THE BIG WOODS IN WASHINGTON STATE

THE PICNIC GROUNDS AT THE END OF THE ROAD

Mr. George Ade, has recently given these Macadam Fiends the benefit of his scathings. He says he has located his private golf course beside the State highway so as to secure the utmost privacy. Nobody going by in a motor car, he says, can bring his vision down to see so small an object as a golf links.

All of which loses every color of exaggeration when comparison is made with the sweet and delectable scenes enjoyed by the real Lovers of the Landscape, those who use their automobiles to take them where the grass is green, where the woods are shadowy, where the wild birds nest, and who are satisfied to linger and loiter and delight in the world's best when they get there.

Two considerations should be urged against the stupid practices of the Boulevarders and the State Roaders, all of whom might get a great deal more satisfaction out of their gasoline consumption if they would learn new and better ways. And first is the fact that the little side roads are much easier to negotiate than they imagine; and second is the complementary fact that the scenery of these little byways is much more delightful than they have ever known. Both these facts are easily demonstrable, and, while experience is the best teacher, some data can be submitted here to support this argument.

The modern automobile of course is a very capable machine—certainly the most thoroughly adequate machine ever built for general use. It has everything but intelligence, and at times I have been wont to think that such and such a machine knew more than its driver. If the man at the wheel will only supply the brains, a good automobile will always do the rest. It will go anywhere. Last summer a courageous young man drove one down into the Grand Canyon and out again. I have more than once sat beside a driver who would send his car anywhere that a span of horses and a buckboard would dare to climb.

Yet this stuntsy driving is nowhere necessary on the little country roads. Their only shortcoming in most cases is the lack of macadam. They are "hard dirt roads," according to the technical description. Even when one goes the practicable limit and gets out into the woods roads of New Hampshire or North Carolina or Michigan, all one has to do is to avoid muddy weather and drive slowly.

Drive slowly, in fact, is the key to the whole combination. One has to reduce speed as the road roughens and narrows; but if one will drive carefully and intelligently he can do just as well in the woods roads of the Adirondacks as on the boulevards of Washington. In fact, the driving on the back lanes is safer and easier. The trouble is that hundreds of thousands of poor, half-educated motorists think there is something wholly wrong when the speedometer falls below the 35 mark. They can't imagine themselves going ten or

fifteen miles an hour unless the car is lame.

Yet a speed of fifteen miles an hour will get any reasonably good driver into unmeasured worlds of landscape beauty—realms never seen by the average motorist, scenes of constant delight. Of course the hunters and the fishermen and a few such enthusiasts know all about this thing, and those few amiable motorists of the third class, the natural-born Lovers of the Landscape. Others ought to learn how to drive.

When one stops to consider, it is almost a matter of logical necessity that the best scenery should congregate along the little roads. Where the highway runs level and straight along the broad valleys there run also the railways; on those roads the freight-truck traffic blocks the way and raises clouds of dust; on those roads are poles and wires and billboards; there are the

towns, the necessary garages, the noise. But on the back roads, winding in and out, up and down, there are the pictures. That kind of a road is full of pictorial compositions. One may lash his kodak to the radiator and snap it at random, and every snapshot will show a pretty landscape. On those back roads are the picturesque old farm buildings, the homely fields, the rolling pastures, the cool woods, the singing brooks. It is characteristic of the topography in inhabited hill country that the side roads climb up and down by the watercourses. Thus we keep company on our travels with every clean and musical brook which the country affords.

Each brook is a story in itself, like a 300-page novel, only more natural and wholesome and better illustrated. In the opening chapters one finds sweet cool springs, then little rivulets seeping out of sphagnum ponds, then dancing little waterfalls, next shady reaches where the trout wait, lower down mill-ponds with a spray of water falling over dams, then broader slower stretches fit for the canoe, and finally the waters of our brook join the great river and flow happily ever after.

In the same way every old farm has its story to tell; and the woodlands modestly ask us to loiter and listen to them. Oh, there is endless romance and delight if we only go where they are and move slowly and quietly enough to hear. If we thunder along at fifty miles an hour, we shall of course hear nothing but the whirr of the engine and the knocking of cylinder No. 5 where the tappet-rod is loose.

It is impossible to say enough for the beauty of our American scenery. Everywhere are landscape pictures incomparably superior to the painted landscapes in the art museums of Europe. Whether on the plains of Texas, the deserts of Arizona, the mountains of Montana, or the wheat fields of Dakota, there are beauty and inspiration for all. Only one has to open one's eyes, one's mind, and one's heart to see such things. The modern motor car was sent from heaven primarily to make all these glories accessible to Americans. From this highly defensible point of view the automobile is the first ally of civilization. Let us use it as such. We need not renounce our long trips via the Santa Fé Trail or the Lincoln Highway; but for most of us, with the short hours at our command, the near-by country roads are our main reliance. And so, if we will have the courage to get off the beaten highway, our sturdy automobiles are quite ready to take us to quiet, unexplored and unexpectedly beautiful scenes along the little country lanes. All we need to do is to learn a new and leisurely way of driving. By slowing down, relaxing our tense nerves, and by taking life and the landscape a little easier we shall profit largely. In fact, we shall have discovered a new and higher use for our automobiles.

THE OUTLOOK reaches out week by week for writers who speak with authority on matters of National and international import. Each number is planned to meet the needs of those who wish the best and most readable presentation of the problems and interests of the hour against the background of a searching understanding of history and literature. This is one of the reasons why The Outlook cannot announce long in advance of publication the names of many of its most eminent contributors.

Sometimes we can tell our readers of a few good things in store for them. Here are a few of the articles awaiting publication:

GLoucester town—where the fishing fleets put in

GLoucester—OFFSHORE

BY HAROLD T. PULSIFER

I HAVE come back to the office from a day in a shipyard—a yard that harbors for the winter a hundred craft or more. There bright mahogany motor yachts are neighbors to trim white sloops. Spoon bows and clipper bows, straight stems and stems that once were straight, vessels whose paint bespeaks their perfection and vessels whose paint is, to the careful observer, but a transparent attempt to conceal the ravages of time—there is room for them all as they lie waiting their turn to put to sea. There is room for them all, even for the plainly finished sailing vessel within whose black and beamy hull I make my summer home.

As I sat in her cockpit and watched her decks brighten under the ministrations of varnish, as I worked over the coils of her running rigging, laying open the strands here and there to test for signs of decay, as I watched the clean shavings fall from the new spar destined to replace a badly sprung main-gaff, I lost myself, as I have often done, in the philosophy of shipyards, of ships, and of recreation.

We sometimes talk of recreation as though it were a discovery of our own time. The craft that sail the seven seas must laugh at such presumption. They not only discovered recreation long ago, but simultaneously they must have discovered its real meaning. Most of us poor landlubbers think of recreation as a synonym for pleasure and amusement. As any ship will tell you, recreation time is a re-creation time—a time to survey your timbers, a time to cut out

dry rot, a time to test your rigging, a time to overhaul your spars.

The trouble with us mariners of life is that there are very few able seamen among us, men who can tell when a rope is overstrained, men who know straight grain from crooked, men who can tell at a glance sound wood from painted putty. If we were all able seamen, we would know the real meaning of recreation—re-creation not only of our physical selves but also of that intangible reality which has been the despair of philosophers and theologians to define since the days of the first tremulous "why." Whether one be a follower of Berkeley or William James, whether one turn to St. Paul or the precepts of the Friends, whether one looks back to Sinai or forward to a New Jerusalem, the need is always the same. To re-create, we must first survey. We must search out for our own selves the existence of those fundamental principles upon which the structure of faith and society has been reared. The more elemental those principles, the more incontrovertible we will discover them to be and the surer our foundations will stand.

It is hard sometimes to get back to the elemental in the confusion and tumult of our daily lives. The mind exhausts itself in labor (to desert sea comparisons for land) like the field which is continuously and unwisely tilled. A fallow time is needed for re-creation and understanding.

Some find this time of re-creation in the silences of the dark woods, some in the aloofness of great crowds, some be-

side the eternal march of clear brown waters toward the sea—I find it most surely on the salt waves to which those sweet waters are eternally hurrying.

It was in late August of last year that I set sail from Martha's Vineyard, even before the sun rose out of the Atlantic, for the long run around Cape Cod. Fair winds and fair tides carried me to the end of the Cape by the late afternoon. We rounded the tip and laid our course for Gloucester, forty miles, if I remember rightly, across the mouth of Massachusetts Bay. While the sun was still above the horizon, I went below and brought up a poem which has moved many who have never even felt the breath of salt air in their lungs—William Vaughn Moody's "Gloucester Moors." It was towards

(Gloucester town

Where the fishing fleets put in

that our course was laid—Gloucester town from whose boulder-strewn hill-sides generations of my name had eked a living and from whose harbor men of my blood had set out to farm the sea and bear its fruit in triumph to the forbidding shores of Cape Ann.

The breeze freshened and the seas from the bay lent an added force to Moody's unforgettable comparison:

This earth is not the steadfast place
We landsmen build upon;
From deep to deep she varies pace,
And while she comes is gone.
Beneath my feet I feel
Her smooth bulk heave and dip;
With velvet plunge and soft upreel

Mr. George Ade, has recently given these Macadam Fiends the benefit of his scathings. He says he has located his private golf course beside the State highway so as to secure the utmost privacy. Nobody going by in a motor car, he says, can bring his vision down to see so small an object as a golf links.

All of which loses every color of exaggeration when comparison is made with the sweet and delectable scenes enjoyed by the real Lovers of the Landscape, those who use their automobiles to take them where the grass is green, where the woods are shadowy, where the wild birds nest, and who are satisfied to linger and loiter and delight in the world's best when they get there.

Two considerations should be urged against the stupid practices of the Boulevarders and the State Roaders, all of whom might get a great deal more satisfaction out of their gasoline consumption if they would learn new and better ways. And first is the fact that the little side roads are much easier to negotiate than they imagine; and second is the complementary fact that the scenery of these little byways is much more delightful than they have ever known. Both these facts are easily demonstrable, and, while experience is the best teacher, some data can be submitted here to support this argument.

The modern automobile of course is a very capable machine—certainly the most thoroughly adequate machine ever built for general use. It has everything but intelligence, and at times I have been wont to think that such and such a machine knew more than its driver. If the man at the wheel will only supply the brains, a good automobile will always do the rest. It will go anywhere. All we need to do is to learn a new and leisurely way of driving. By slowing down, relaxing our tense nerves, and by taking life and the landscape a little easier we shall profit largely. In fact, we shall have discovered a new and higher use for our automobiles.

THE OUTLOOK reaches out week by week for writers who speak with authority on matters of National and international import. Each number is planned to meet the needs of those who wish the best and most readable presentation of the problems and interests of the hour against the background of a searching understanding of history and literature. This is one of the reasons why The Outlook cannot announce long in advance of publication the names of many of its most eminent contributors.

Sometimes we can tell our readers of a few good things in store for them. Here are a few of the articles awaiting publication:

Immigration and Naturalization

GLoucester town—where the fishing fleets put in

GLoucester—OFFSHORE

BY HAROLD T. PULSIFER

I HAVE come back to the office from a day in a shipyard—a yard that harbors for the winter a hundred craft or more. There bright mahogany motor yachts are neighbors to trim white sloops. Spoon bows and clipper bows, straight stems and stems that once were straight, vessels whose paint bespeaks their perfection and vessels whose paint is, to the careful observer, but a transparent attempt to conceal the ravages of time—there is room for them all as they lie waiting their turn to put to sea. There is room for them all, even for the plainly finished sailing vessel within whose black and beamy hull I make my summer home.

As I sat in her cockpit and watched her decks brighten under the ministrations of varnish, as I worked over the coils of her running rigging, laying open the strands here and there to test for signs of decay, as I watched the clean shavings fall from the new spar destined to replace a badly sprung main-gaff, I lost myself, as I have often done, in the philosophy of shipyards, of ships, and of recreation.

We sometimes talk of recreation as though it were a discovery of our own time. The craft that sail the seven seas must laugh at such presumption. They not only discovered recreation long ago, but simultaneously they must have discovered its real meaning. Most of us poor landlubbers think of recreation as a synonym for pleasure and amusement. As any ship will tell you, recreation time is a re-creation time—a time to survey your timbers, a time to cut out

dry rot, a time to test your rigging, a time to overhaul your spars.

The trouble with us mariners of life is that there are very few able seamen among us, men who can tell when a rope is overstrained, men who know straight grain from crooked, men who can tell at a glance sound wood from painted putty. If we were all able seamen, we would know the real meaning of recreation—re-creation not only of our physical selves but also of that intangible reality which has been the despair of philosophers and theologians to define since the days of the first tremulous "why." Whether one be a follower of Berkeley or William James, whether one turn to St. Paul or the precepts of the Friends, whether one looks back to Sinai or forward to a New Jerusalem, the need is always the same. To re-create, we must first survey. We must search out for our own selves the existence of those fundamental principles upon which the structure of faith and society has been reared. The more elemental those principles, the more incontrovertible we will discover them to be and the surer our foundations will stand.

It is hard sometimes to get back to the elemental in the confusion and tumult of our daily lives. The mind exhausts itself in labor (to desert sea comparisons for land) like the field which is continuously and unwisely tilled. A fallow time is needed for re-creation and understanding.

Some find this time of re-creation in the silences of the dark woods, some in the aloofness of great crowds, some be-

side the eternal march of clear brown waters toward the sea—I find it most surely on the salt waves to which those sweet waters are eternally hurrying.

It was in late August of last year that I set sail from Martha's Vineyard, even before the sun rose out of the Atlantic, for the long run around Cape Cod. Fair winds and fair tides carried me to the end of the Cape by the late afternoon. We rounded the tip and laid our course for Gloucester, forty miles, if I remember rightly, across the mouth of Massachusetts Bay. While the sun was still above the horizon, I went below and brought up a poem which has moved many who have never even felt the breath of salt air in their lungs—William Vaughn Moody's "Gloucester Moors." It was towards

Gloucester town

Where the fishing fleets put in

that our course was laid—Gloucester town from whose boulder-strewn hill-sides generations of my name had eked a living and from whose harbor men of my blood had set out to farm the sea and bear its fruit in triumph to the forbidding shores of Cape Ann.

The breeze freshened and the seas from the bay lent an added force to Moody's unforgettable comparison:

This earth is not the steadfast place
We landsmen build upon;
From deep to deep she varies pace,
And while she comes is gone.
Beneath my feet I feel
Her smooth bulk heave and dip;
With velvet plunge and soft upreel

She swings and steadies to her keel
Like a gallant, gallant ship.

SUDDENLY the light faded, and as I sat with my back to the main hatchway I noticed that the sailing master at the wheel was watching the western sky with an awakened keenness. I turned to see that the sun had disappeared in a bank of clouds, and that along the horizon gray fingers of fog were reaching out over the water.

"Looks like a bad night to make a landfall," said my sailing master. "I doubt if we can pick up Thacher's Island light."

When dusk had fallen, I went aft and took the wheel and the sailing master went forward to trim and put up the lights. When they were made fast, he stood at the fore shrouds for a while. I could not see his face, but I knew that his seaman's eyes were watching the narrowing horizon with the keenness of a soldier awaiting an expected attack.

Overhead and to the east the stars now shone clearly, but to the west there was a veil that hid them from our view. Gradually the veil grew, blotting out the heavens, star by star. There was the damp smell of fog in the air and then its breath upon our cheeks. At last the heavens vanished and the blackness closed around.

"We must be ten or fifteen miles off-shore," I said, "and we will never pick up Thacher's to-night. What do you say to shortening sail, laying an easterly course which will clear all the shoals and ledges, and then head in for Portland in the morning?"

"I was just about to suggest the same thing," said the sailing master, and he disappeared forward to carry out our plan. We had already put on our oilskins, for the fog was almost a drizzling rain. In the light of the binnacle I plotted our course, and when the sailing master had finished with his labor we were ready to bear off and set out for the open sea.

With the wind now abaft the beam, we took turns in breaking the silence of the night with three blasts upon the raucous horn which sailing vessels must carry to give warning in a fog. We speak of lights which make the darkness visible; a fog horn at sea makes the silence audible.

Our world had narrowed to a little circle of yellow light from the binnacle. Overhead the mainsail melted into the night. The sky hung a hand's breadth over our heads. To port and to starboard there was a dark suggestion of advancing and retreating waters. In the center of this hemisphere of mystery we sat in our yellow garments and listened for what the sea gods had in store.

There is no isolation like the isolation of a foggy night in a small boat on the open sea. The remote world of men and women seems like a half-remembered dream. What does it matter if out of such darkness we pass into that darkness which we cannot hope to comprehend? What does it matter if fate answers for us Hamlet's age-old ques-

tioning, "To be or not to be?" What are books, lives, hopes, fears, even love, to the inexorable darkness in which we move and have our being?

But thou, vast outbound ship of souls,
What harbor town for thee?
What shapes, when thy arriving tolls,
Shall crowd the banks to see?

Out of the night came a voice from that ship-world like an echo to our own plaintive horn:

"Whroo! Hoo! Hoo!"

We blew our three blasts and waited for the answer. The fog plays tricks with sound and it is hard to know whence it comes. Some ways to port the signal was repeated a little louder and a little nearer.

"Must be a tow out of Portsmouth," said my sailing master, "going to wester'd. Sounds like Cap'n Ferguson's tug Gladiator. He went east while we were in the Sound. He's about due to start back now."

"Whroo! Hoo! Hoo!"

This time the sound seemed to be a little abaft the beam on the port side, and closer, much closer. Philosophizings vanished at the approach of the menacing sound. I blew our horn and peered with nerves aquiver into the night.

"Whroo! Hoo! Hoo!"

The blasts fell upon our ears like the voice of the trump of doom. There was the sound of rushing waters close astern, and then directly under our counter, it seemed, the fateful blast again. We peered astern, but there was no sign. Conscious of a presence on the waters, we waited. The next signal came to starboard and less strongly. A few yards had separated us from disaster on the prow of one of the ships which pass in the night.

When even the sound of the signals had vanished, I knew that I, an atom in the vast outbound ship of souls, had found surely the answer to Hamlet's questioning—the answer which myriads of mankind had found before me. The fog-born doubt of the necessity of living was blown out of my brain as the fog itself was destined to vanish with the rising sun.

MORNING does not break after a foggy night at sea. The circle of visual perception imperceptibly widens—that is all. The sails loom more grayly, the binnacle light seems dimmer, the waves turn from velvet black to slaty green.

Overhead, with the coming of the day, the fog thinned and from an impenetrable wall changed into towering opalescent clouds. The blue sky broke through and then the fog rose from the water until our world became again a great ring bound by the sky and the sea. Only now and then did a mountain barrier of mist bar our path over the waters, threatening to engulf us as we headed in for the land. Sometimes we sailed into these mountain barriers and out into sunlight on the other side. Sometimes they lifted in a gigantic arch of impalpable mist through which we

passed like magicians triumphing by sorcery over natural powers.

We had gone far to sea in the night, for there is more safety in open waters than in narrower channels where tides and rocks compete for the mastery of man. So it was many hours before the far blue coast-line lifted from the horizon.

Scattering wide or blown in ranks,
Yellow and white and brown,
Boats and boats from the fishing
banks
Come home to Gloucester town.
There is cash to purse and spend,
There are wives to be embraced,
Hearts to borrow and hearts to lend,
And hearts to take and keep to the
end,—
O little sails, make haste!

In that moment there was an answer to a doubt which even the night had not dispelled. To be? To be is not enough. The mystery of wild geranium and scarlet tanager; the stout hearts to which Cape Ann has given birth; the scattered fleets from Gloucester town, must have some other answer than the command "to be." Homes and ships

And hearts to take and keep to the
end,—

come only from the call "create!"

Be and create. The mystery of those words, unspoken sometimes, but always felt and inwardly understood, has turned the barren hillsides of Cape Ann into farm lands and the dwelling-places of man; it has carved the trunks of trees and set them afloat on the rivers of the world; it has changed those crude craft into lofty ships with a beauty which is close to tears; it has torn iron from the earth and bent it to our will. It has lifted the very water out of the sea and forced it to carry our vessels to far lands.

On the face of the dangerous blue
The star fleets tack and wheel and
veer,
But on, but on does the old earth
steer
As if her port she knew.

God, dear God! does she know her
port,
Though she goes so far about?
Or blind astray, does she make her
sport
To brazen and chance it out?

We know the port for which she sails, though the strange seas through which she passes are to us all, at times, a bewilderment and a despair. On the way to the mysterious beauty which it is in us to create there lie many dangers ahead and many rocks behind. There have been false makers of charts and treacherous captains enough. There will be false makers of charts and treacherous captains until the end of the voyage. But whether we live below the "battered hatch" or our hands are on the wheel, there are stars in the heaven whereby our courses may be laid. Make, if you will, a thousand sects and a thousand philosophies, there are some things that we know, as we know that we breathe.

ANGKOR VAT, ONE OF THE MIGHTIEST STRUCTURES EVER BUILT UPON THE EARTH

NEW PÉLERINS D'ANGKOR

BY LOUIS V. LEDOUX

"... *des vrais cochons; Nom de Dieu!*" THAT is the end of what our Breton captain said about his deck passengers—Chinese, Annamite, Cambodian—before we left the harbor of Saigon on what appeared to be a wild attempt to reach, in the off season, those mighty ruins of Angkor—four hundred miles to the north—which lay lost through the centuries in the forests of Siam and have been taken over recently by the French. There were four in our party—"*des Américains vraiment fous.*" as we happened to overhear; and our troubles had commenced some days earlier when we had been careless enough to arrive in the torrid capital of Cochin-China at an hour when the Chinese *concierge* of the hotel was taking his siesta and left us, by consequence, to land with our baggage in the midst of a mob of natives in loin cloths who were fluent enough in their own language and totally ignorant of any other.

But when at last the *concierge* arose, rotund and smiling, from his slumbers to tell us that the service to Angkor had been suddenly suspended three days before and would not be resumed until after the next season's rains, gloom enwrapped us. We decided, *faute de*

mieux, to push on as far as Phnom-Penh, the capital of Cambodia, which could be reached easily by steamer up the lower Mekhong, and make further inquiries there.

The next day was passed in a fruitless quest for further information, but in the evening we were delighted to learn that a friend of the hotel proprietor's could arrange to have us motored from Phnom-Penh to the village of Kompong-Luong des Lacs, from which we could make in seven hours a diagonal of seventy-five miles across the end of the great lake in a Government motor boat which could be rented for us.

On the following evening the steamer of the Breton captain was scheduled to leave for Phnom-Penh at nine, and while the men of our party were seeing off the baggage and the two ladies finishing their after-dinner chicory, the proprietor led up to our table a Frenchwoman whom we will call for the sake of brevity simply "Madame," and explained that the lady was another particular friend of his who, having lived in Saigon for fifteen years without ever visiting Angkor, had decided to take this excellent opportunity and come with us. There was no help for it and she came.

That evening on the boat while our ladies were getting ready for bed my friend and I sat out on deck in our pajamas, while Madame, who would have been a model for Rubens, undressed in candle-light with her door open, and then paraded about us, as she did again the next morning, in transparent scarlet chiffon and curl-papers. Finally it came our turn to go to bed, but none of the four could sleep until Madame, on the other side of a thin partition, had finished explaining exhaustively to her colonial compatriots that all Americans were mad, anyway, and that she had decided to come with us only so as to spite her husband—facts that we were interested to learn.

THE tropical sunrise woke us when the Southern Cross had scarcely faded in the sky, and all that day we were going up the great river, sometimes far out in the stream and sometimes, in spite of the low water, so close to shore that we could see clearly the many-colored birds, the strange foliage, and the quaint houses. The sunset was golden behind great palm trees, and when we woke again we were at Phnom-Penh with proprietor's friend number

THE GRAVEN RECORD OF AN ANCIENT DANCE

one waiting to meet us and number two at our side.

On the following morning before there was pink in the east we started down the straight, French road with one headlight working, the Cambodian chauffeur, who spoke no French, driving as if the devil were after him and the Cambodian *mécanicien* holding the machine together with both hands and one foot. When the sun rose, the road stretched straight ahead of us through jungle, fields, and swamp. We sped on until 10:30, when we reached a few desolate fishermen's huts, where we transferred to *sampans*, the Sisophon, the *chaloûpe* which was to take us across the lake, being unable to come in to shore.

We sailed out into the great lake, without a compass, but guided, I suppose, by the occasional stretches of submerged forest which showed on the horizon and, for a while, by distant hills; and, trusting in Providence, we came well before sunset within reach of the opposite shore.

Then we transferred to a *sampan* propelled by larger people than those we had seen farther south. The faces were kindly and the dark muscular bodies like moving bronze. The costume con-

sisted of a cotton cloth draped like a skirt which hung from the waist to the knee and was gathered in a knot in front. The barbaric designs in these cotton cloths we greatly admired as fine examples of native workmanship

until, on closer examination, we discovered the printed words "Made in Manchester."

At the landing, just at sunset, we found a motor truck to take us the final twenty miles to Angkor.

Of all the picturesque things we had seen until then there was nothing that approached that ride in picturesqueness. The road was a sort of dike through the swamps, bordered with huge trees of a kind we had not observed before, whose smooth trunks rose straight and gigantic into the darkness like the trees of California.

We knew that the little French bungalow in which we passed the night faced Angkor-Vat, the great temple which is the best preserved of all the ruins and one of the mightiest, most elaborate structures ever built upon the earth; and the following morning, when the first light was coming into the east and Madame was quieted in sleep, the other six of us went out to the terrace to see the sun rise behind those strange, titanic towers left desolate ages ago by a people vanished from the earth.

BEFORE us was a great moat filled with nenuphars and purple water hyacinths; across that stretched a causeway of huge gray slabs of stone with parapets shaped like colossal cobras rearing massive hoods on each of which were sculptured seven heads, this peculiar form of decoration being called, after the Hindu snake god, a "Naga." Beyond the causeway and the moat were gray, interminable galleries, the side toward us upheld by columns, and the other side, as we knew, bearing on every inch the sculptured records of old wars. Back of the gallery, their bases hidden by it, rose the towers of the far-off inner temple, huge masses of stone built into a shape unknown elsewhere, I believe, and possibly phallic in origin. Beside us and behind us stretched interminable forests filled with birds.

We lingered long on the terrace, robed

ANGKOR VAT, SOUTHERN SIDE

in our dressing-gowns and pajamas, and when we finally came to breakfast Madame had wandered off alone to see the sights.

As for us, we went down the great causeway, up a brief flight of stone steps, and through the portico of the sculptured gallery, to see stretching ahead of us, far and gray, another massive causeway twice the length of the first. At the farther end rose another flight of stone steps twice the height, and beyond that the central courtyard, flanked with four great towers, in the midst of which rose a third steep flight double the height of the second and leading to what was the inner sanctuary immediately under the fifth and greatest of the towers.

Once every foot of that mountain of stone which is Angkor-Vat had been covered with carving—innumerable Ap-sâras, sculptured stories from the Ramayana; Vishnu, Shiva, with the other gods of the Brahman Pantheon, and around them all delicate traceries of intricate, ever-varying design, panels that suggested now the French Renaissance, now the Alhambra, and now the patterns of Chinese or Indian craftsmen. Once in the inner sanctuary sat Brahma himself enthroned, looking out across the forest to that lost city of Angkor-Thom, which could easily have held within its walls the Rome of Nero. Then came Buddhism—slow, insinuating, making converts, if the theories of archæologists are correct, of the million slaves who served the Khmer lords; then (who knows when?) a sudden rebellion—the Buddhist slaves against the Brahman masters—an orgy of willful destruction, the placing of Buddhist images in the shrines, a period of swift decay during which a Chinese traveler came to see the golden lotus of Gautama surmounting the great gray towers of the harsher cult, and to leave the only known record of what Angkor was. After that the forests reclaimed their own; a few Buddhist monks lingered on in Angkor-Vat through the generations, keeping that in somewhat better preservation than the fallen palaces and the other temples, where great trees pushed upward and outward through the masonry and rose sometimes with their billowing green from the very tops of the towers.

In 1907 the French took it from Siam, and since then, with the perfect genius of their race, trees have been taken down in sections, inch by inch, fallen stones have been placed upright again, the forest has been pushed back from Angkor-Vat, and now slowly, week by week, the other monuments of that great vanished empire are being discovered and re-established; the swift destruction caused by man and the slow destruction of the centuries being overcome by imagination and patient labor.

All that afternoon and the following morning M. Goloubew, one of the archæologists in charge, went with us, showing us the extraordinary temple of Bayon, where the enormous heads of

A STRANGE SUGGESTION OF THE FRENCH RENAISSANCE APPEARS IN THIS PANEL FOUND IN THE HEART OF AN EASTERN JUNGLE

Brahma, with their strange smile, have been so massive as to survive all attempts at destruction, the work that had been done in recent years; and, most fascinating of all, leading us out to places that were just being uncovered, where the ground was literally strewn with fragments of old bronze and pottery, and where just before he had picked up in the grasses an undamaged bronze figurine. All of us would have been ready to enlist under him with picks and shovels; for we walked among fallen statues only half buried and knew what a treasure was beneath our feet. In fact, M. Goloubew would be an ideal person under whom to work, for his imagination had recreated and could picture for us the vanished life as Flaubert did that of Carthage, and he is, besides, a trained archæologist who once served his apprenticeship in the caves of Ajanta and is familiar with life in the jungle.

But how describe Ta Prom? Most of the roofs were gone; gigantic trees shot up among the statues and the carved columns, stretching huge octopus roots over fallen gods and tumbled colonnades; whole pillars, even whole door-

ways and bulks of masonry, would sometimes be surrounded and held upright by one of these strange, banyan-like trees, the native name for which is *spong*. Parts of Ta Prom are erect in their old positions with the arabesques of their pillars unspoiled, the Ap-sâras and snake goddesses still in their places; other parts are a mass of fallen monoliths under which panthers lurk through the daytime, and over all are the great smooth-trunked trees filled with innumerable birds of brilliant plumage, and large, long-tailed monkeys making incredible leaps among the branches.

Pompeii is small and unimpressive compared with Angkor, and farther in the jungle are oases of romance to some of which we went by bullock-cart and elephant—places of utter ruin that cannot be described here.

One thing, however, I must attempt to describe. We had heard that the *indigènes* had curious traditional dances, and an evening at the native theater in Phnom-Penh having increased our interest, we summoned the Elder of the village, a person of apparently fabulous age, who knew the old words and mo-

STEPS IN A DANCE WHICH SURVIVED CENTURIES OF DESOLATION

tions of the dances and had taught them in his turn to those who now are young. Through him arrangements were made, the news was spread about the countryside, and on the appointed evening we had the privilege of witnessing a spectacle of surpassing strangeness and beauty. By the time darkness set in two or three hundred shadowy figures were crouching outside our little hotel. When we were ready, torches were lighted, a long procession was formed with us in the midst, and moved flowing over the great gray causeway with its serpent balustrades, on to the portico, over the second and longer causeway, to pause finally on a broad platform under the very shadow of the temple itself. There mats were spread on the old gray stones and the torch-bearers ranged themselves in a circle about them. Musicians with strange instruments were squatting at one side.

We took our places, the musicians moved to their instruments, and, oh, unescapable horror of nationality, struck up in our honor "Marching Through Georgia"! The careful French do not organize temple dances, but how that

tune got into the Siamese jungle or what the ghosts in the temple thought of it I cannot say. As soon, however, as the unfortunate prelude was over we were back again in the realm of romance. Indra appeared and the Demon

King, in the very costumes and with the same peculiar motions represented in the sculptures; and it suddenly came over me that this dance and the old Brahman traditions had survived the centuries of Buddhist domination and the encroachments of the forest. It was late when the dance was ended. The procession formed again with the torches fluttering out; we were led across the first great causeway, where, turning to look back on the massive shadowy temple, we saw burning far up in the central tower a light before the golden Buddha that is now enthroned there. When we passed over the second causeway, the torches shone dim on the moat with its sleeping nenuphars, and at the door of the hotel the silent procession was merged again into the darkness from which it had come.

For our last afternoon in Angkor we decided to separate, each going as he would, to study or to dream; but towards sunset all of us, except Madame, who had found solace and companionship elsewhere, were lured up to the topmost tower, with its view over the

A PANORAMIC VIEW OF THE TEMPLES, TAKEN FROM THE WEST

temple inclosure, the causeway, and the moat to the forest which stretched away on every side to the horizon. When the clouds took on their first flush of color and the base of the great pile lay in shadow, the crescent moon came out above us; the shadow slowly crept upward, up from the base to where the golden Buddha sat with fire-perpetual burning before him, and as it passed, suddenly there was music. One of our party, who had a trained voice full of

feeling, had never sung so well before. Through the gray, twilight colonnades, around carved Apsaras and battle scenes of forgotten kingdoms, billowed the sound through perfect stillness—the strange exotic intervals of "Aida," the "Chanson Indoue" of Rimsky-Korsakov, the lament of Orpheus, and, finally, as the tropical twilight grew swiftly deeper and the great stars blazed out above the fading sunset, the voice of the invisible singer flowed out in the "Visi d'Arte."

Silently then each of us made his offering to the Buddha, remembering as well the older vanished gods for whom that gray mountain of stone had been erected; and when we had found our way down the incredibly steep flights of steps worn by the feet of forgotten centuries, turning, we saw once more, far above us, the eternal fire burning, like the jewel on Buddha's brow among the crowning towers that loomed dark and massive against the stars.

THE UNDERGRADUATE SURVEYS HIMSELF

LAST March The Outlook offered ten prizes for the best ten letters of about six hundred words from college undergraduates on intercollegiate athletics. With the offer we made the following comment:

There are a lot of questions which we think our readers would like to ask the undergraduate. Here are some of them:

What is the place of athletics in education? What constitutes the amateur spirit? Is it worth preserving? Is it endangered by proselyting? By athletic "scholarships"? By professionalism?

Is too much emphasis, or too little, placed upon sport? Upon victory? Upon championships?

Should the present system of intercollegiate athletics be modified? How? Should the undergraduate have more, or less, to say concerning coaching methods? Schedules? Eligibility rules?

What does the undergraduate think of the ethical standards and attitude of sport writers? What does he think of newspaper publicity? Huge expenditures for stadiums and trans-continental tours?

Those who try for our prizes should not try to answer all—they need not try to answer any—of these questions. They are merely offered as suggestions concerning the things in which the public is interested. We want our correspondents to present frankly and freely their views on what seems to them the most important athletic problem of the hour.

The response has surprised us. Undergraduates have sent us letters from one hundred and twenty-five colleges and universities in thirty-nine States of the Union. The task of the judges has been exceptionally difficult because of the uniform excellence of the contributions. In some of the other prize contests a half-dozen letters have stood out because of some individual quality in the writer or in his or her mode of expression. It probably is the fact that college athletics is not a subject that excites very deep or passionate feeling. Even when one has strong definite opinions about athletics one can express those feelings without heartrending emotion.

It is quite clear from these letters that, while the American undergraduate enjoys athletics and regards them as an important feature of his undergraduate

life, he does not feel that civilization is coming to an end or that his career is going to be wrecked by either reform or lack of reform of the athletic activities of his college. In other words, he looks at the problem—if it is a problem—as one to be dealt with in a common-sense fashion.

In reading these representative undergraduate letters three or four things have impressed us. First, if the letters

may be taken as representative of American college opinion, and we think they may, that opinion regards the athletic side of college life as subordinate to the intellectual side. Undergraduate opinion not only favors athletics as a source of recreation and pleasure, but, and beyond that, because athletics foster the college spirit, and loyalty to the college is as essential for the functioning of college life as loyalty to the country is essential to the functioning of citizenship. This view of college athletics is well brought out in the letter from a West Point cadet who wins a fourth prize.

There is apparently no sympathy for professionalism—that is to say, for the hiring of men to come to college in order that they may win games. There is apparently a good deal of feeling that there is a kind of professional attitude on the part of college authorities towards star athletes. Many of these undergraduate writers express the feeling that athletes, even when they are genuine undergraduates, are sometimes dealt with more leniently in matters of college discipline or college scholarship than they would be if they were not valuable to the institution as game winners.

Lastly, no one could read through this pile of contest letters without feeling that, on the whole, the American undergraduate is to-day being taught to use good, workmanlike English, to form independent opinions on current questions, and to express them forcibly and clearly.

It may be of some interest to add that The Outlook staff includes representatives of Harvard, Yale, Princeton, Chicago University, Amherst, Williams, New York University, Vassar, and Wells.

FIRST PRIZE A LAODICEAN SPOKESMAN

IN the perennial discussion about the relation of athletics to college life, two opinions are usually presented: First, there is the opinion of those who wish to keep athletics in the same status which it occupies to-day, with no more concessions to opponents of this system than absolutely necessary; second, the view of those who would like

to see athletics relegated to an obscure place in the collegiate scheme of things. There is in the colleges a third class who are so indifferent as to believe that the colleges are not being ruined by organized athletics. They also believe that the country and the colleges with it would suffer no irreparable injury if all the footballs in the world, and most of the football players with them, were consigned to a watery grave. This class I am proud to represent.

As the self-appointed representative of this great body of Laodiceans, I claim the honor of setting forth its platform.

The first plank is this: We want to be let alone. Almost every college that supports competitive athletics is supposed to owe its existence to some powerful force known as "college spirit." This particular brand of patriotism finds its expression almost entirely in going out for the team and rooting for the team. This kind of thing would be all right provided that it could be kept within reasonable bounds. It is an intolerable nuisance when it becomes such an obsession with the majority of undergraduates that they are expected to drop all other interests and pursuits and come out for the team if they can be at all serviceable. I have no plan to suggest which would bring about a change in this attitude toward athletics. I merely point out the fact that this overemphasis on the importance of sports is responsible for most of the evils which are laid at the door of organized sport.

In the second place, we want the newspapers muzzled as far as the publicity departments in the colleges can do it. It seems rather hard that after four years in a college, which one has learned to respect because of its traditions of scholarship and character and because of its student body, one should always go out into the world and find that its reputation rested on the records made by its teams. Most colleges seem desirous of getting a reputation of this sort, a fact which reacts on the undergraduate to make him feel that the alumni and trustees of his college are far more anxious to have him boost the stock of the college by a frequent appearance on the sporting pages of the newspapers than by scholastic accomplishment.

Finally, we are in favor of purely amateur athletics. If this means that the standing of every athlete should be investigated by a board appointed for that purpose, well and good. If it means that athletic scholarships and gifts by alumni to men who are star athletes must be abolished, let them be done away with. The whole matter should be left to a board appointed in every college to keep athletics clean. The members of this board should have two qualifications: they should know the difference between a professional and an amateur, and they should prefer the latter. We want this because it is not conducive to the self-respect of a member of a college to have his institution

represented by tramp athletes of a mental age averaging around thirteen.

The three points enumerated above are those which I consider most important in the regulation of college athletics. I have neither the space nor the knowledge of the subject to go into the various methods suggested for bringing to pass these desiderata. I have merely indicated what seem to me the main issues.

I am not in favor of abolishing athletics in the colleges. I like to go to a football game. I like to "take a pipe or a girl" to a baseball game when the weather is pleasant and the pop and ice-cream cones are circulating freely. What I do object to is having my interest in these sports taken as the most important factor in my psychology as an undergraduate, and used as a basis for building up great commercial organizations to boom the college.

JOHN W. SCOTT, JR.,

Princeton University, Class of 1923.

SECOND PRIZE

A LOPSIDED DEVELOPMENT OF INTERCOLLEGIATE ATHLETICS

Two years ago our football team made a transcontinental tour. Last year funds were raised for one of the largest stadiums in the Middle West. From where I am writing the sound of riveting hammers on the skeleton of that stadium is like the rapping of the first woodpecker. The Outlook asks what undergraduates think about it. Two pictures came to my mind as I read the announcement of the contest on intercollegiate athletics.

One day during the drive for stadium funds six students were at work in a laboratory. All but one, a girl in the freshman class, had been called upon by solicitors. The man assigned to get her subscription came to the laboratory. She told him frankly that she could not afford to give the amount set by the committee as the minimum which would be accepted from each student. He argued for half an hour, presenting the usual plea—that our present athletic field was too small; every one was doing his share; no one could show such a lack of school spirit; "years later you will come back and point with pride at this monument and say, 'I helped build that.'" The usual result followed; she signed on the dotted line. Turning to us and biting her lip to keep back the tears, she said, "I—I don't know where I can get the money."

Twenty thousand people are in the second picture, less than half of them students. Twenty-two men are spending every bit of strength and intelligence they possess for their colleges. The solid masses of humanity in the stands are yelling themselves hoarse and working themselves into a state of hysteria that any one would consider dangerous

to health and sanity if encountered anywhere but at a football game. Like a sore thumb on the body of intercollegiate athletics, football attracts attention out of proportion to its real importance.

The football fan can recite many reasons why his favorite sport deserves popular support: It maintains school spirit at fever heat; a winning football team influences young men of ability to enroll in the school; football receipts pay other athletic expenses; interest in the college among citizens of the town and State rises to high tide during the football season. These contentions may be true; but do they settle the question?

At this University school spirit measured by team support is the best in years. Lack of honor among the students caused the abandonment of an honor tradition and the establishment of a faculty committee on cheating in examinations. Wagers on the outcome of the games have been so common that the student who was not financially interested in the team's victories was popularly supposed to be missing a lot of the thrill in football. Our stadium will seat ten times the number of students in the University. Nine-tenths of the seats will be filled by people who see us when we are least sane. I wonder what impression they will receive of this University as an educational institution.

The expenditure for football is entirely out of proportion to the number of students who can be educated in habits of healthy recreation. Almost any other sport would serve better for that purpose. I believe our college athletics is suffering from a severe case of lopsided development simply because the public is willing to express its approval of one of our sports in dollars and cents. I wish we had the strength of character to do what is better for us, though not so popular.

"ECCENTRIC,"

Ohio State University, Class of 1922.

THIRD PRIZE

KEEPING ATHLETICS IN THEIR PROPER PLACE

MOST of the uproar over intercollegiate athletics sounds vain and needless to us up here in central New York. We have managed to do without scandals or violent disputes so long that we can hardly see the reasons for having them elsewhere. Not that our system of athletic control is perfect, or the relations of Faculty, coaches, and students entirely frictionless. But we have found that an able administration of sports, a faculty maintaining high scholastic standards, and a common sense of honor will keep college athletics in their proper place. Consequently we have indulged in very little altercation or anxiety regarding them.

Is not the whole matter being taken too seriously? Students perhaps tend to over-emphasize athletics, but their el-

ders tend as strongly to over-emphasize the evils of athletics. Both sides have simply lost their sense of proportion. Both are aided in losing it by the extravagant publicity that is constantly given to happenings in the collegiate world.

The desire for advertising stimulated by such publicity lies at the bottom of most excesses in intercollegiate athletics. Where they occur, investigation will show that the primary purpose of having teams and contests has shifted from the gaining of healthy recreation to the putting into public notice of one's Alma Mater. That is the objective which inspires the innumerable songs about "spreading her name and fame." A small institution which turns out a winning eleven finds, or fancies, its prestige to be greatly increased thereby. The temptation to build up more such teams by dishonorable methods is a natural consequence. After a few sea-

sons, behold a brazen college which makes no secret of its determination to win at any cost and by any means! Its slogan becomes, "Beat So and So," its ambition a place among the blackest headlines, its sole criterion victory. Betting and muckerism among spectators appear as pernicious by-products. But the greatest harm the school suffers lies in the change it makes from character building to team perfecting as the chief end and aim of its existence. The college becomes a gladiatorial training school.

Then the overdone journalism which created the evil begins to expose the results of its work in equally exaggerated tones. It "plays up" every disagreement over athletic policies, every squabble between rivals, every scandal among teams. The public, unaware how much these are magnified by the sporting writers, believes all it reads and concludes that intercollegiate athletics are

hopelessly corrupt. Presidents and professors shake their heads over the problem. Editorials are written and speeches made. The assumption is that because a few colleges have gone to extremes of sport mania all are possessed by it.

But meanwhile, in most places, the undergraduate plays his games with a glad heart and a clear conscience. He cheers for his team on Saturday afternoon, rejoices in victory or sorrows in defeat, but returns to work on Monday morning quite undemoralized. So it is with us at Cornell; so it must be at many another university which has not been poisoned with overdoses of printer's ink. If the newspapers will only forbear their sensational accounts, first, of our sports, and then of the abuses which they themselves have created in these sports, we shall contrive somehow to regulate the one and eliminate the other.

JOHN J. ELSON,

Cornell University, Class of 1922.

WILD LIFE ON A WILD ISLAND¹

BY ARCHIBALD RUTLEDGE

DURING the entire afternoon, though the northeast wind over the salt marshes had been keen and cold, I had kept to the deck of the little steamer; for the region through which we were passing is one of the most picturesque and romantic in America. Our route lay between those famous barrier islands of the Carolina seaboard and the vast sea-marshes which extend between the islands and the mainland shore. Through tortuous creeks we steamed slowly, breasting a strong head tide. On my right was the long, low wooded reach known as Long Island, the northern extension of Sullivan's Island, the scene of Poe's "The Gold Bug." This chain of islands extends for more than a hundred miles up and down the coast. They are separated by tidal inlets; sometimes narrow, extending themselves into the marshes as creeks, sometimes widening into bays and sounds. Always between the islands these inlets are deep and treacherous; and on them all kinds of craft must be handled with wary skill. Storms change the contour of many of these islands, but it has been observed that an island of this type, however small, seldom washes away. Compensation appears always to be taking place. For example, the north end of Bull's Island has washed away to such a degree that the old lighthouse, which once stood on the edge of the woods, far above the breaker line, now has apparently walked weirdly into the raging surf. At least there it curiously stands. But the south end of the island is being built up rather rapidly. Bull's Island is the last of this immediate chain; it

Photo by George Shiras 3rd

is more than thirty miles northeast from Charleston. Beyond it extends, vast and restless, the famous Bull's Bay, celebrated for its storms, its dangerous waters, and its delicious oysters.

It was to Bull's Island that I was bound, to observe the wild life there. I think perhaps there is no more favorable place in this country for the preservation of game birds and animals than this very island. Many years ago it was purchased by two gentlemen from the North, who have carefully protected it ever since. The results of their wise and humane experiment I shall try to set forth clearly.

The island itself is full nine miles long, and its width varies from a few hundred yards to nearly three miles. It

has a wide tidal creek winding up through a long and lonely region of it; and this creek is bordered by great stretches of salt marsh. Its entire eastern front is beaten upon by the Atlantic. Its entire western shore-line is lipped by a warm creek, languid and wan compared with the hale and epic tumult of the front beach with the ever-raging surf. Its northern limit is Bull's Inlet; its southern, Capers's Inlet. The mainland is far across the salt creeks and marshes, full four miles; but the going is so difficult that the effect of the distance is heightened. It takes a boatman six or seven hours to row from the island to the mainland; and it is a fact that, while deer often pass from other islands closer to the mainland to the mainland itself, seldom or never does a Bull's Island deer leave its home, unless it is to cross the inlet to the southward.

Ere on our journey we had reached this southern tip of the island I had gone below to try to get warm. In the cramped hold was a little cracked woodstove, the red flames glaring and licking through every ancient crevice. On one side of it was a huge drum of gasoline; on the other there was a ten-gallon can of kerosene. These, as you can imagine, I eyed appraisingly. Their proximity to the fire was, to say the least, interesting. On the floor about the stove were conveniently littered many splinters of resinous pine, which were even now oozing their sap because of the heat of the fire. I thought I had never seen a better arrangement for an explosion; and I made mental reservations that if ever I wanted to blow up a ship so that no one would ever be able to discover of her not even a spot of oil on the water, I should imitate the layout that I here

¹The studies of deer which decorate this article are from the camera of George Shiras 3d, a pioneer in the art of animal photography.

observed. Yet how quickly we become used to things! Grateful was the warmth; I ceased to be concerned, and after a while I forgot all about the fact that I was sitting on the lip of a volcano.

My reveries on many things were interrupted by a violent reversing of the engine; the engineer's bell sounded several times importunately; I heard our little craft bump lustily against some heavy object. Either we were in a collision or else we had arrived.

The hatchway was jerked back, a black head was thrust in.

"Cap'n," a respectful voice said, "we is to de island."

SWINGING myself up the ladder, I once more stood on deck. Never can I forget the impression poignantly borne in upon me. We seemed ringed by stars, tremulous and large and blazing; we were caressed by sea winds, warm and delicate and spicy here in the lee of the island; the distant surge and thunder of the surf came to me; far off I heard the plaintive fluting of yellowleg plover; mysterious voices of loneliness and of the night thronged to me from the whispering marshes and the brimming tide. It seemed to me that the world was one of sea winds and sea stars, of sea music and of sea silences. It was as if the mystery of life and of love had suddenly in beauty been revealed to me. I thought of Milton's—

A thousand fantasies
Begin to throng into my memory
Of calling shapes and beckoning shadows dire;
Of airy tongues that syllable men's names
On sands and shores and desert wildernesses.

A few minutes after we had landed, accompanied by my host, the manager of the estate, I walked up through the starlit woods of the island to the bungalow, which is strategically placed near the center of the island. The site is well sheltered from storms. Anciently, from Revolutionary times and even before them, the owners of the island had lived at this place. But the present house is modern. The manager told me that lately he had picked up in the sandy yard a penny of George II. I suggested Kidd and treasure; but he was inclined to believe that the island had been used many times by the British as a landing-place. It was so used in the Civil War, and at the north end of the island there are the remains of a fort of considerable size. The walls of this fort, now standing from a foot to two feet above the ground, were built of that singularly weather-resisting material, a mixture of lime, broken oyster-shells, and cement. It appears to me to be superior to a good deal of the modern concrete work.

As we walked up the dark road, a-glimmer here and there because of the white sand of its track, I was aware of a whispering from the thickety borders of our pathway. This rustling I soon found to be the sere talk of the dead

Photo by George Shiras 3rd

fronds of palmettos. I suppose there is nothing which is more grievously responsive to a movement of air than these same withered broad fronds, with all their frayed brown edges sighing, tapping one another, and "uttering unutterable things." Four times, however, on our half-mile walk up to the bungalow we started deer in the eerie darkness, and they fled airily, delicately, vanishingly at our approach. I knew of course that the creatures we started were deer because of the dainty, concise thudding of their hoofs and because of the tall flag-tail, ghostly in the night. I may say that there are not only a very great many deer on the island, but that until lately there was a small herd of pure albinos. There now remains one, possibly two. A pair were taken for museum purposes several years ago, and these interesting specimens may now be seen in the American Museum of Natural History.

REACHING the bungalow, we were greeted by an open fire of dry pine. Unlike many an island, this one furnishes the greatest abundance of firewood; so much, in fact, that driftwood need never be used. Pine is plentiful, and live-oak; and there are long stretches of red cedar, myrtle, water-oak, and palmetto. This last is one of the most singular of woods, being little more than a stalwart column of fibers and sinews, woven together with a marvelous compactness and strength. Until late at night the manager and I talked. He told me of the wild turkey experiment on the island. Some eight years ago, from a woodsman on the mainland, some wild turkey eggs were bought. These were hatched, and the young thrived. Indeed, I have never seen a more ideal place for the propagation of wild turkeys. Here on Bull's Island they have original growth woodlands through which they may roam; they have plenty of fresh water in the many ponds on the estate; the fox, their ancient arch-enemy, is not found; they have dense jungles of palmetto, cassine, and myrtle, where they may nest; they can live weeks and months utterly un-

molested; they have sunny washing places in the warm sand; and at all seasons they have abundant food. One thing proves the truth of these many claims: the island is full of turkeys. The proper establishment of them and wise protection have brought back to this lonely sanctuary, in numbers as abundant as in colonial days, this most magnificent of all game birds. How abundant they were, say, in 1768 may be judged from Bartram's "Travels." He declares that in the pine forests near Savannah the wild turkeys every morning broke his rest "with their incessant clamor, gobbling for hundreds of miles around." And even as late as 1800 a wild gobbler out of the Virginia wilds could be bought on the streets of Washington for a quarter. One sale of five cents is authentically recorded! Nowadays a wild gobbler (if it could be sold) would readily bring as much as a quart of old rye (if it could be sold).

When I retired that night, it was to the sound of sea winds through myrtles and palmettos, to the far human whistling of the yellowleg plover, and to the soft thunder of the distant surf. It was also to the thought that we were to be up long before daybreak, so that we might have breakfast and be down at the ponds before the morning flight of wild fowl would begin.

CERTAIN pearly streaks amid the eastern clouds were all the signs we had of coming day as we trudged down the grassy road toward the duck ponds. Over us hung great live-oaks, oppressive in their majesty. On one hand there was the densest of cane-brakes, in which I twice heard deer move. One doe walked timidly, mincingly across the misty road before us. On the other hand there was an open stretch of country which the manager told me, with some misgiving in his voice, was his farm. "Experiment station would be a better description," he said; "for by the time the deer and the wild hogs and the wild cattle get through with my crops there's hardly anything left but the signs of an experiment. Yes; it is very difficult to raise anything when the main object of a property is to raise wild life."

About a mile from the bungalow we swung off to the left, following an old trail through the myrtle jungle. Then the jungle broke away and we came to a long, wide arena starred here and there by placid dim ponds and ringed about by the moss-draped, dewy, listening woods. Between the ponds and the woods were small meandering streams that wound through grassy meadows, and both streams and ponds were bordered by marshes and reeds and rank grasses. On this particular morning, though there was no frost, the grasses were stiffened with a delicate rime. My companion left me in a blind at one of the ponds and he went forward to another, half a mile distant. While I was there chiefly to observe, we were to shoot a few choice ducks for dinner.

I sat down in the blind, which was

nothing but a natural growth of cedar and scrub live-oak jutting out toward the pond. Grayly, then rosily, the day came. It was a silent morning, and only fitful sea airs stirred the dark tresses of the pines and the pale pendulous mosses. As the light became stronger, the forest edges surrounding me, which at first had merely glimmered vaguely in the distance, began to take distinct yet soft outlines. It was the most beautiful of all forests—that of a semi-tropical island. Lacking the grandeur of primeval timber growths on the mainland, it had nevertheless a romance, a haunting charm, a poignant beauty that I know not how well to describe. These forest brinks seemed to me marginal to all the wonder in the world; and their appeal had about it something sad, something heartbreaking, like the glamour of eternal beauty. Whatever storms come, whatever winters befall, this mystic sanctuary, walled about by the deepest and densest island woods, remains constant in its peace, its solitude, its loveliness. It seemed a country for fairies and for fays. However, I was soon to be reminded that it was a country for wild fowl.

OVER the tops of the tall pines, in the clear morning heavens, coming apparently from nowhere, but following, as I knew, a regular line of flight, a flock of green-winged teal came hurrying. If there is a swifter duck than the teal, I have never seen it. And the teal not only hurries but does so intently. Usually this intentness appears to be the result of some call to a far-distant place; but these particular visitors were intent upon alighting in the pond immediately before me. After one has long been familiar with ducks that fly high, craning their necks to discern hidden gunners, and that circle a half-dozen times and then do not alight, it was a pleasure to have these beautiful little confiding ducks come "straight at me," as it were, and settle, after a maneuver as swift as light, with an elfin grace upon the dark waters of the lonely pond. These were soon followed by a pair of mallards, looking larger than normal in the misty light. Instead of taking the water, they alighted in the rimy grass, and then sedately, with heads raised high, they waddled heavily toward their favorite element. When these were afloat on the water, I had a wild-life picture before me worth coming far to see. Though not usually acknowledged as such, the mallard drake is one of the most gorgeous of all water-fowl, especially when he is relaxed so that his plumage shows to advantage. Indeed, in this respect all wild creatures are like all other living things—they cannot show their beauty unless they are at peace. They may show their speed or their alertness, their fear or their wariness, but not their beauty. A great wild gobbler strutting and gobbling in his native glades when the ardor of spring love is upon him is an entirely different bird from the tall, crafty, elusive, fear-

Photo by George Shiras 3rd

shrunk skulker of the hunting season. A decided difference in character as well as in appearance is always discernible between the flirtatious and the fugitive.

My wild fowl gathering was suddenly augmented by an inrush of eight huge black ducks which had approached behind me and had drawn beautifully to the water almost before I had seen them. Upon alighting they did not drift in stately beauty, like the mallards, but at once began foraging in the most material fashion. Paddling about in the warm water, they soon came to a muddy black spit, over which they crowded greedily, running their bills along the soil in true vacuum-cleaner fashion. They were very garrulous.

AND now across the glade, mistily roseate with the coming of the sunrise, I saw two shapes on the glimmering borders of the woods. They were deer—two bucks; for at this season of the year, the mating period having passed, the bucks and does do not readily consort. The does usually go alone or in small groups of two or three; the bucks are nearly always paired from the close of the mating season, which in this latitude may be said to end at some time in December, to the time of the dropping of their antlers, which is usually in February. While bucks are often solitary throughout the entire year except in the breeding season, I have often observed paired bucks in the summer. A friend of mine once started from a thicketed pond five velveted bucks, and in time of a flood another friend of mine counted a herd of ten bucks.

These bucks that I now saw illustrated perfectly certain characteristics of deer nature. They were the most shadowy, evanishing, elusive creatures imaginable. I can easily conceive that when the ancients peopled the forests and the fields with nymphs and dryads, fawns and satyrs, they perhaps had had just cause for their beliefs in such creatures, for had they not seen at twi-

light and by moonlight eerie forms which appeared to belong to the supernatural world? These deer that I saw looked like spirits; and even though they had not, as I knew, been molested for years by hunters, they appeared to have lost none of their dainty wariness, their delicate craft. Soon and silently the gray-green forest hid them. They melted into it.

Now to the pond, through the heavens crimson with sunrise, came a long line of yellowlegs, fluting melodiously. They alighted on a mud-bar amid the foraging black ducks. Hooded mergansers appeared over the pines and down into my pond. And now the whole air was suddenly thronged with ducks of many kinds: mallards, widgeons, spriggs, teal, wood-ducks, and black English. It was a pure delight to watch these beautiful wild things come trustingly to this solitary place. Erelong there were more than a hundred ducks of various kinds on the water before me. Long shafts of sunlight, striking across the foaming breakers and through the dim forest aisles, tinged and tinted the scene. Softly but brightly the dew-jeweled woodland gleamed. The rimed grasses steamed airily. It was an idyllic scene. But the children of nature are seldom long at their ease.

IN less time than I can tell it my pond was empty. The dark, dancing waters were all that remained, while in almost every direction fled frantically the wild fowl. An ancient enemy had appeared. He came sailing in scornful splendor toward me. It was a male bald eagle, one of a pair which had since my boyhood nested on this island. The bird was probably older than I. He was indolently lordly. He disdained to pursue. The power and majesty of his flight were very impressive; in the pure sky he looked like the black symbol of wild nature's eternal menace.

After the dispersal of the very pleasant company that had been mine I knew that the morning flight of wild fowl was practically over. I therefore rejoined my companion, and together we repaired to the bungalow, sunning itself amid its live-oaks, drowsy giants that placidly watched our approach. An hour thereafter I sallied forth alone to spend the remainder of the day studying the deer and the other forms of wild life on the island.

Lest my account become too minute, I shall give the observations I was able to make, and not be too specific as to the exact circumstances attending each observation. My course took me across waste lands of reeds and marsh, retiring warmly into the ancient forest; down roads of unimaginable beauty and peace, mile after mile winding through primeval woodlands; out on the lonely beach. Everywhere was evidence of abundant wild life. I flushed three flocks of wild turkeys, and wherever in the road there was a litter of pine straw and leaves this would be seen to be torn up by the busy scratching of the big birds. In the

marshlands there were endless paths, winding interminably. These were used by the deer, the wild hogs, and the wild cattle. During a part of one day I counted upward of forty deer, and on the island there can hardly be fewer than four hundred. Probably two years ago there were many more; but a visitation of the deer's only plague—anthrax—sadly diminished the number. The coming of this disease was followed by a dreadful outbreak of cholera among the hogs, so that everywhere, the manager of the estate told me, were dead deer and dead swine. I think it interesting to use this matter as a probable proof that the germs of these and of similar diseases are carried by vultures. At the time mentioned there was cholera on the mainland, and there was some black-tongue also. Since both the black vulture and the turkey buzzard pass frequently from the mainland to the island, and since no other creatures do, the proof appears clear that these scavengers are the carriers of disease. Our Department of Agriculture now admits, I believe, the probable truth of this important theory.

THE deer of the island have very interesting habits. Throughout the greater part of the day they retire to the deep woods, where they do less sleeping, I believe, than ruminating. The possession of several stomachs is a matter to which these and similar creatures give due consideration. They bed down in warm grass, in bunchy bushes, under palmettos, in cane-brakes. A deer loves a place that is warm, sheltered, and that offers a few rays of grateful sunshine stealing in upon him. Thus are the daylight hours drowsed away. When the sun is low and the long shadows begin to darken the marshes, the deer troop forth, either on the front beach, where they love to walk among the rolling dunes, or to the marshes, on whose edges they find their best feeding ground. While I started many deer in the forest, my best view of deer was late in the afternoon, when they came forth from their deep haunts to roam the wild waste country between the woods and the surf, or between lonely reaches of forest. While walking quietly along the edge of a marsh I became thrillingly aware that a deer was looking at me from the border of the woods. It was a buck, and full-antlered. He held his head strangely high. There in the dusk he stood, not twenty yards off, haughtily, impatiently alert. I saw him toss his head petulantly. He saw me, but did not recognize me. In a moment more, however, he was gone into the thicket. Over the marsh I saw shadows trooping. I counted at one time fourteen of these deer. But then the night closed in. It was time for me to stop observing. Besides, I happened to be five miles from the lodge.

But during this day and the days that followed I saw more wild life than deer and wild fowl and turkeys. The island is infested by wild hogs, which appear

to thrive splendidly. They are a good deal of a nuisance, for they break through all fences and root up all crops. They are, however, valuable as a check to the cottonmouth moccasin, the only venomous snake on the barrier islands. The rattlesnake has never been seen here. The hogs have heavy toll taken from their ranks by a few alligators, which live in deep holes in the freshwater ponds. It has but lately been discovered that these huge saurians are at home in salt water as well as in fresh, and they are not infrequently seen in the salt creeks, and even in the surf. A big bull alligator grimly riding the breakers is truly an impressive sight. There are many wild and half-wild cattle on the island. Many of these I encountered. They eyed me with sullen truculence, and their wariness, though of a clumsy sort, was almost equal to that of the deer. Once, after a long crawl through a fetid jungle darkened by myrtles and palmettos, I gratefully rose in a little green savannah, glad to be able to stand upright once more. But my relief was momentary; for thirty yards off, standing with a certain air of outraged majesty, was a magnificent bull of massive proportions and of a symmetry known only to wild things. Grouped behind him were a dozen other cattle. All of them faced me at exactly the same angle; they appeared statues of angry surprise. But all these creatures behave in the same way: what the leader does all of them do. If he advances, they come forward with him; if he turns, they wheel as if performing maneuvers. I have never had any sort of an opinion of my eyes as hypnotizers; but since that wild bull turned from me and he and all his followers fled crashingly through the jungle I have had a hope of occult power. It is a harmless and pleasing thought.

OF smaller wild animals on the island, the raccoon is the most numerous; the mink is present, but is most difficult to come upon, and, as it spends much of its time traveling about the salt marshes

to westward of the island, it is hardly a true resident. Here the otter has been seen; but, as this splendid fur-bearer is essentially a wanderer, it is doubtful if he remains on this limited range. But the raccoons are absurdly abundant. In broad daylight they can be seen snoozing philosophically in the comfortable low crotches of trees, and sometimes ambling thoughtfully down the bypaths of woodland and of marsh. This wise, friendly, interesting little creature finds on this wild island a most congenial home. A range like Bull's Island can easily support a colony of more than a thousand raccoons. Always with wild life—and perhaps with all life—the primary problem is the question of food. Here the sea feeds the children of the land, for as long as a raccoon can get an oyster he is happy.

In contrast to the number of raccoons is the comparative scarcity of common birds. Wild fowl are abundant, and in the migrating seasons the shore birds come in myriads. In the summer vast colonies of herons breed in the myrtle jungles. But there are few common birds. I saw some blue jays, two mocking-birds, and a half-dozen sparrows. Yet at this time of the year on the mainland, a few miles off, the thickets are noisy with the singing and the busy scratching of thousands of brown thrashers, cardinals, juncos, whitethroats, and towhees. The wide and lonely salt marsh isolates the island; only the hawks, the eagles, the vultures, and the strong-pinioned game birds come here, and a few wanderers of the smaller species. I was pleased to flush several woodcock, which were singularly tame. So attracted are they by the peace and security of these island woods that they sometimes remain in this situation to breed.

Such, then, are some of the aspects of the wild life upon this "beauteous lonely isle." It is a place forever echoing with the "rolling anthem of the beach," forever isolated, forever charged with a certain mystery and solitary danger; the haunt of creatures essentially wild, yet living as though life held no real dangers. In observing these birds and animals I felt as Alexander Selkirk felt: "Their tameness was shocking to me."

AND now that I am far from the island, it is like a dim lost glamour-land; yet its varied scenes recur vividly. I see once more the shadowy gray dunes over which pace lordly bucks and mincing does; I see long stretches of mysterious marshland, over which a great eagle beats in solitary power; I see the deep-hearted peace of sunlit virgin woods; I see long ranks of red cedars, rimming the beach but apparently blasted away from it by the storming of many sea winds; and high over all the island I view certain thoughtful black pines, looming and listening—ominous strong warders keeping watch through the long years over all this beauty and all its loneliness.

THE BOOK TABLE

THE ROOTS OF PROGRESS

BY LYMAN ABBOTT

MR. JAMES HARVEY ROBINSON represents a school of thought which is more attractive to the curious than convincing to the thoughtful. Its essential principle as interpreted by Mr. Robinson may be thus stated.

Human progress dates from the days of Francis Bacon. All conclusions reached prior to his time may safely be disregarded. That a conviction is ancient and has apparently stood the test of time raises a presumption against it. The reason has been used mainly to defend ancient beliefs against innovators, to satisfy existing ignorance, and to discourage creative thought. There has been some progress in scientific thought, some gain in our knowledge and use of material forces. But there has been no progress in moral and social life, no truths that can be accepted as established by reason or approved by experience. Everything is open for reconsideration. "We should proceed to the thorough reconstruction of our mind, with a view to understanding actual human conduct and organization." In such reconstruction no help is to be expected from either the churches or the schools and universities, and vigorous opposition will come from the lawyers and the business interests. With this brief summary of Mr. Robinson's fundamental contention, we may leave this brilliant but not always historically accurate or self-consistent book¹ while we turn to consider the philosophy which it advocates.

Everything is not open to reconsideration. Some things are *known* and we are quite right in refusing to reconsider them, though there is no reason why we should refuse liberty to those who wish to give time to such reconsideration.

There are certain instincts which are essential to human nature; for example, *thirst*. Science examines the river, and assures us that after we have poured into it our sewage the water is not fit to drink. Thanks. It examines alcohol and the human body, and the majority of scientific students, at least in this country, and an increasing number in Europe, advise us that alcohol is a poison, sometimes useful as a medicine, not beneficial as a beverage. Again thanks. Conceivably the scientists might advise us that tea and coffee are injurious as beverages, and we certainly should consider and might accept their decision. But if a health reformer should assure us that man is not a thirsting animal and that he should not drink any fluid, we could safely disregard him and undoubtedly should do so. We may reconsider *how* we can best satisfy our thirst, but we shall never re-

consider the question *whether* we will satisfy it or not.

The desire for property is as much a human instinct as the desire for water. The social reformer may diagnose "the sickness of acquisitive society," and we will listen to him. He may point out the evils of a society which gives itself over to acquisition and suggest remedies for these evils, and we will thankfully consider his recommendations. He may ask us to reconsider what are the rights of property, what is the basis of the right, what are proper objects of personal property, what limits to acquisition a man should put upon himself, what limits society may put upon its members, how far it is expedient to adopt some form of collective ownership, and we will consider what he has to say. But if he proposes to abolish all property rights and frame the laws of society as though man were not essentially an acquisitive being, he need expect no hearing. Even the dog recognizes a right of property and if another dog attempts to take his bone away from him will fight to retain it.

Reverence is not less a human instinct than acquisitiveness and thirst. Man's physical nature impels him to drink; his social nature impels him to acquire property; no less does his spiritual nature impel him to look up as well as off. Heroes and hero worship are as universal as the race and as old as history. If the philosopher succeeds in convincing a few individuals that they should not reverence God, they proceed to reverence "our Father Man." Even Mr. Robinson apparently recognizes this as a fact in human history, for he says, "One of the finest examples of early Greek skepticism was the discovery of Xenophanes that man created the gods in his own image."

Not only are there certain elemental instincts of man which intelligence can serve and to some extent control but cannot abolish, there are also certain truths of the moral order which have been so firmly established by experience that most of us refuse to give them reconsideration. Mr. Robinson's apparent contention that no progress has been made in the moral and social condition of humanity on which we can safely build and which we can carry forward to their predetermined goal is not sustained by history.

America is in size of territory and in its conglomerate population somewhat analogous to ancient Rome. But the moral contrast between the two is very striking. Then autocracy, now self-government; then slave labor, now free labor; then drunkenness universal, now a Republic that has taken a National pledge of total abstinence; then no provision for the education of the common

people, now a public school in every State and Territory under United States control; then marriage a contract which either husband or wife could cancel at pleasure, now marriage a bond which can be canceled only by court decree.

The American people are perfectly willing to consider how they can purify their government, perfect the emancipation of labor, abolish the lawlessness of the forbidden liquor traffic, extend their public school system, and improve their marriage and divorce laws. But any reformer who proposes any plan which threatens to hinder their progress to their selected goal of self-government, to reimpose under any disguise chains upon labor, to re-enthroned the discredited liquor traffic, to dispense with public education and confine education to a class, or to abolish the family and go back to the paganism of ancient Rome, has no reason to complain that the American public refuses to give consideration to his proposals. They do not refuse him the chance to make those proposals to any who wish to listen; but it does not violate liberty of speech for the State to refuse to pay salaries to such reformers in the public schools, or for endowed colleges and universities to refuse to such teachers salaried positions as professors or instructors.

The radicalism which repudiates all the lessons of the past is a natural reaction against the torism which forbids all experiments in the future. The affirmation that the Nicene Creed is the last word in religious thinking and nothing must be added to or taken from it forbids religious thinking; but to affirm that all religious thought to date has been in vain and that the results should be thrown into the rubbish-pile is not encouraging to thinking in the future. We shall not reform the drama by going back to Shakespeare's time and endeavoring to re-establish an Elizabethan theater with an Elizabethan stage; but neither shall we reform it by contemptuously discarding Shakespeare's plays. We cannot accept Plato's "Republic" or Augustine's "City of God" as the final model for a perfect society; but neither shall we be likely to frame a true brotherhood for the future by ignoring all attempts which poets and prophets have made in the past to make an architectural blue-print of brotherhood.

We quite agree with Mr. Robinson that education is needed "with a view to understanding actual human conduct and organization." But this should begin with the prophet who demands it. He constantly impresses us as misunderstanding or ignoring what is going on in the world about him. For example, Mr. Robinson says: "No publisher would accept a historical text-book based on an explicit statement of the knowledge we now have of man's animal ancestry." The obvious implication of this—that a dominant prejudice forbids the public discussion or study of man's ori-

¹The Mind in the Making: The Relation of Intelligence to Social Reform. By James Harvey Robinson. Harper & Brothers, New York. \$2.50.

gin—is sufficiently refuted by the popularity of books by Osborn, Breasted, and Van Loon. Mr. Robinson says: "The student of humanity . . . can look for little help from the universities as now constituted." Some of our universities are sharing the work of education with the factory and sending their students to study in companionship with factory workers; others require as a condition of sociological study in the university that the student shall make a personal investigation of the labor situation in some factory; and one of the most illuminating books we have had in the past two or three years is the report Wisconsin University has made of a systematic examination of eighteen successful corporations endeavoring to introduce the spirit of human brotherhood into their works. Mr. Robinson sees all potent business interests backed by the politicians and in general supported by the ecclesiastical, legal, and educational classes

"opposed to social improvement or even social experiment." This is only a half-truth. It is also true that the actual transformation of the Philadelphia Rapid Transit from an aristocratic into a democratic organization, reported by Mr. Sherman Rogers in *The Outlook* for April 12, has thrown more light on our industrial problem than any reconstruction of the mind in the class-room, and it is only a notable illustration of what, according to Professor John R. Commons's report, from ten to twenty-five per cent of our industrial organizations are trying more or less successfully to accomplish. The reconstruction of our industries is being seriously attempted, and with a considerable measure of success, by men who do not throw all past thinking and all past experiment into the discard, but learn from the past how they may the better build in the present for the future. This is the true recipe for progress.

THE NEW BOOKS

FICTION

CHILDREN OF THE MARKET PLACE. By Edgar Lee Masters. The Macmillan Company, New York. \$2.

Mr. Masters takes as the central figure of his semi-historical novel the "Little Giant" who met defeat as a debater and political leader of opinion at the hands of Abraham Lincoln. The study of Stephen Douglas as a person as well as a politician is extremely well done. The book gives also a minutely drawn picture of life in Illinois, and indirectly in other parts of the country, during the tremendously important period of American history between 1835 and 1860. The author makes the reader feel that he is present and sees the development of the country, the agitation as to slavery, the growth of intercourse between different parts of the country, the advance from the primitive canal-boats and stage-coach to the newly built and rapidly extending railways. There is a strong dramatic situation also in the personal problem of the young narrator. He goes to Illinois from England to settle his dead father's estate, and finds that he is half-brother to an octoroon girl of estimable character and charming personality, whose quadroon mother his father married under singular circumstances. This situation ends with the murder of the girl, and that leaves the latter part of the book without any very strong dramatic or personal story-interest. The book is remarkable as a study of American life and of the conflict of race and political passions in the period treated.

LEGEND OF ULENSPIEGEL AND LAMME GOEDZAK. By Charles De Coster. Translated by F. M. Atkinson. 2 vols. Doubleday Page & Co., Garden City. \$5.

The impish Ulenspiegel is familiar to readers of German legends and folklore and figures also, we remember, in one of Sir Walter Scott's less read dramatic poems. He and the less well known Lamme Goedzak are the principal actors in these two volumes, which, though

they are formidable to look upon, are anything but difficult to read. Mr. De Coster has adapted these legendary personalities to Belgian history and literature. The translation preserves the dramatic and humorous effect of the original and the adventures are truly as described in the title, "heroical, joyous, and glorious."

TRAVEL AND DESCRIPTION

DINGBAT OF ARCADY (THE). By Marguerite Wilkinson. The Macmillan Company, New York. \$1.75.

A charming account of an adventurous trip taken by the author and her husband in a boat of their own manufacture. With this book in hand one can take the joys of adventure with the comforts of staying at home, and it is probable that the wife's graphic pen will make this pleasure possible to a great many readers who would never think of taking such an "inland voyage" in any other way.

RIVERS AND THEIR MYSTERIES. By A. Hyatt Verrill. Illustrated. Duffield & Co., New York. \$1.50.

An encyclopædic collection of facts about rivers, co-ordinated into chapters that have a real story-interest. The formation of rivers, their effect in changing the landscape, their commercial importance, the forms of river life, underground rivers, tropical rivers, ice rivers—all are described in an appropriately flowing style that holds the interest unflaggingly.

RELIGION AND PHILOSOPHY

STUDENTS' HISTORY OF THE HEBREWS. By Laura A. Knott. With Maps and Illustrations. The Abingdon Press, New York.

This volume from the pen of the former Principal of Bradford Academy (Massachusetts) is a fruit of years of teaching the Bible to the older pupils supplemented by two years of special study. Prepared for students, it is specially adapted for use as a text-book in Bible classes, whether in Sunday schools or in day schools. The author accepts

the conclusions of modern scholars and wisely refuses to perplex the minds of the pupils with an account of the processes which have led to those conclusions. Thus she describes the Book of Daniel as written by some unknown author in the time of Antiochus for the purpose of encouraging the martyrs of that age; the Book of Jonah as a parable or apologue, a satire on the narrow-mindedness of the Jews, and not intended by the author to be regarded as historical; and recognizes the composite character of the authorship of the historical books of the Old Testament. The general editor of the "Religious Education Texts," to which series this volume belongs, draws in his Introduction the distinction between study of and study about. This book is chiefly a study of the Bible in the light of modern knowledge respecting it. The book is reverent in spirit, fearless but constructive in treatment, positive but not dogmatic in its conclusions, and lucid in style. It can be heartily commended to parents who wish a book to help them in studying with their children at home. It brings the history down to the destruction of Jerusalem, but does not include any account of the life of Christ.

ARE YOU SEEING AMERICA FIRST?

BY

MARGUERITE A. SALOMON

THIS is the time of year when the annual vacation pilgrimage is about to begin. It is therefore the purpose of this article to offer certain suggestions to the reader who is planning to "see America first."

Perhaps the average American has failed to realize the infinite variety of vacation spots which our own country affords.

Most of us seem to know more about Europe, Asia, or South America than we do about our own glorious land, and yet these United States offer a tourist the greatest variety of delightful experiences.

Presuming the potential vacationist is from the East and wishes to go only a short distance, he has a wealth of places from which to choose. Perhaps he is a lover of the woods—a fisherman or a huntsman; he may be a motorist craving good roads, wanting to spend an entire outing in his car; or, he may like the seashore best, with its bathing, boating, and other water sports. He may want to live in luxurious, comfortable hotels or he may greatly desire to "rough it" in a tent, far from the hustle and unrest of civilization.

NEW ENGLAND

The New England States are intensely "vacationland." Every imaginable type of resort, suiting every pocketbook and every taste, can be found from Maine to Connecticut. Space does not permit a complete description of the limitless opportunities for bathing, sailing, canoeing, driving, motoring, tramping, mountain climbing, golf, fishing, hunting, and camping to be found here. What is more delightful, however, than the Rangeley Lake or the Moosehead Lake region in the Maine woods, each of which is so very accessible? Names to conjure with for the lover of the seashore are Nahant, Swampscott, Marblehead, Beverly, Manchester-by-the-Sea, Magnolia, Gloucester, Rockport, Annisquam, and Salisbury in Massachusetts; Hampton, Rye, Little Boar's Head, New Castle, Portsmouth, and the Isle of Shoals in New Hampshire; Kittery, York Beach, Kennebunk, Wells Beach, Ogunquit, Old Orchard, Prouts Neck, Scarborough Beach, and Casco Bay with its hundreds of charming islands in Maine?

And the mountaineer and nature lover can revel for days in the exquisite beauty of the White and Green Mountains. The Presidential Range, with its Old Man of the Mountain, the Flume in Franconia Notch, and the Lost River region are the best known of nature's attractions in the White Mountains. Both the White and Green Mountains also are a motorist's paradise, for not only can he find negotiable and rather remarkable automobile roads, but the

greatest variety of fine hotels to meet his every desire and comfort.

Then there is the charming lake and inland section, including the beautiful highland lakes of New Hampshire—Winnepesaukee, Sunapee, and the others; and the pretty farming sections of the Merrimac and Connecticut Valleys and the restful Berkshire Hills. There is a definite charm in the quaint New England towns of Stockbridge, Great Barrington, Lenox, or Pittsfield in the Berkshires.

NEW YORK STATE

New York also offers a wide range of choice to the vacationist. In the Adirondacks the out-of-doors lover will find the many camps satisfying in the extreme. Every imaginable type of out-door sport can be found, and the more fastidious tourist who wishes for comfort rather than the rough backwoods camp will have in the Adirondacks everything his heart desires. Such charming spots as Saranac Lake and Lake Placid, Loon Lake and the Fulton Chain of Lakes, to say nothing of Schroon Lake, are a medley of ideal vacation spots, each with many fine hotels and camps.

Lake George and Lake Champlain—both exquisite as can be—abound in fine boarding-houses and hotels and are visited annually by thousands of vacationists from New York and other near-by cities.

At Buffalo one can take a comfortable steamer and spend one of the finest vacations in cruising through the Great Lakes. This "sea voyage" on these unique inland lakes—so huge as to be more like miniature oceans than lakes—provides a truly interesting experience.

THE NORTHERN WOODS AND LAKES COUNTRY

Then, going a bit farther westward, and only one night from Chicago, is the great lake-dotted North Woods district of Wisconsin and Michigan—a land of wild and witching beauty and infinite charm. It is truly the outer's paradise. This is a primitive playground in the midst of lake and pine. Geographically, this region is about seventy-five miles north of Green Bay and fifty miles south of Lake Superior—a comparatively short trip from any of the Middle West territory. Three Lakes, Eagle River, Tomahawk Lake, Mid-Lake, Bolton, all are the centers from which the vacationist can start for a summer of unalloyed joy.

There are two distinct kinds of resorts in the North Woods region. There is the one with board walks, electric lights, ballroom, and tennis courts, and with all the attractions of any fashionable resort with the added touch of the near-by wilderness. Then there is the other—the camp and log cottage of the more primitive type, with the fun of fishing, hunting, boating, berrying, and exploring for unmapped lakes keeping one busy from morning until night. This is the land of outing clothes and camp-fires at night, the land of true recreation—and recreation.

A little farther on to the west, in the

ARE YOU SEEING AMERICA FIRST?

(Continued)

State of Minnesota, an almost identical type of country is found and is quite as alluring as Wisconsin and Michigan. They speak euphoniously of the "ten thousand lakes of Minnesota," and it is indeed true that there are thousands of lakes—enough for everybody and no crowding. This "land of the sky-blue waters," the terminus of which is St. Paul and Minneapolis, presents fine motor highways and hikers' trails, free automobile camp sites and splendid hotels and inns, and every imaginable enjoyment for those who want a happy vacation.

OUR NATIONAL PARKS

Taking it all in all, there are no more delightful recreation spots in this country than our National Parks. These are rightly called "playgrounds for the people," and, each with its own individuality, its own charm, and its own unique features, offer the widest range of scenery to the tourist in this country.

Of course the ideal thing is to visit them all. If this cannot be done, then at least one or two of them should be included in every Western itinerary. Later on in this article I will outline a few suggested tours, including one or more of the Parks.

The eleven most important National Parks are Glacier, Mount Rainier, Crater Lake, Yosemite, Sequoia, and General Grant; Zion Canyon, Yellowstone, Rock Mountain, Mesa Verde, and the Grand Canyon of Arizona.

Glacier National Park, in Montana, is the "happy hunting-ground" of hiker and mountaineer. This is a rugged mountain region of unsurpassed alpine grandeur. Here are hundreds of glacier-fed lakes of romantic beauty, peaks of unusual shape, and precipices thousands of feet deep. A fine system of trails has opened up this hitherto wilderness and an equally fine and rather unusual system of hotels and chalets affords a vacation of comfort and ease and good times not to be duplicated anywhere else.

Mount Rainier National Park is remarkable for its exquisite scenery and its interesting glacier system. Forty-eight miles of glacier, the largest and most interesting being the famous Nisqually Glacier, will keep the mountaineer busy exploring for many a day. The remarkable sub-alpine wild-flower fields present a sight so lovely that one will feel like lingering for a long while merely to see them. A comfortable inn, situated almost at the summit of Mount Rainier, is an added attraction.

It is the unique formation and the wonderful color of Crater Lake which brings the curious to see this marvelous feat of nature at Crater Lake National Park. The lake is an extraordinary shade of blue—sapphire—so blue, in fact, that when artists paint it naturally they are accused of over-coloring. Crater Lake has no outlet or inlet, and its sides are 1,000 feet deep. It was formed in the crater of the extinct volcano

Mount Mazama. Fine trout fishing keeps the traveler at the tiny but rather inadequate lodge often beyond his scheduled time.

The Yosemite National Park, in middle-eastern California, is the "beauty" of them all. Here is found some of nature's grandest scenery. El Capitan, Sentinel Dome, Mirror Lake, the views from Glacier Point, Bridal Veil Falls, Vernal Falls—these are names to conjure with! Fine hotels and camps located at convenient intervals take care of the many tourists who visit Yosemite all the year round.

Sequoia and General Grant National Parks, which are really the "big tree" preserves, contain most of the wonderful giant sequoia or redwood trees which every traveler to California must surely see. They are one of the wonders of the world.

Zion Canyon National Park is one of the latest of our National Parks. It is located in southern Utah and contains some of the most wonderful scenery in this country. At present the only accommodations suitable for the traveler are found in a small camp; but for those who love exploring into the unknown and who wish to get away from the beaten track Zion Canyon will appeal immensely.

Yellowstone National Park, in north-western Wyoming, is the second oldest of our National Parks. Here, assembled in a small area, is the greatest collection of the grotesque and queer phenomena in nature. The many hot springs and pools, vari-colored waters edged with rainbow hues; a prismatic lake; wonderful geysers—more geysers than in the rest of the world together; bubbling mud geysers and hot "paint pots"—all these give the traveler the feeling that he is seeing the world in its making. And aside from the grotesque there is the Grand Canyon of the Yellowstone and Yellowstone Falls. The view of this gorgeous, pastel-shaded canyon from Inspiration Point is indescribably beautiful. Yellowstone National Park contains a fine chain of hotels and camps.

Rocky Mountain National Park, in north-middle Colorado, is essentially the place for an ideal summer's vacation in the out-of-doors. Here in the heart of the Rockies, surrounded by wonderful snow-capped peaks, many of them more than 10,000 feet in altitude, are found a number of charming lodges, affording the best of accommodations. Being so very accessible both by train and by automobile makes this particular Park one of the most popular of all the National Parks.

Mesa Verde National Park is particularly interesting because it contains the most notable and best-preserved prehistoric cliff dwellings in the world.

The Grand Canyon of Arizona—the Colossus of canyons—is the most sensational of all our scenic wonders. This remarkable work of nature, so beautiful and wonderful, so indescribable, this masterpiece of erosion, is really awesome in its grandeur. An excellent hotel is built on its rim, and the tourist

Capitol, Helena, Montana

Helena—the City of Romance

thrills with its memories of the stormy period of the Vigilantes. Its main street traces the Last Chance Gulch, which produced some 40 millions of dollars in gold! Today Helena is a modern and attractive residence city with excellent hotels and on the route of Park to Park travel (Yellowstone to Glacier). Visit Helena enroute.

Northern Pacific Ry.

"2000 Miles of Startling Beauty"

The Famous Cruisette

A Noteworthy Achievement In Economical Luxury

COMPARE the Cruisette with any other boat of anything like equal size on the market. You will admit it is the best built—best engined—and the cheapest boat you can buy.

A Standardized craft—33 feet long, 40 horsepower—with the essentials of seaworthiness, reliability, comfort and roominess that the purchaser has a right to expect.

Let us send you comments of satisfied owners. You will be interested to read of the efficiency and general adaptability of this wonderful little craft.

ELCO STANDARDIZED MODELS

33 ft. Cruisette, sleeps four	speed 12 miles, guaranteed
40 ft. Cruiser, private stateroom	speed 11½ miles, guaranteed
54 ft. Twin Screw Deck House Cruiser	speed 12 miles, guaranteed
30 ft. Elco Express	speed 20 miles, guaranteed

Visit our plant, inspect these boats, and handle them yourself, or send for our literature and then make your own comparisons.

can spend many happy days contemplating this work of the Infinite.

COLORADO

Probably one of the most interesting sections of the country from a vacation standpoint is Colorado. The extremely high altitude and the fine mountains and the fact that Colorado is "where the West begins" make it most attractive.

For those who, being city lovers, cannot tear themselves away from metropolitan surroundings Denver presents everything they may wish, together with a climate so cool and invigorating as to be always comfortable. Within a stone's throw and most easy of access are the Denver Mountain Parks, that are truly the most natural of playgrounds.

Within four hours' automobile ride of Denver—a trip so exquisite as to be never forgotten—Rocky Mountain National Park is reached. In another direction, just an hour or so by train, is Colorado Springs, with all its famous attractions—Pike's Peak, Manitou, and the Garden of the Gods.

A little farther on to the south is the

Mesa Verde National Park, and in the opposite way, after crossing the Continental Divide on the interesting Royal Gorge trip, is Glenwood Springs, a fine vacation resort. Colorado, with its good roads and many municipal automobile camping sites, is truly a motorist's Mecca.

CALIFORNIA

So many people think of California merely as a winter resort with a tropical climate that they are often surprised to find it quite as agreeable in summer. California is truly a medley of all-year-round resorts and can be visited any season of the year most comfortably. Its climate is never tropical at any time.

It would take more space than I have at my command to describe comprehensively the charm of all the California resorts. Beginning with San Diego and Coronado, and working up north along the coast through La Jolla, Long Beach, Santa Barbara, and Del Monte, one can find a succession of fine beach resorts of great beauty and with magnificent hotels all along the way.

In northern California the country around Mount Shasta is very beautiful

and there are many interesting resorts where those who love the mountains can find enough to do to keep them occupied all summer. East of San Francisco, in the Feather River Canyon and at Lake Tahoe, is another next-to-nature type of country with plenty of fine mountain lodges, very comfortable and attractive.

From Los Angeles there are enough side-trips to keep one going indefinitely for weeks, with excursions into the orange grove region (Riverside and Pomona), to Catalina, to Pasadena, and so forth.

OREGON AND WASHINGTON—THE PACIFIC NORTHWEST

It would take more than one article to speak adequately of the Pacific Northwest, for both Oregon and Washington are wonderlands of marvelous scenic resorts. In Oregon, Crater Lake National Park, as described before, is one point no tourist must miss. One's itinerary should always include a stop-over in Portland long enough to include a trip over the finest automobile highway in the world—the Columbia River Highway. This wonderful road is built along the north bank of the Columbia River, and there is no scenery anywhere to equal this. A splendid hotel has been built to accommodate those who wish to stay in this charming spot for a few days.

An almost unknown section of Oregon, though exceedingly beautiful, is the Mount Hood region. The hardened mountaineer finds a great deal to interest him in exploring its seven interesting glaciers, while the less hardy will delight in the innumerable trails which have been built by the Forest Service and which can be negotiated either on foot or on horseback. Unfortunately, however, the hotel accommodations in this region are not adequate nor very comfortable and one must "rough it" to see this part of Oregon.

There are also some very fine beaches along the west coast of Oregon, the most popular being Gearhart and Seaside, about one hundred miles from Portland.

Seattle, in the State of Washington, is charmingly located on Puget Sound. Standing on one of its many hills, the exquisite view of the Olympics on one side and Mount Rainier on the other is a never-to-be-forgotten sight.

For those who can loiter a while in Washington there are innumerable resorts of infinite charm. Lake Chelan, for instance, is a lovely spot with splendid fishing. Of course Mount Rainier National Park is another. The many little islands in Puget Sound, each with an individuality of its own, are perfect little gems. The wonderful Olympics—an almost unexplored region—are surely fascinating for those who seek something quite "different."

CANADIAN ROCKIES

Into a comparatively small area in western Canada is packed some of the most magnificent scenery in this hemisphere. The richest of this Canadian Rockies scenery is from Banff to Revel-

stoke. This is truly named the "Switzerland of America." The mistake is often made, however, of dashing through this splendid country without making more than two stop-overs. These are generally at Banff and Lake Louise, but there is much to do and see at Glacier, Field, Golden, and Revelstoke, and the tourist should allow enough time to see them all.

ALASKA

A truly restful and interesting water trip, and one which rounds out a transcontinental tour immensely, is the inland route to southeastern Alaska, with a side-trip to the Atlin Lakes. The latter is taken from Skagway. The whole tour takes about twenty days and is comparable with the noted fjords tours in Norway. Here too, in certain periods of the year, the midnight sun is seen.

A FEW SUGGESTED ITINERARIES

From the foregoing résumé the reader has some idea of the possibilities of touring in this country. The interesting thing about transcontinental touring is that there is a diversity of routes from which to choose and one can plan perfect circular tours without the necessity of retracing one's footsteps.

Most routes begin at Chicago. One fine trip is to start west by a northern route, including Glacier National Park (or by way of the Canadian Rockies), to the Pacific Northwest; then south to California as far as Los Angeles. From there the return trip can be made by way of the Grand Canyon. Or an alternative return trip can be made via the Zion Canyon National Park, Salt Lake City, Yellowstone National Park, Rocky Mountain National Park, and Denver, and then to Chicago.

An exceedingly interesting tour including several National Parks starts at Chicago; thence to Denver and Colorado Springs; to Salt Lake City by way of the Royal Gorge; to Yellowstone National Park; to Los Angeles, with a possible stop-over at Zion Canyon National Park *en route*. From Los Angeles numerous side-trips can be made. Then along the coast to San Francisco, from which point the tour of Yosemite and the Big Tree region is made. Then north to Crater Lake National Park and Portland, to Mount Rainier National Park and Seattle, and return either by way of Glacier National Park or the Canadian Rockies.

Increasing interest is being manifested by California tourists in the new route to San Diego through Imperial Valley and Carriso Gorge—California's newest scenic marvel. The construction of a line from Yuma west completed the shortest and most direct route by many miles between Chicago and San Diego. The difficulties surmounted mark an epoch in modern railway engineering. That part of the line through Carriso Gorge, consisting of eleven miles, cost approximately \$4,000,000. The views afforded and the contrast of coloring in the rock formation are really wonderful.

Another interesting tour begins at New York. By steamer to New Orleans;

COLGATE'S

Safe and Efficient

Just one set of teeth, to last the rest of your life. Is it sensible to experiment with them by using gritty, druggy dentifrices that claim to do the things that only strong chemicals can do?

The reason why more dentists recommend Colgate's than any other dentifrice is that Colgate's **CLEANS THE TEETH**, surely, efficiently, **SAFELY**—and makes no absurd claims to do the miraculous.

COLGATE & CO. Est. 1806 NEW YORK

Truth in advertising implies honesty in manufacture

GOOD TEETH—GOOD HEALTH

from New Orleans through San Antonio and El Paso to the Apache Trail and the Roosevelt Dam in Arizona; thence to Los Angeles. From Los Angeles the return can be made to San Francisco; from San Francisco through the Feather River Canyon and Royal Gorge to Colorado Springs and Denver, with a side-trip to Rocky Mountain National Park, and from Rocky Mountain National Park back to Chicago and New York.

Another interesting way to reach the coast is via the Panama Canal. Very comfortable and quite luxurious steamers make this trip to Los Angeles and San Francisco about once a month.

MANY Outlook readers will doubtless be interested in certain of the vacation points mentioned in the above article. The Outlook will, upon request, see that full descriptive literature on any point of interest is forwarded to any reader.

Real Estate

PENNSYLVANIA

FOR SALE
Colonial Type Brick Building

133 by 42 ft., 2½ stories, slate roof, situated in a college town on a main artery of travel north and south, with Lincoln Highway adjacent. Contains 30 rooms arranged in suites of two, each room with lavatory and connecting bath. Has swimming pool, 40 by 30, in the building. A glass-enclosed corridor connects a 1½-story building, 84 by 42, of the same construction, with the main building. These buildings would be suitable for an inn, as they are located on a corner, across the street from 600 students. Have steam heat, gas, electricity, connected with sewer, and pure mountain water. The soft water makes the swimming delightful. The buildings were erected in 1915, and are all in first-class condition. Immediate possession and good price to quick purchaser. Inquire of 7,485, Outlook.

FOR SALE

Three acres of land with fruit orchard, four-room and bath brick house, furnished with antique furniture; also attractively furnished studio and garage. Three minutes from the lake. Beautiful private location. Cash, \$4,800. Nine miles from Stroudsburg and Delaware Water Gap. Apply to E. G. DORSHIMER, Postmaster, Saylorsburg, Pennsylvania.

VERMONT

For Sale in CHARLOTTE, VT. on Lake Champlain. 10-room cottage, garage, icehouse; about 2 acres. Beautiful scenery, high and dry. Mrs. C. A. Austin, 28 Reynolds Terrace, Orange, N. J.

Guardians of the Circuits

The telephone at your elbow seems so simple an instrument, it does its work so quietly and quickly, that it is difficult to realize the vast and complex equipment, the delicate and manifold adjustments, the ceaseless human care "behind the scenes" in the central offices.

Behind the scenes is the terminal of all the underground and overhead lines on the streets and highways. Here are the cable vaults; the great steel frames containing the thousands of separate wires and fuses for the subscribers' lines; the dynamos and storage batteries; the giant switchboards through which your telephone is connected with the other thirteen million telephones in the Bell System.

And here, in charge of this equipment, are the guardians of the

circuits—the wire chief and his assistants—master electricians and experts in telephony. Their first duty is the *prevention* of "trouble." By day and by night they are constantly testing the central office equipment, the overhead and underground lines, the subscribers' individual wires. And when, from some cause beyond control, "trouble" does occur, nine times out of ten it is repaired before the telephone subscriber suffers the slightest inconvenience.

It is the skill of the men behind the scenes, together with scientific development and construction, efficient maintenance and operation, which make it possible for you to rely upon the telephone day and night.

BY THE WAY

"DID your brother have any luck when he was hunting tigers in India?" asks Mr. Smithwick, as reported in the "Irish World." "Yes, sir, great luck—he never met any."

A college paper, the Toronto "Goblin," tries its hand at free verse, thus:

EVER?

Have you ever been
Introduced to your chum's
Fair affinity, and
Immediately she tries to
Gather you in?
But you remember that he's
Your chum, and consequently
Act rather cool towards her, and
Straightway she advises
Your chum to shun you, because
You are no fit
Companion for him.

The old clipper (or semi-clipper, to be exact) *Glory of the Seas*, which was built by McKay, of Boston, in 1869, and which held the record for her class of craft between Australia and San Francisco of thirty-five days' sailing time—"a record that was never equaled by any square-rigged, three skysail yards vessel," a nautical authority says—is now being dismantled. The *Glory of the Seas* is known to veteran seafaring men in all ports of the world, it is said, for she had sailed on all the seven seas for two generations. Her passing brings a shadow of sadness to lovers of the grand old ships of the last century.

The old-time frontiersman's horse was close to his heart, and sometimes received the tribute of honorable burial when the end came. Some of the inscriptions above the graves of these favorite horses, as quoted in "The Cowboy," by P. A. Rollins, tell the story with simple eloquence. Here are three:

The Devotion of the Man
who Erected This Stone.

The New York City Telephone Directory is perhaps the most wonderful collection of surnames in existence. An one in an idle moment may make interesting discoveries in it. For instance there are in the directory—Dumas with Porthos, Athos, and Aramis; Dickens and Pickwick; Thackeray and Newcome; Walter Scott and Marmion; Othello and Hamlet; Swift and Smollett; Macaulay and Carlyle; Dante and Byron; Raphael and Velasquez.

CLEAN MILK FOR THE METROPOLIS

BY SHERMAN ROGERS

A Special Introductory Offer

The Next 13 Numbers Of The Outlook Only \$1

EVERY issue of The Outlook is read by many people who are not regular subscribers. In order to make it possible for occasional readers to become better acquainted with the character of the journal and to see it regularly each week for a trial period at but slight expense, we make the following special offer:

We will send The Outlook each week for the next three months (13 numbers) for the small sum of \$1 to any one who is not now a subscriber. The regular yearly subscription price is \$5, and this offer is made to non-subscribers in order to show them what they are missing by not having The Outlook each week.

Why You Will Need The Outlook During Your Summer Vacationing

Wherever your summer jaunts may take you, The Outlook will reach you each week. Due to a remarkably efficient change-of-address department, we can guarantee immediate action on all change-of-address orders received by us. Other periodicals often require from two to six weeks to get action on such orders. But no matter how often, or how quickly, you change your summer whereabouts, The Outlook will be there each week to keep you clearly, reliably, and authoritatively informed as to what is happening in the world. Many of our readers will get along without newspapers this summer—but not without The Outlook.

A Journal Read By Statesmen

Each number contains hours of reading, all of which is bracing, refreshing, and brain-expanding. Distinguished contributors write for every issue. The fascinating running story of the world's progress is prepared for you by eminent journalists, statesmen, diplomatists, scientists, men of letters, artists, educators, and business men. The terse weekly editorial summary and interpretation of the world's news is world-famous. In Japan, for instance, according to one of the leading Japanese publicists, The Outlook is the most popular of all American periodicals. At home it is the most-quoted periodical on the floor of Congress.

"The Most-Quoted Weekly Journal In America"

You have noticed, of course, that the leading newspapers of the country are almost constantly quoting from The Outlook, which is noted for getting hold of

articles of such sharp and timely interest and importance that their publication is actually a matter of news. But why rely upon the fragmentary reports in the newspapers, when you can have the entire, unabridged contents of each week's issue of The Outlook before you for the next 13 weeks for the small sum of only \$1?

By starting your trial subscription at once, you will be sure to get all of the striking articles that are scheduled for the summer.

Engrossing Exclusive Features

FIRST in position and importance in each issue of The Outlook is the editorial survey of the outstanding events of that week, discussed without partisanship or prejudice and with first hand knowledge and conviction.

LYMAN ABBOTT, dean of American editors, frequently contributes signed editorials.

SHERMAN ROGERS, who has been described as a journalistic thunderbolt, and has in the short space of two years made himself known from coast to coast, is on his way to Alaska and will describe for readers of The Outlook the places in Alaska that President Harding and party will visit this summer. Mr. Rogers also contributes "Glass Bottles and Common Sense."

SECRETARY OF LABOR DAVIS expresses some arresting views concerning the kind of immigrants who are thronging to our shores.

NEWTON FUESSLE, whose recent exposé of America's "athletic trust" started a widespread controversy, contributes the inside story of Washington's war on civil service; also the story of Uncle Sam as a gigantic road builder, and the dramatic story of how Albert D. Lasker is trying to cut down the loss of \$50,000,000 per year which is the appalling cost of maintaining in idleness the vast fleet of ships on our hands.

ELSIE SINGMASTER, the American novelist, is represented by a searching short story entitled "The God in the Machine."

W. B. MAXWELL, the famous English novelist, contributes a distinguished short story entitled "The Romance of It."

THE GREAT ITALIAN HISTORIAN, Guglielmo Ferrero, will contribute an article on world conditions, "Order or Disorder,"—a masterpiece of cumulative power.

"AND NOW THE FLAPPER TEACHER," by Angela Keyes, and "THE AMENITIES OF SCHOOLMASTERING," by Howard Bement, two educational articles of exceptional timeliness, will soon appear.

HENRY HOYT MOORE, The Outlook's staff photographer, contributes a group of extraordinary photographs of the Storm King Highway.

"SOME OF THE GOOD AND BAD IN GHANDIISM," by the Rev. R. A. Hume, is an important feature, fresh from India.

ROBERT H. MOULTON contributes "How Birds May Save a Billion Dollars' Worth of Foodstuffs in a Year."

THE BOOK TABLE, a feature each week, is conceded to be one of the really important literary departments appearing in American periodicals.

NEW PRIZE CONTESTS will be announced from time to time. Substantial cash prizes will be awarded to writers of winning letters.

By signing the coupon to-day and mailing it to us with your remittance you will receive one of the biggest and most useful and refreshing dollar's worth of reading ever offered.

THE GENOA CONFERENCE ENDS

EITHER diplomacy is getting blunter or the blunt things that diplomats used to say to one another in secret are now being sent over the wires or through the ether. At Genoa there have been some frank speeches. Perhaps one reason why some observers are despondent about conditions in Europe is that they interpret this frankness as a symptom of international explosiveness. Those same observers would possibly have been more despondent if they had known of the explosiveness that existed in other days when frankness was not so common. When a safety-valve goes off, it may sound terrifying, but it is not deplored by the man who knows something of steam pressure.

Among the frankest speeches at Genoa was one made the other day by M. Colrat, of the French delegation, in reply to the Bolshevik delegate Tchitcherin's objection to the absence of Russia from the committee which deals with labor problems. M. Colrat said: "We felt that the Russians came so rarely to the meetings that they were unqualified to share in the discussions. The head of the Russian delegation is little justified, considering the present economic conditions of his country, in giving lessons to other countries." That is a sensitive point, not merely for Russia, but for some of the other nations which have met at Genoa.

Equally frank and very much to the point was the homely and direct scolding Mr. Lloyd George gave Russia in his speech at the final plenary session. He was optimistic to the extent that he thought that "the mixing of nations at Genoa had brought the Russian problem from the stage of jungle prejudice swarming with wild suspicions, to the cold, calm, and expert examination with which it will be treated at The Hague." Extremely plain-spoken was Mr. Lloyd George's comment on the Russian attitude as to finance. He said:

First, if a man sells goods to another he has a strong prejudice in favor of payment for them. Second, if he lends money he has a strong prejudice in favor of repayment. And, third, if he lends money and his debtor comes to him asking more the creditor will ask about the first loan, and if the debtor replies that it is against his principles to pay his debts he is sure to come against a preju-

dice deep rooted in the foundations of Western civilization.

The adjournment of the Conference on May 19 has caused some relief. The Conference during its sessions has perhaps revealed more clearly than ever before divergencies in policy between great nations. It has given the Russian Bolsheviks a new lease of life. It has occasioned in many minds new fears for the future. But it has at least not brought about new conflicts. Its chief fruit is a temporary agreement for non-aggression in Europe and the reports of its various commissions, which may provide facts on which future action can be taken.

TURKISH ATROCITIES

BRIEF Associated Press despatches from Paris and London state that the French Government has accepted the invitation of the British Government to join in an official investigation of the alleged Turkish atrocities upon the Armenians. It is also reported in the same despatches that the British Government has invited, or proposes to invite, other Allied Governments and the Government of the United States to join in the investigation. Whether the United States and other Allied Governments accept the invitation or not, the British Government will send a special commissioner to Asia Minor. Thus we are assured that the long agitation against Turkish atrocities in Asia Minor, which has been reported from time to time in *The Outlook*, has produced results. France and Great Britain have taken action and hope that the American Government will join in this action. Unimpeachable evidence has been published from time to time in the newspapers of Europe and America and has come to us in private letters that Turkish officials in the Near East have persisted in the treatment of subject peoples which has given Turkey an unsavory reputation in the civilized world for more than half a century. It is said in defense of Turkey that some of the most engaging gentlemen of modern times are found among the educated Turks. If this is so, such Turkish gentlemen and citizens should do everything they can to co-operate with an official investigation in order to remove the stigma from their national name.

Whether it is possible for the Allied Governments or for the American Government to put a stop by force to atrocious government on the part of the Turks is another question. But, at all events, the civilized world is entitled to know the facts. The step which Great Britain has taken and in which France is going to co-operate is a testimony to the value of persistent protest on the part of private citizens against international wrong-doing.

THE COAL LABOR WAR

THERE are few, if any, signs of peace by negotiation in the dual coal war.

The anthracite miners and operators have bargained with one another through sub-committees, but seem to disagree as badly as ever. This branch of the industry has at least carried out the agreement to negotiate for renewal and possible revision of contracts. The anthracite situation just now is that the operators have offered and the workers have refused a plan of agreement. Briefly, the operators propose a reduction of contract rates of 18 per cent below the rates fixed by the Anthracite Coal Commission in 1920, with day rates of men, boys, and laborers in proportion. Their argument is that the 1920 rates gave the miners earnings in excess of the cost of living at that time, and the cost of living has now been reduced by over 24 per cent—in view of which the miners' request for an increase is, say the operators, absurd.

The proposal of the anthracite operators also includes a commission to meet on March 1 each year if a joint committee of mine workers and operators have not agreed in February on a wage rate for the year. This joint commission should determine the proper wage rate. This commission should consist of five men to be appointed by the Presiding Judge of the United States Circuit Court of Appeals from the Third Judicial Circuit. Its membership of five should consist of a mining engineer and geologist not connected with coal mining; an economist of established reputation; a judge of the United States Court for the Eastern District of Pennsylvania; a man representative of the labor movement in the anthracite field; and a man who has had to do with the mining and selling

of anthracite. The commission should have to do with the wage-rate question only; other relations to be covered by a five years' contract.

The anthracite miners have refused this proposal, chiefly on the ground that they consider that it would deprive the unions of the power and right to bargain collectively or to strike for needed improvements. Precisely why it should do so does not appear clearly in such statements as we have seen.

In the bituminous field the most important development has been Secretary Hoover's urgent request to the operators to make profiteering and high prices for coal during the strike impossible. Secretary Hoover is reported to have told the operators that "the coal industry would either govern itself or the Government would govern it." He made it perfectly clear that he did not desire to see the Government interfering in private business, but that the public interest must be cared for.

The operators to whom Mr. Hoover spoke accepted in principle the idea that a voluntary and temporary agreement for a sort of clearing-house committee in each coal district should be adopted. Each of these committees would have the duty of seeing that coal is distributed fairly to the industries that need it and that prices should not be allowed to get out of control even if that result should require certain restraint on the fixing of prices. It is hoped that the plan will be accepted by the many hundreds of bituminous operators when it is placed before them.

REGULATING THE INVESTMENTS OF INSURANCE COMPANIES

THE housing situation of the great cities of the country, especially New York City, has led some undoubtedly well-meaning persons to say that the funds collected in trust by the great insurance companies should be used (if necessary under legislative compulsion) to build homes for the people. It is quite proper that the lawmaking power should carefully regulate the financial operations of insurance companies, savings banks, trust companies, and other similar institutions, for such institutions are trustees for the people, and they should be inspected and regulated by law like trustees under a will. They should be told and are told—at least insurance companies and savings banks are told—that they may invest the funds intrusted to their charge only in certain kinds of securities and financial operations. But this is as far as the legislature should go. If the legislature attempts to say to an insurance company or a savings bank, "You must put

so much of your trust funds in this kind of a security and so much in that kind of a security," the legislature then supplants the trustees in these public institutions and becomes sole trustee itself. It is not the function of the legislature to determine the details of such investments. No legislature has the time or capacity for such work. Its function should be regulatory and investigatory simply. Under a mistaken agitation which has been carried on in New York City during the past several months, the New York Legislature has passed what on the face of it appears to be a permissive act but is really in its moral effect a mandatory act compelling one of the great insurance companies to put a very large sum of money into the building of houses and apartments. This particular law may not be bad in itself, but it opens the door to very pernicious legislation.

The insurance companies and savings banks have been very reluctant to protest because of the fear that such a protest would be regarded by the public, which is not always very careful in its inferences, as a protest against regulation. We are therefore very glad that the Insurance Commissioner of Massachusetts, a State official, introduced in a recent meeting of Insurance Commissioners of the United States a resolution, which was apparently passed with unanimity, condemning the tendency in "several States during the past year" which "have contemplated legislation whereby insurance companies or certain classes of insurance companies would be required to invest certain proportions of their assets in designated forms of investment or in securities and investments having their location or origin in such States." The general ground upon which Commissioner Hobbs's protest is based is as follows:

Be it resolved that the convention record itself as of the opinion that the soundness and efficiency of insurance companies and the prompt payment of their obligations is of paramount importance to the community wherein they make insurance upon property and lives and that the legislatures of the several States should aim at maintaining that soundness and efficiency rather than seek to divert their funds to uses inconsistent therewith.

The function of a mutual insurance company is to receive the premiums of its policy-holders and so invest them that it not only can pay the face of the policy when due but can, in addition, pay a dividend upon the premiums themselves. The function of the savings bank is to receive the deposits of its clients and so invest them that they can be paid back when called for, with an appro-

priate dividend. To perform these functions requires the most careful, well-trained, and constant devotion to honest and efficient finance and industrial development. This kind of knowledge can be attained only by men who are in constant touch with the work; and a legislator cannot give this constant attention. He can only say to the trustees of insurance companies and savings banks: "You must be honest and open; your investments when inspected must prove to be sound; and you must not use the funds of your beneficiaries in speculative purposes; therefore, there are certain classes of investments to which we limit you, but within those classes you are to use your own best judgment as to the character, the amount, and the location of the investment."

ORGANIZED BUSINESS GOES TO SCHOOL

ORGANIZED business has become interested in everything that promotes the well-being of the community, for it now recognizes that it can prosper only as the community prospers. This is why Chambers of Commerce are becoming educational institutions serving for the exchange and promotion of ideas for the benefit of the community as a whole.

This trend was never better illustrated than at the tenth annual meeting of the Chamber of Commerce of the United States, held in Washington, May 15-18. From its platform thousands of business men hailing from every State in the Union listened to discussions of the vital questions of the times from the lips of such men as President Harding; Secretaries Hughes and Hoover; A. D. Lasker, of the Shipping Board; Dwight W. Morrow, of J. P. Morgan & Co.; Mr. Howard, the head of the Federation of Farm Bureaus; and many manufacturers, merchants, and labor leaders. While the main themes were foreign affairs and their relation to American business and an American merchant marine, many technical and civic questions relating to housing, manufacturing, merchandising, immigration, etc., were analyzed and discussed. All these problems were approached from the various points of view of representative bankers, merchants, manufacturers, farmers, and labor.

If one may judge the temper of American business thus represented by its leaders and expressed by their applause, it strongly approves of the views of President Harding and his advisers regarding the necessity of basing international action upon a code of practice which demands respect for obligations, contracts, and the inviolability of pri-

vate property rights. Both Secretary Hughes and Secretary Hoover emphasized this. President Harding, amid applause, urged the promotion of the exercise of conscience in business. This was amplified by Secretary Hughes, who pointed out that protection of American interests abroad "involved a certain measure of reciprocity" in the relations of the Department of State and business men. "This Government is not engaged in endeavoring to promote the opportunities of chicanery," he said. "Business interests in their dealings abroad are under a patriotic obligation to maintain the prestige of their country."

The delegates were keenly interested in the growth of the practical service which the Department of Commerce is rendering to American business. The Chamber went on record as advocating "an adequate privately owned and privately operated merchant marine under the American flag" receiving Government aid. It urged American representation on the Reparation Commission, and an International Court of Justice; the formulation of a plan for settling the claims of the United States and its citizens against the Governments of Germany, Austria, and Hungary and their nationals; that the basic railway law be continued; that the Army and Navy personnel remain adequate for National defense; and that passport requirements and other red tape in connection with international travel be abolished as soon as possible. In his address Secretary Hughes approved of reduction of passport restrictions and said that the present receipts of the Department of State, or Department for Peace, as he styled it, from viséing passports and other sources had made his Department a money-making institution, as receipts were more than a million in excess of expenses. He argued for a better-paid foreign service as one of the means of promoting business.

The meeting might be called a great business university.

THE SHOE MACHINERY CASE AND THE CODE OF INDUSTRY

AMONG the decisions of the United States Supreme Court that have determined fundamental principles of industrial practice and have built up a code of industrial rights is the recent decision in the case of the United Shoe Machinery Corporation. In particular, this decision makes more definite the bounds of what the law declares to be forbidden monopoly. It comes, therefore, in a direct line of succession to those decisions reaching backward into the distant past, by which the law both

in this country and in England has undertaken to protect society against economic tyranny. Not all monopolies are illegal. Patent rights, for example, are virtually forms of monopoly which the law recognizes in order to encourage invention by assuring inventors undisturbed enjoyment of approximately just reward for their service. It is the adjustment between public rights and private rights that has created the problem in this case.

By virtue of its ownership of patents, the United Shoe Machinery Corporation, which the Supreme Court calls for brevity's sake the United Company, controls ninety-five per cent of the business of supplying shoe factories in the United States with the machinery for use. Instead of selling that machinery, the United Company has followed the practice of leasing it. It supplies machines of excellent quality; installs them; gives instructions to operators as to their use, and furnishes its machines to manufacturers with promptness, keeping them in repair, and, when necessary, replacing them. In leasing these machines the United Company has been in the habit of laying down conditions which the manufacturers are required to observe.

In a suit under the Sherman Anti-Trust Law the Government failed to secure the dissolution of the company or any injunction against the leases.

Later, however, a new law was placed upon the statute-books, known as the Clayton Act. This law forbids persons engaged in inter-State commerce to lease machinery, whether that machinery is patented or not, on the condition that the lessee shall not use or deal in the machinery or other commodities of a competitor of the lessor, where the effect of such leases would substantially lessen competition.

It is under the Clayton Act that the Supreme Court has now found these leases illegal. For example, one of these leases provides that the machinery shall not be used upon shoes upon which certain other machines of the company have not performed operations; and another clause provides that the lessee shall purchase supplies from the lessor. The effect of such leases makes it practically impossible for a factory to get necessary machines from the United Company if it uses machines of competing companies. The lower Court (the District Court of the United States for the Eastern District of Missouri) decided against the United Company, and enjoined the use of such clauses in these leases, and the United States Supreme Court has affirmed the decision of that district

Court, and made these leases finally and irrevocably illegal.

PATENT RIGHTS, AND MONOPOLIES CONTRARY TO THE CONSTITUTION

THE Supreme Court points out that the right secured by patentees does not give them the liberty to lease machines upon conditions prohibited by a valid law of the United States. It is true patentees have the right to restrain others from using their inventions, but do not have the liberty to impose conditions which are contrary to a Constitutional law.

It was argued by the United Company that Congress had not the Constitutional power to put this limitation upon the use of these patents because by doing so it would take away from the patentees without due process of law rights which they had. The Court answered, however, that from early decisions the patent right has consisted only in the right to exclude others from making, using, or vending the thing patented without the permission of the patentee, and that it gives the patentee no more than the exclusive right to make, use, and sell the invention. It does not destroy the right of the States to exercise their police power or the authority of Congress over matters within its Constitutional power. Congress has a right to deny the protection of patent rights to such covenants as come within the terms of the Clayton Act. It is argued that alternate forms of leases were offered by the United Company to the lessees, and that these leases under litigation have been chosen by the lessees instead; but the Court answers that this does not justify the use of the illegal leases that were before the Court.

There seems to be no charge that these leases were used oppressively. What the Court objects to is the fact that these leases gave the company power to act oppressively.

It seems to us that this is an instance in which the Supreme Court has proved its skill to guide law with safety through the tortuous channel of modern industry in such a fashion as to avoid, on the one hand, the rock of interference of private rights, and, on the other hand, the rock of arbitrary monopoly. Of course it is not the business of the Court to decide whether the law is wise or not; but, as case after case has shown, the Supreme Court, in determining what the law actually is, has had to exercise a discrimination between the law as mere words and the law as a living organism. In this case it seems to us that the Court has exercised that discrimination, and

has discerned the truth that men in their relations with one another must be governed, not only by the statute, but also by the rule of reason.

A COMMENDABLE JUNKET

A TEMPEST in a teapot has been stirred up in the United States Senate over the proposal of Mr. Denby, Secretary of the Navy, to take the surviving twenty-seven members of the Naval Academy class of 1881 to Japan on a transport in order to hold a reunion of the class in Japan at the invitation of Admiral Uriu, of the Japanese navy, who is a member of the class. Mr. Weeks, Secretary of War, is also a member of the class. The plan has been made by Secretary Denby, with the approval of President Harding, who believes that the acceptance of this invitation from Japan to this kind of an international reunion will be a contribution towards the growing friendship of the two countries and their mutual understanding.

Senator McCormick, for some reason which he has not made plain, introduced a resolution in the Senate protesting against the use of a naval transport and saying that the members of the class ought to go on a merchant vessel. His objection is evidently not based on the matter of expense, because we understand that he is ready to make an appropriation to carry the class to Japan on a merchant vessel. We hope the President and the Secretary of the Navy will ignore the resolution and will carry out their plan of taking these twenty-seven present and former members of the Navy on a Navy transport. It seems that there is a transport going to Japan on Government business, and that the reunionists can quite easily and properly be taken along. We only wish that they could go on one of our very best battleships instead of a transport. We can think of no better way of spending naval money than by sending a battleship on such a friendly and peaceful mission to the Japanese people.

A BEAUTIFUL MONSTER

IN his remarks before a large party of invited guests gathered at a luncheon on the Majestic in honor of her first voyage to America, Mr. P. A. S. Franklin, President of the International Mercantile Marine Company, jokingly said that he had been strictly enjoined by his publicity manager never to mention the Majestic by name without adding, "The world's largest ship." The new White Star ship is certainly that, for she is 956 feet long and her gross tonnage is 56,000, which is 2,000 tons in

(C) Kadel & Herbert

THE MAJESTIC, THE LARGEST TRANSATLANTIC LINER, ARRIVING AT HER DOCK IN NEW YORK CITY

excess of the Leviathan—a name which we are glad to know is not to be changed because of President Harding's good taste and good sense.

Some other superlatives might well be applied to the Majestic as well as "big;" she carries comfort over into the domain of extreme luxury; her public rooms are more spacious than even those of her young sister the Homeric; she consumes eight hundred tons of oil a day in her twelvescore furnaces; she has the power of a hundred thousand horses; she has nine steel decks, elevators, an extensive swimming-pool, and is surpassed by none of her big rivals in decorative art. Moreover, her first voyage, in which no special effort was made for speed, averaged nearly 23 knots per hour and at times exceeded 25½ knots, from which her admirers are beginning to predict that her speed may come to equal her bigness and her luxury. They even speculate as to the possibility of her wresting the transatlantic time record from the Cunarder Mauretania, which has long been in the speed supremacy and in one run from Daunt's Rock Lightship to Sandy Hook maintained an average speed of 26.06 knots for four days ten hours and forty-one minutes.

Seagoers and sailors are inclined to prefer the fine lines of the old time and smaller ocean-goer to those of the new giants; even the Majestic's captain, Sir Bertram Hayes, at the luncheon already referred to, dropped a side remark of that kind in his speech accepting congratulations on his first voyage and his fine ship. But, if less delicate of line, the new big fellows (if one may call a ship a fellow) assuredly have massiveness and impressiveness, and their very bigness adds to their possibilities of pleasure-giving. There is always room for two classes of steamships to suit two classes of travelers—those who want the last word in hotel-like luxury and pay for it, and those who want comfort at moderate cost. This year's bookings to

Europe from America have been taken up eagerly by both classes of travelers. There has been no indication in this direction of hard times or bad business.

FIRST PURE. THEN PURIFIED

BEHIND the pasteurization of milk in New York City, described by Mr. Rogers elsewhere in this issue, there is, as Mr. Rogers implies, a story which he does not tell.

The condition under which the milk used by little children as well as adults in the metropolis was produced, transported, and distributed twenty years ago would not be tolerated to-day. Little or no supervision was given by the city authorities, or by any one else acting on behalf of the public, to the conditions on the farms which produced the milk. The cows on a farm might be diseased, the stable might be filthy, the handling of the milk might be careless. There was very little control of the methods of transportation. Some of the milk which came from sources forty hours distant—some of it, in fact, came from as far away as Canada—might be allowed to remain during much of its journey in a temperature in which harmful germs would flourish. When the milk reached the city, it was distributed by methods which often not only permitted the germs in it to develop but made it inevitable that it would be tainted by new impurities.

Under such conditions, the little child which depended for its food upon this milk was helpless against daily peril, and adults were without means of knowing whether the milk supply they were giving to their children and using for themselves was a food or a poison.

As a consequence of the efforts of public-spirited citizens there was formed, under the auspices of the New York Association for Improving the Condition of the Poor, in 1907 what was known

as the New York Milk Committee. The members of this Committee were all volunteers, serving without remuneration. Of this Committee at that time Mr. George W. Wickersham, later Attorney-General of the United States, was chairman. It was my good fortune to be permitted to serve as one of the members of the Committee.

Great pressure was brought upon that Committee to have it advocate as a policy the pasteurization of the city's milk supply. It was shown beyond reasonable doubt that such pasteurization would destroy the injurious effects of the impurities in the milk, and those who were impressed by the results of Mr. Nathan Straus's noble philanthropy which provided milk stations where mothers could get pasteurized milk for their babies were puzzled because the Committee did not at once agitate for municipal pasteurization. There was of course an element in the city which was ready to obstruct any reform on the grounds of expense, but that element had little effective influence in retarding measures for improving the city's milk supply. The reason why the Committee did not at first urge pasteurization was that if a dirty supply were pasteurized the city would acquire a sense of security that would make it seem unnecessary to have the supply made clean. The time for pasteurization was not to arrive until the city exercised its authority to insist that its milk supply should first be protected against dirt and germs. So the Committee set itself to work to develop methods for cleaning up.

In this early process of educating public opinion and the civic authorities to the need of inspection and control of the milk supply for insuring its cleanliness from start to finish no one gave more practical services than Mr. Loton Horton. As Mr. Rogers says, Mr. Horton has done service in working out a practicable method of commercial pasteurization, but we hope that his service during those earlier days in seeing that the milk which he now pasteurizes should come to the city clean will not be overlooked or forgotten.

There may be farmers to-day who represent the city's assumption of power to tell them how to care for their cows, how to milk them, and how to handle the milk; but the intelligent farmer to-day recognizes that because of the city's supervision the dairy business is on a basis of stability that it could never otherwise have obtained.

To-day the whole milk supply of New York City even before it is pasteurized is a more healthful food than any city's milk supply was a generation ago. This is because there were men who believed

that dirty milk was unfit food, whether pasteurized or not.

The New York City mother who gives what is known as Grade B Pasteurized Milk to her child can feel safer than even the farm wife who gives to her child the milk from the farm's own cows. Because of the regulations enforced by the municipal authorities, New York City milk has a known proportion of butter fat, it is as clean as it is humanly possible for a milk supply to be, and whatever enemy has found lodgment in it has been rendered harmless. It is to-day, in spite of the cost of production, inspection, selection, and purification, not only one of the most wholesome and well-balanced of foods, but one of the cheapest as well.

ERNEST HAMLIN ABBOTT.

GIFFORD PINCHOT

THE nomination by direct primary of Gifford Pinchot as Republican candidate for the Governorship of Pennsylvania recalls the interesting and dramatic days of the Progressive party, of which Theodore Roosevelt was the founder and the leader. The contest in Pennsylvania was one between the Independents or Progressives with Mr. Pinchot as their candidate and the Republican organization with the Attorney-General of the State, Mr. George E. Alter, as their candidate. The organization was so strong in Philadelphia and in Pittsburgh that it believed it could overcome any majority for Mr. Pinchot

(C) GoldenSky, from Keystone
GIFFORD PINCHOT

in the rural districts. But William Flinn, the old organization war horse and Republican boss in Pittsburgh, who followed Theodore Roosevelt out of the Republican party and into the Progressive party, so successfully supported Mr. Pinchot that the supposed majority for the regular organization was cut down in Pittsburgh and Allegheny County by a surprising amount.

Mr. Pinchot's nomination assures his election, and means that under his administration the government of Pennsylvania will be carried on in accordance with standards of honor and integrity. The partnership in this extraordinary primary campaign between Gifford Pinchot and William Flinn is an illustration of loyalty and the possibilities of a union of practical politics with high idealism which has for those who know the two men an element of romanticism.

Gifford Pinchot is the founder and the personification of the conservation movement in the United States. He was graduated from Yale in 1889; went abroad and studied forestry in Europe; and, coming back, began the first scientific forestry work ever undertaken in this country on the great estate of Biltmore, in North Carolina. He entered the Department of the Interior in 1897 under the McKinley Administration, and in 1901, under President Roosevelt, was made Chief of the Bureau of Forestry. In his autobiography Mr. Roosevelt states that he had become interested in forestry while Governor and that he even then corresponded on the subject with Mr. Pinchot. When Mr. Roosevelt became President, Mr. Pinchot laid before him the plans for a great National conservation movement, which Mr. Roosevelt took up with his characteristic enthusiasm. The conservation movement meant not merely the saving of our National Forests, but the conserving of all kinds of National efficiency, including the material and moral man and woman power of the country. It is this conservation in its broadest sense which Mr. Pinchot represents. He is not interested merely in trees, but in the farmers, the farm women, the farm children, and the little red schoolhouses of the country.

He has been in so many lively political and administrative controversies and conflicts during his official life that a good many people have a wrong idea of his pugnacity. As a matter of fact, when he thinks it is his duty to do a thing he does it no matter what friendships may be broken nor what feelings may be hurt. But personally he is one of the sweetest-tempered, most friendly, most sympathetic, and most unassuming of men. He combines in rather an unusual fashion some of the qualities of St. Francis of Assisi and Richard Cœur

de Lion. It is just possible that he will have a harder time with Pennsylvania than Pennsylvania will have with him, because his standards and abilities are so high that it is difficult sometimes for him to be patient with the defects and lack of energy in the average man and woman. But he is certainly not going to be an unpractical idealist as Governor of Pennsylvania, for he has had long administrative experience and has shown great administrative capacity.

It is a fine thing for Pennsylvania and the country, to say nothing of the Republican party, that the Republicans of Pennsylvania have chosen such a man to be their standard-bearer.

IS THERE NO PROTECTION?

WHEN the United States Supreme Court decided, as we reported last week, that the Federal Child Labor Law was unconstitutional, it decided something more than the question of child labor.

Perhaps, in the light of its previous decisions, the present decision was inevitable. A former law had excluded from inter-State commerce goods made in factories employing children contrary to provisions embodied in the law. This the United States Supreme Court declared to be invalid, because not within the Constitutional powers of Congress. Then the framers of that law decided to undertake to employ the taxing powers of Congress to the same end, and therefore drafted a measure which laid a tax upon such goods as the former law had declared non-transportable. As the layman understands it, it is on the ground that this attempt to use the taxing power is but a subterfuge to prevent child labor, and that the business of regulating or preventing child labor is not within the province of the Federal Congress, but is reserved to the States, that the Supreme Court, speaking with the voice of Chief Justice Taft, has rendered this law void also. It is reasonable, it seems to us, and we think it will seem to most people, to conclude that if Congress has no power to exclude child-made goods from inter-State commerce it has no power to put the burden of a tax upon them. The power to tax is power to destroy, and if destruction by direct prohibition is unconstitutional, destruction by taxation would seem to be unconstitutional likewise.

If this was only a question of child saving, the problem left by the decision of the Supreme Court would not seem to be insoluble. We must recognize that there are certain things which the Nation as a nation cannot do. Among the

dearest of human rights, there are many, including the right to life itself, which under ordinary circumstances are entrusted to the protection, not of the Nation, but of the States. The fact that the right to childhood is a precious right does not necessarily mean that it must be safeguarded by the laws of the Nation.

There is, however, a right which under this decision of the Supreme Court seems not to be safeguarded.

South Carolina, let us suppose, has an enlightened child labor law. The fact that it has not such a law does not interfere with our supposing that it has. It may have some day, and we hope it will; and when it does it will find itself in this case. The result of that law is that the cost of labor in its manufactures is higher in South Carolina than it is in the neighboring State, let us say, of Georgia. What can South Carolina do? If it were a fully sovereign nation, it could protect itself against the unfair competition of Georgia by levying a tariff to cover the difference in cost of production. By the Constitution, however, it is prohibited from doing that. So South Carolina appeals to the Federal Government and says: "You forbid me to protect myself; therefore I appeal for protection to you. Forbid the goods of Georgia, made cheap by child labor, to go across my frontier, or else put a tax upon them that will do what I would do by a protective tariff." And now the Supreme Court says: "No. You cannot protect yourself, and you cannot be protected by Congress. You have to pay the penalty for having been enlightened. You have to suffer because you choose to safeguard children's rights. The privilege of enacting child labor legislation is reserved to the States, and it is to be exercised by them at their industrial peril."

It is the theory of the law that for every wrong there is a remedy. What is the remedy for this wrong? We wish some Constitutional authority, who could speak with the same assurance that the Supreme Court has spoken, would tell us what it is.

PAINTINGS AND PEOPLE

THERE are a great many excellent paintings in the world. There are also a great many excellent people. The two ought to become better acquainted.

At the present time many of the pictures hang unseen in artists' studios or are stacked in piles awaiting those hopeful moments when they are inserted one after another in the artist's best exhibition frame, on the great easel

in the corner of his studio. Only too often, as artists know, the procession of pictures marches back to its stack again without any break in its ranks. The studio visitor may have greatly desired to love, honor, and cherish one of the briefly glimpsed pictures. But there are certain formalities in this material world which must be attended to before such a consummation can be realized. The most important element in these formalities consists in the passing of a check from the observer of art to the creator thereof. But checks do not grow on bushes, nor are there trees, in this climate at least, which fruit with three-square-meals-a-day. Both of these facts add greatly to the difficulties of the would-be consumer and the producer of art. There are many more people who like paintings than have the money to buy them.

So far as we know, one of The Outlook's friends has pioneered in an effort to solve this problem—a problem which possibly dates back to the days of Phidias. Not long since an artist of his acquaintance dropped in for an evening's chat. They started discussing the market for pictures, and our friend took the artist to task for his lack of business acumen.

"The trouble with you artists," he said, "is that you are a lot of misers. You are like men who hoard their money in an old sock stuffed away in the eaves. You ought to make your capital productive. Now take your own case. You have twenty or thirty pictures piled up in your studio, and I'll wager you won't sell more than three or four during the coming year. Why don't you rent the things and let them bring you in an income instead of doing nothing but collecting A1 samples of New York dust?"

"That's a grand idea," said the artist, "but who would we rent them to?" Lest the eagle eyes of The Outlook's proof-readers modify the foregoing sentence by adding an "m" to who, the editors of The Outlook wish to state that the artist did use the nominative form and, in the interests of that strict accuracy for which we hope we are famous, the "m" must remain mute. The artist of whom we are speaking generally, we believe, uses correct grammar, but we should recollect that his excitement at his friend's proposition was doubtless intense. This moot question being settled, let us return to the friend.

"I will," said the friend, with all the responsiveness of one of the chief participants in the story of cock-robin. "I will. Send me down that painting I looked at yesterday and I'll give you six per cent of your asking price for the privilege of hanging it on my walls for

a year. I'll insure it, and if I like it after living with it I may buy it when the year is through. Or I may rent another picture from you when the year is up. Whichever I do, you will be earning six per cent on your investment of brains, and that is more than some people get out of the stock market."

The idea seems to have possibilities. At the rate which this story suggests, a man might have a very well known picture in his house for a year for less than the upkeep cost of an automobile. He

might have an illustrious painting in his house for the week-end for a comparatively small sum. On such an occasion he might issue cards to his friends announcing that—

*Mr. John K. Jones
will receive at his home
on the
second Thursday in June*

and in the lower left-hand corner of these cards of invitation have inscribed—

To meet Sir Joshua Reynolds

Such an invitation would of course involve the co-operation of art dealers, who, we have noticed, are not averse to earning an honest penny. But perhaps the plan is most applicable to modern art. It would put the best of to-day's paintings in reach, at least, of the comfortably well-to-do, and the leaders in the second flight within the reach of almost any one who owns a Ford. As Henry knows, this would include a large majority of the population of the United States.

A CITY STREET

BY HARRY LEE

I
THAT there were trees
In Orchard Street,
Song birds upon the bough,
Blue violets among the grass,
Seems past believing now.

II
But even so in Orchard Street
They know that May has come—
By window-sill and crowded stoop
Bee-like, the voices hum.

V
And fluttering hosts of children there,
Fragile and pale and sweet—
Ah, beauty finds a fadeless May
In barren Orchard Street!

III
A flower wagon trundles by,
A hurdy-gurdy plays,
And beauty comes to spirits there
In many mystic ways.

IV
For there are dreams in Orchard Street
And cooling winds and rain—
And love and pity and the peace
That follows after pain.

A PILGRIM IN THE ANTHRACITE REGION

BY HARRY HIBSCHMAN, LL. D.

IT was the morning set for the beginning of the coal strike, and I was sharing a seat in the stuffy smoking-car with a salesman traveling for a shoe concern. As the train twisted around through the mountains, following an inky stream, with here and there a pond of black slime and everywhere huge banks of culm, he complained of the timidity of the merchants and the slimness of his orders; and, typical of his kind, he needed only a listener to swing into an airing of his views regarding the strike.

"See those black piles out there," he said, bitterly; "that stuff's been lying there for twenty years or more, but they are washing it over and mixing it with the good coal, so that for every ton of coal I buy in Philadelphia I get ten per cent of that dirt and slate. But what can you do about it? There's only one place to get hard coal, and you take what you can get and pay the price."

"Whom do the merchants sympathize

with? Why, the miners, of course. They know the truth about the business. They know what kind of life the miner leads; they know that he only works three or four days a week; they know that his wages are only a small part of the price of coal; and they know the operators. I haven't a customer who doesn't want the miners to win."

A few hours later I sat in a barber's chair. One question was enough to start him going.

"Do I know anything about the strike? Well, I guess, yes. My father-in-law's an engineer at one of the mines. He's worked there fifteen years; and I was raised right here myself. Say, man, I know this mix-up from the surface to the deepest workings. And the miners are getting all the dirt in the deal. The contractor makes good money sometimes, and when the bosses give out the figures it looks big. But they don't tell about the many who make much less.

And they don't tell about the danger, neither. For the contractor's work is robbin'—removin' the pillars; and, you take it from me, that's chancy work. He has to pay his helpers whether he makes it or not. He takes the risk and deserves to make something.

"How much? Oh, a laborer gets about four seventy-five a day underground and about four fifteen above ground. But they only average about four days a week. You can't bring up a family on that; and lots of them get along only because they have daughters in the factories. For instance, my wife's sister snakes home an average of eighteen dollars a week. Her folks don't need it like some of the rest, but many couldn't get along without it.

"More expensive to mine now! Who says so? Why, just think a moment. They used to run their cars with mule power, and one mule hauled at most two three-ton wagons. But now an electric motor pulls fifteen to eighteen

loaded cars or perhaps twenty-five empties; and just imagine how much faster they go! More expensive! That's sure the bunk."

I called on a banker next. After discussing other things, I asked, as if but casually interested, "By the way, what is the right or wrong of this strike?"

"The same story as everywhere else," he answered promptly and with the utmost assurance. "Labor, spoiled during the war, is trying to hold up the owners and the public, which always pays the bill."

"But what about the claim of forced idleness and consequent low yearly average?" I inquired.

"It isn't true here," was the answer. "During the last five or six years work in this section has been comparatively steady. The men have had about all the employment they wanted. You must bear in mind that they take many more holidays than most of us. They have all sorts of church holidays in addition to the others. For instance, they never work on Monday after Easter. And today they wouldn't have worked even if there had been no strike. They would have observed it as the day on which the eight-hour day went into effect in the mines. And so it goes. They have averaged at least five days a week in this district. That's five eight-hour days. Now they are asking five six-hour days for the whole industry at the same pay."

"As to what they are earning," he continued, "I'm in a position to know something about that. And I tell you they are doing well. If you doubt it, look around on the street to-morrow at church time, and you'll see the same clothes you would on Fifth Avenue or on Chestnut Street. The contract miner's checks are hardly ever under eighty dollars for two weeks, and they are often as high as a hundred and fifty. An outside laborer gets about five dollars. Underground he gets about six. And that's the minimum. Every one else gets from that on up; and seven and a half to ten dollars is more nearly right for loaders and others."

"The worst feature of the business is that the miners are insisting on dealing with the coal industry as a whole. Not only is there a great difference between the anthracite and the bituminous industries, but there are marked differences in different sections of the anthracite regions. These should be considered in fixing wages and conditions of work. It is not for the interest of the general consuming public to have the whole industry administered and regulated on one common basis. Under that system the public pays according to the cost of production in the poorer and more expensive mines and gets service according to the standard of the least efficient workmen."

"Another thing to be remembered is that it is as much to the benefit of the operators as it is to that of the men not

"SEE THOSE BLACK PILES OUT THERE! THEY ARE WASHING THAT STUFF OVER AND MIXING IT WITH GOOD COAL, SO THAT FOR EVERY TON OF COAL I BUY I GET TEN PER CENT OF THAT DIRT AND SLATE!"

to have the mines idle, for the pumps must be kept going just the same, and the workings must be kept cleared and in a condition of safety. About twenty tons of water must be handled for every ton of coal even when operating. That water is there just the same to be pumped on days when no coal is mined. All that goes into the price of coal. And the operators are not making an unreasonable profit."

From the bank I went to the office of one of the leading lawyers, making the excuse that I wanted to use his library, being myself a limb of the law. After I had been digging around a while, he sat down with me and of his own volition brought up the subject of the strike. When I quoted the banker, he laughed and commented:

"Well, we would hardly call him a disinterested witness, for he owns a lot of stock in one of the non-union districts of West Virginia. Still, there is much truth in what he said. The miners in this section have been making fairly good money and certainly do not need an increase. In fact, I am satisfied they don't expect it, and only asked for it to have something to dicker with. They would accept the old rate quickly enough."

"But it isn't simply a question of good wages according to the general standard. You've got to bear in mind that a miner's life is short. Have you ever had asthma? Well, no man can expect to work in the coal mines twenty years without suffering the tortures of the damned because of the black dust he has to breathe every minute he is on the job. And then there are many other dangers. Perhaps you noticed the cripple half lying on the sidewalk just above this building—a pitiful object, footless, with one hand gone, and half blind.

That's Exhibit No. 1. Walk down to the post office, and you will pass two more. They are victims of the mines, and the risk was their own. They received no compensation. As a lawyer I am rather calloused, I presume; but I tell you that I'm convinced that any man who takes the chances with his life and limbs that the coal miner does, certain at best to shorten his years to an appreciable extent, deserves the highest pay and, in addition, that the industry take care of him when he is no longer able to work."

"One thing that stands to the discredit of the operators, in my opinion," he continued, "is the fact that they shun publicity. If it is a fact, as they claim, that the price of coal is high because of the wages paid, why don't they produce the records? Living right here and engaged in the practice of my profession for many years, I have never seen positive evidence of whether they are making money or losing. But my guess is that they have made enormous profits. If not, why don't they let us see the books?"

On my way to the station I passed a bootblack stand and climbed into the chair. While I sat there some passer-by called the energetic shiner "Tony." So as I paid him, I asked, "What do you think about the strike, Tony?"

There was a twinkle in his eye as he answered, "One damn fina leetla Apreela Fool joke!"

I wot Tony was right. But the lawyer's words implied the real need of the occasion—it is, light in the dark places.

Unless coal property counts more than humanity, unless a part is mightier than the whole, unless the Government is impotent—let Congress get the facts, the truth, and then act.

TEN-HOUR DAYS FOR PLANTS

BY LEWIS EDWIN THEISS

A TROPICAL SORGHUM

Left to right, exposed to ten-hour day, thirteen-hour day, and full summer day length. Having always been accustomed to short days, this plant not only is prevented from flowering but even growth is greatly checked by the long summer day of our latitude. Note that this plant comes from a very hot region, hence it cannot be the excessive heat of our summer days which interferes with growth

WE have it on the best of authority that we are to know the truth and the truth is to set us free. But it is altogether probable that our idea of what that freedom means is as yet quite as nebulous as our knowledge of the truth itself. The fact is that only within a comparatively short time have we known much about the truth.

A little while ago Watt observed that steam had power to lift the lid of a teakettle, and as a result of his knowledge of the truth to-day we post o'er land and sea with the speed of the wind, in conveyances palatial. Some time later another observer noted the fact that gasoline under compression will explode; and as a result of that man's comprehension of the truth to-day we ramble the earth over in our comfortable motor cars and fly through the air like birds. Then some one else observed that sounds move through the air in waves; and because we knew the truth we are free to-day to talk to one another at great distances through empty space. Now comes another conception of truth; and as a result of that knowledge we are free to have the Christmas poinsettia on our tables in August, to adorn our living-rooms with iris blooms in mid-winter, and to have the finest of spinach in the dead of summer. Assuredly the truth is wonderful; but more wonderful still is the freedom that comes from it.

When we think of all the truth man has discovered concerning agriculture in the past half-century, it seems strange that not until now should he have learned that plants flower and fruit because they receive definite periods of light daily; and that when these periods of illumination are artificially manipulated we are free to have plants in blossom at practically any time we choose,

even though, as in the case of the iris blooming in winter, such a thing has never been known before.

We have long understood the truth that every effect must have a cause. And yet until W. W. Garner and H. A. Allard, physiologists of the United States Bureau of Plant Industry, recently began to search for the cause that produced the effect of flowering and fruition in plants we had absolutely no conception of the underlying reason for this reproductive miracle. As Topsy just "grewed," so, in the minds of most of us, this just "happened."

The investigations of these men and their co-workers grew out of their observation that, outside of the tropics, different plants almost invariably flower and fruit only at certain definite seasons of the year. Thus the arbutus blooms in early spring, as do the service-berry, the adder's-tongue, and a thousand other familiar plants, and almost invariably they bloom only in the spring. Comes summer, and with it blow the daisy, the Oswego tea, the day lilies, zinnias, and others. With autumn we find the asters abloom and chrysanthemums and altheas and witch-hazel. And since time began, so far as we know, these plants have always flowered in this order. But why they always flowered in this order we never even guessed until Messrs. Garner and Allard began to probe into the cause.

There are many plants, like our common annuals, that grow for a season and die, root, stock, and branch. Only if they mature seed can these species avoid extermination. It is a natural conclusion, therefore, that the entire activities of such a plant are directed toward this means of propagation, all other growths being but secondary to this means of

propagation. These scientists tell us that this is not so. They tell us that plants merely inherit the capacity to flower and fruit in response to given conditions. And they tell us further that, lacking these conditions, there can be no flowering or fruiting, even though growth should continue indefinitely.

Temperature is not, as most of us would instantly assume, the ruling factor. To be sure, there must be a certain amount of heat before there can be any growth at all; and of course there is a degree of heat beyond which plant life cannot exist. But, aside from these limitations, the matter of heat seems to play little part in plant growth and reproduction. This is shown by the fact that, even when appropriate temperatures are provided out of season, as a rule flowers and fruit fail to appear except in their regular period.

The common iris, which ordinarily flowers in May and June, will not bloom in winter in the greenhouse, even when the temperature of May and June is duplicated. Again, some plants that normally bloom in the cool of autumn will also bloom in the hothouse in winter, showing that the cool fall weather has nothing to do with the matter of flowering. Such a plant is the cosmos. But behold! if plantings are made after a certain date, though the temperature be even the year round, the plants so started will not bloom, but will continue to grow without blossoms until the following fall, the normal season for the cosmos to bloom, meantime reaching gigantic size. Then flowers will appear. So it is evident that some cause other than temperature is responsible for the flowering of plants.

In some way, it is clear, the time of flowering and fruiting in many plants is inseparably linked with the advance of the seasons. The matter of heat eliminated, there remains but one other factor that changes regularly with the advance of the seasons. That is the matter of the daily period of light. In the latitude of New York, for instance, the short days of the year are about nine hours in length. The longest days exceed fifteen hours. Year after year this change occurs with mathematical precision. December 21 is always a day about nine hours long. June 21 invariably has something more than fifteen hours of natural illumination. And any given date between these days always has a given amount of daylight, year after year. On a given day it is ten hours. Another given day has eleven hours. A third date has twelve hours of darkness and twelve hours of light. So it goes, year after year.

To see whether or not this varying length of daylight really plays any part in the flowering and fruition of plants, these scientists of the Bureau of Plant

MARYLAND MAMMOTH TOBACCO DOES NOT FLOWER IN OUR LATITUDE DURING THE OPEN GROWING SEASON BECAUSE THE DAYS ARE TOO LONG

MARYLAND MAMMOTH TOBACCO FLOWERS READILY IN SUMMER IF THE DAY IS SHORTENED TO TWELVE HOURS

Industry had "dark houses" made, which would admit air freely but no light. By growing plants in containers on easily moved trucks, it was possible to shift them into and out of the dark house at will, thus regulating the number of hours of daylight received by any given plant. By growing duplicate plantings in permanent outdoor beds, it was easy to see how the dark-house plants grew in comparison with those growing under normal conditions.

The soy bean gave a very striking reaction. The variety Peking, for instance, required sixty-two days to reach the blossoming stage when grown normally in the open. But the plants that spent part of each day in the dark, getting but seven hours of daylight out of each twenty-four, flowered in twenty-one days. A common wild aster, which ordinarily flowers in September, behaved in the same way. Grown normally, it required 122 days to blossom. Given but seven hours of light daily, it flowered in 36 days. So it was discovered that these plants make their flowers and form their fruits at given times of the year because of the daylight period that goes with those dates. Approximate that period of daily illumination, and the plants will make haste to bloom.

So were produced the matured Christmas poinsettias in August. The daily light period was decreased until it approximated that of the Christmas season, and behold! the poinsettia matured its brilliant red bracts. So with the chrysanthemum, the flower of fall. When the daily light period was reduced to the length of the autumn days, behold! the chrysanthemum hastened to bloom.

So it goes with many, many plants that bloom in the short days of the year. Give them a day artificially shortened, and promptly their energies are turned toward reproduction. Necessarily of course the shortening of their growing period tends to reduce their purely vegetative processes and results in lessened growth.

But what about the flowers, like the

iris, that normally bloom when the days are longest? Reducing the daylight period could not and did not throw them into bloom. But lengthening the daily period of illumination during the short days of winter did!

Now, there are many flowers that we grow out of doors in summer and in the hothouse in winter. But the iris has never been one of them. Put it in the hothouse and exactly duplicate the temperature of June, and the iris remains only a dormant plant of sword-like leaves. But put it in the hothouse in winter and lengthen the daily period of illumination to correspond to the days of June, and lo! the iris comes to life, shoots up a flower stem, and blooms. That is what Mr. Garner and Mr. Allard did. They put iris plants in an unlighted hothouse with the temperature of summer, and they had iris plants all winter—and nothing more. But when they put other iris plants in another hothouse with a similar temperature, but with more light, they soon had flowers as well as plants.

To be sure, they had no light as powerful as the sun to turn on. In fact, they had only relatively weak electric lights to turn on. These were strung overhead, and the degree of illumination was only three to five candle-power at the surface of the soil, whereas winter daylight may reach the intensity of 5,000 candle-power or more. And yet

this insignificant light was sufficient to stir the iris plants to life. The lights burned from sunset to midnight each day.

So it was discovered that plants may be roughly grouped in two classes, short-day plants and long-day plants, with a great host of intermediates, which seem capable of blooming under quite widely varying conditions.

This is the truth. But what of the freedom that is to result from it? Who can say? When Marconi succeeded in flashing his first message across the English Channel, who could foresee the 600,000 wireless telephones of to-day and the millions of to-morrow? Who ever dreamed of the nightly clatter in the air—concert and lecture and speech and opera—that now fills the nocturnal ether?

When Watt perfected the steam-engine, who ever conceived, even faintly, the incredibly vast uses of his invention—the rushing ocean liner, the roaring express train, the huge and endless factories, all built on a steam-puffed kettle cover?

And now that we know, even so faintly, the truth about the flowering and fruition of plants, who shall say what freedom may not come of it? One thing is certain: It means a new race of plants. It means that products the world has never seen before will shortly come into being. Florists and horticulturists and agriculturists will now be able to hybridize plants that could never be crossed before because they did not bloom at the same time. Now they can be made to bloom together. New crosses of all sorts will now be possible. And just as in 1922 we have the radio telephone that was not even dreamed of in 1900, so a quarter, a half of a century hence we shall have plants we now know not of, and we shall have a new agriculture based upon these plants and upon the findings that investigators will make concerning our common farm crops. Wonderful, indeed, is the freedom, the enlarged life, that is born of truth.

DO you know that you are a stockholder in a corporation that is losing \$50,000,000 a year? Newton Fuessle has interviewed its chief executive for The Outlook. The business he manages is your business. Naturally you will read Mr. Fuessle's forthcoming article with interest—self-interest.

INTERCOLLEGIATE ATHLETICS

THE UNDERGRADUATE TAKES A HAND IN THE DISCUSSION

CONCERNING the question of intercollegiate athletics there has been much talk. College presidents, educators, athletic directors, and sport writers have all had their say on this mooted subject. So far as *The Outlook* has been able to observe, very little attention has been paid to the opinions of those most concerned in the success or failure of intercollegiate athletics—the undergraduates themselves.

That is why *The Outlook* offered ten prizes for the best discussions of this problem, and limited its contest to undergraduates of American colleges. Our hopes of securing valuable and representative opinions through the medium of

this contest have been more than justified. We think those who read the first, second, and third prize letters, which we published in last week's issue of *The Outlook*, as well as those who read the Fourth Prize letters, published in this issue, will entirely agree with us. We expect to publish still another installment of these representative letters in an early issue of *The Outlook*.

We wish that our public men could always keep their feet as firmly on the ground of common-sense idealism as have the majority of the undergraduates who entered our athletic letter contest.—THE EDITORS.

A LETTER WHICH BONED MUCH BOOTLICK WITH THE OUTLOOK

"Oh, optimism, thy name is Outlook." Doubtless you will reap a voluminous harvest of undergraduate opinion when you seek it upon such a vital subject as sport, but the mere idea of expecting any two undergraduates to agree upon any one subject argues forgetfulness of the editorial college days.

However, most of us can get together on a few broad generalities, such as the following: Athletics means football, undergraduate opinion means that of "my own little circle," and general college opinion is that of "my Alma Mater," which is different from (and therefore superior to) all others in existence.

Now, flaunting these definitions, let me leap down into the arena of undergraduate opinion and add my bit to the turmoil therein.

First, I'm a West Pointer (and prouder of that title than I'll ever be of any other). Now here at the Point we have universal compulsory athletics, and every cadet plays baseball, basketball, lacrosse, soccer, tennis, polo, and hockey, and of course, football, some time during his career. Since I have seen it in operation I do not hesitate to claim that the place of athletics is that of a compulsory subject in the curriculum, and inferior to no other subject, because it breeds the good health which is the prerequisite of all successful study.

When all men engage in a sport, we find that the competition for the varsity is keener, and so the emphasis placed upon the sport as such is redoubled. If this emphasis is properly handled, it can do no harm, for strict scholastic requirements keep the academic work from deteriorating. West Point goes crazy over football, but she doesn't sacrifice her academic standing upon its shrine. Her enthusiasm is shown by the fact that the best students in each class are "turned out" by their classmates and often sit up half the night frantically coaching the men on the football team

during our justly famous (or infamous) examinations.

What are all these men after? Victory? Yes, but only if fairly won. We believe in our motto: "Back the team—play to win—but play fair." Undue emphasis upon victory as such means only one thing: the ultimate justification of cheating. We don't believe in that, and it can only present a problem where there is a fundamental defect in the spirit of the entire school. Army-Navy Games are fought to the limit, and a Navy victory puts all West Point in mourning; but we'd rather mourn such a glorious defeat as that of last November than to celebrate a victory won by unfair means.

This spirit of fair play, which every school should have, bars all athletic scholarships and professionalism. It should forbid proselyting (except in actual cases of honest transfer, which can be judged by a lively school conscience). The school conscience should be double-action, but often isn't—that is, it should as quickly criticize "our team" for cheating as it does that of the enemy.

Finally, we admit that the part of the undergraduates *en masse* regarding the coaching of the team, the formation of its schedule, or the eligibility of its members should be limited to standing around and fiercely criticising the men who are responsible. This is a favorite amusement of all undergraduates and does no harm to any one. It also keeps them out of mischief. By all means let it continue. "The team, like the size of the Army, is the business of all citizens, and they should be permitted to attend to it just as long as they limit their attention to talking and do not get in the way of the busy men who are responsible for these things.

Sport writers we condemn impartially, because they always misspell the name of our particular All-American candidate, but we continue to mob the newsstand on the morning after every game.

So now I'll emerge from the arena, still shouting and unconverted, and firm in the conviction that we want sport, that we need sport, and more sport and clean sport as well, and that Army can

whip Yale, Notre Dame, and Navy—especially Navy—any time the luck breaks even.

A SIMPLE AND EFFECTIVE SYSTEM

AT M. I. T. we have a system of athletics run by the students and for the students. There is little, if any, outside control, and no possible taint of professionalism. As a result the grade of sportsmanship is unusually high and the benefits widely distributed. Because I believe our system could be adopted by other large colleges for the best interests of college athletics, I will set forth some of the fundamental ideas which govern it.

"A sound mind in a sound body" might well be our motto. We believe that scholarship should not suffer, but rather benefit, from athletics. The Faculty does not strew the path of the athletic star with roses. He must show his right to competition by first passing all his subjects. It has been demonstrated that the scholastic standing of team men is above the average of the school. So much for the sound mind.

The sound body is attained by a constant policy of giving the most exercise to the most men. We view our teams from three angles. Primarily, they must encourage and furnish exercise to as many students as desire it. Secondly, they must be successful in showing that Tech men are real fellows with the highest grade of sportsmanship. Thirdly, they must add to our prestige through being as successful as possible.

The entire direction of athletics is intrusted to a student association. There are junior managers and team captains

¹The modest author of this letter has chosen as a pen name a word which, in the slang of the Point, is a synonym for a fourth classman or for anything the name of which is unimportant or momentarily forgotten. We may add that we have used as the title of his prize winning effort a phrase stolen from his letter thanking us for our check. We trust that we have used the phrase "cold."—The Editors.

who comprise the Association. The officers are elected from the juniors of the previous year. The continuity is maintained by an Advisory Council of alumni, all former athletes of Tech, who act in a purely advisory capacity and receive no compensation. Contrary to most large universities, there is no graduate manager or paid coaches whose jobs are dependent upon winning teams, and who influence the athletic policy of the school teams.

Athletics are financed through a student tax of \$2.50 per man. This is very low as compared with other colleges. A revenue of less than \$8,000 is thus obtained on which to run fourteen varsity teams in addition to the twenty class teams. As payment of the tax entitles a student to free admission at all contests, gate receipts are small. We do not handle the spectacular varsity football and baseball teams which are usually able to attract enough gate receipts to maintain all the other sports. Although we only had \$8,000, we were able to handle 1,671 men who came out for teams and to finance 189 meets. As a result we have necessarily attained a high standard of efficiency in management. That is best illustrated by the annual cost per man carried on the squad—track, \$7; crew, \$8.25—and the fact that 1,671 men tried out for teams. That is a record in economy and efficiency which is unparalleled.

There are no hired managers, no hired athletes getting as much as an athletic scholarship, and only one coach who has a steady job as physical director. There is no possible chance for commercialism, and, on the other hand, we as under-

graduates benefit from the experience of guiding our own affairs. We come out with a greater pride in our college, a greater confidence in ourselves, a knowledge that we have played the game for the game's sake only, and withal we turn out teams as successful as the next college.

All this I believe might be attained by other colleges through scrapping their highly paid and artificial system of graduate managers, salaried coaches, and endowed athletes. Make athletics an undergraduate affair for the benefit of undergraduates, and not an expensive system of spectacular entertainment for the jaded public.

GIVE COLLEGE GIRLS A SHOW

SINCE I am a girl, a freshman at that, and just eighteen, you may think I have no business to write about college athletics at all; but I am interested in women's college athletics and anxious to see them encouraged. The head of the department of physical culture for women would say that we have a perfected system here. "Why," she would tell you, "our women have a chance to win their 'M's' as well as the men." That is all very well, but the fact remains that, while there are practically as many women as men at Minnesota, over fifty men have been awarded the coveted M this year and only one woman. The reason for this is evident.

Athletics are not made sufficiently attractive to women in colleges to make it worth their while to compete. In the first place, age-old prejudice exists in regard to women being indecently clothed while exercising. Girls' clothes hinder athletic activity. Women are not permitted to participate in athletic events unless they wear full, baggy bloomers which have a binding rubber just above the knee. I remember my own chagrin when I lost a high jump because my bloomers touched the rope. What man athlete would tolerate such a hindrance while he was running or pole vaulting? Women must also wear long stockings, which hinder free movement of the knee. No one ever heard of an international record being broken by any one wearing long stockings. There is also a lack of money for sports among the girls. While many thousands of dollars are spent to finance football, basket-ball, and swimming teams for games with other schools each year for the men, no money at all is expended to take women's athletic teams on similar trips, although we have the teams and would like to go.

From all over the world comes the cry for women's rights, and with such rights comes the obligation of women to be physically strong and clear-headed. Nothing will aid this more than improved and encouraged athletics for college women. Please give the girls a show in college athletics. All we need is encouragement, money, and a revision of public opinion regarding correct athletic clothes.

ANN COE,
University of Minnesota, Class of 1925.

A later issue will contain other prize-winning letters from undergraduates on the subject of college athletics.

THE OLD PEARL NECKLACE

BY MARY VALENTINE STANLEY

JOSEPH, the Princess A. has a pearl necklace to sell."

Joseph Wise was playing Schumann, and did not hear. He was an American Jew of fifty. He had a benevolent face, a bald head, and dreamy eyes. His young wife, Madeline, was also an American, but not of his faith. They had been married a year, and were spending a month of their prolonged honeymoon in Vienna.

"Joseph," repeated Madeline, "the Princess A. has a pearl necklace to sell. She has asked me to call this afternoon to see it."

"Where does she live?"

"In the L— Palace, in the S— Gasse."

"I should like to see that palace. I hear it is eight hundred years old."

"Good. You shall see the palace, Joseph, and incidentally I may pick up a jewel or two. Let us go now."

Joseph rose obediently and put on his coat. Madeline pulled a turquoise velvet hat over her brown curls and

wrapped herself in a seal coat with a sable collar.

"I learned from Levi yesterday that this coat belonged to the Duchess L. As she was quite a dowd, it looks far better on me."

Joseph looked into the fresh young face and smiled.

"You are beautiful, my dear. I like to see you in this coat, but I hope the Duchess is not cold."

"The aristocrats were a soft lot, Joseph. It will not hurt them to know poverty. I suffered hardships, and worked early and late until I met you, dear old boy!" She bent her soft cheek to his. "Now it is my turn to enjoy the flesh-pots of Egypt."

Arm in arm they walked through the gardens of the Belvedere. For a moment they paused in front of the palace where the ill-fated Sophie and Ferdinand had lived and gone out to die. Through the glass doors they caught a glimpse of the great marble hall and stairways with their statues and priceless tapestries.

Hundreds of children, undersized, with faces prematurely old, many scantily clad, were passing through the iron gates and climbing the hill to the palace.

"These youngsters are fed here every day by the Americans, Madeline. See the Stars and Stripes waving over the doors of the royal kitchen."

"It is the American money that is keeping Austria alive," she replied, "and to-day there are seven hundred and twenty kronen to the good old American dollar. I have already cashed five hundred dollars," added Madeline, gleefully. "Let's run along, Joseph. It's four o'clock; we dine at eight and we play bridge with the Levis at half-past nine."

They walked rapidly through the gardens, and came out on the Rennweg.

A young girl with a sack of coal on her back trudged wearily by. Women harnessed to carts patiently dragged their heavy loads. A one-legged soldier crouched on the pavement. About his

neck hung a card on which was written: "*Bitte, Ich bin ein blinder Mann.*"

"He fought for his country, poor lad, and now he has no country to mother him," said Joseph, sadly. "Look, Madeline."

"Yes, I see, Joseph, but you gave thousands of kronen for the soldiers' fund this morning. Let us forget them for a little while, and talk of something cheerful. Pearl necklaces, for instance. All my life I have longed for pearls. Many times I have gone window shopping on Fifth Avenue. One Saturday afternoon (I was working for fifteen dollars a week then) I went from shop to shop, trying on necklaces just for fun. You say yourself that my neck was made for pearls."

"Well, my child, buy your little baubles, if you care for them."

They walked in silence for a time, Madeline in joyous anticipation of seeing the jewels on her white throat, and Joseph quietly content in her happiness.

When they crossed the courtyard of the Hofburg, Joseph's eyes kindled.

He recalled to Madeline the memory of the time when, as a boy of fifteen, he had come to Vienna with his father, who had presented a petition from the Jews to Francis Joseph.

"It was in this palace, Madeline, that we were most graciously received by his Majesty; and the petition did much good to my people."

His wife smiled and nodded. He did not know that his words had fallen on deaf ears.

When they reached their destination, Joseph lingered to look at the lions that guarded the door of the palace.

"You could tell some interesting tales, you old fellows," he said: "you saw—"

"I'm glad they can't talk," interrupted Madeline, good-naturedly.

The porter, a withered, pallid old man, opened the door with a faint "Kiss thy hand." He led them through the great stone corridor, and up the steps to the apartment of the Princess. A butler, equally old and pallid, in a gorgeous livery with silver buttons, ushered them into the *salon*.

The Princess was short and fragile, but carried herself with dignity.

Her white hair was piled high on her small head. Her face, worn by sorrow, was still lovely in its delicate beauty.

Like all educated Viennese, she spoke English fluently.

She had never been to America, she said, but she had many American friends. She had frequently entertained Mark Twain and his sweet wife while they were living in Vienna. She had known Bret Harte, William Dean Howells, and many others.

Joseph was keenly interested in her reminiscences, but Madeline was restless. That the great of many landstatesmen, authors, artists—had been entertained in that stately *salon* by the Princess was nothing to the young American. She had only a vision of herself wearing the pearls.

"Princess," she said, abruptly, "may I see the necklace?"

The Princess came back to the present with a start, but did not answer.

"It is quite cold here," she said, hastily. She touched the bell, and the butler entered with a tray of tea.

He put a shovel of coal in the big white-and-gold stove, and stole noiselessly out. The princess followed him with her eyes.

"Dietrich was five years old when I was born," she said. "We were born in this palace, both of us, and all these years he has served me faithfully. My younger servants I have had to dismiss, but my old servants I hope to keep with me to the end."

Her voice faltered, but in an instant she smiled, saying gayly, as she poured the tea:

"You must drink my famous tea. This was given me by the Emperor of Japan, and I have enough for a lifetime."

"Delicious," said Madeline. "I wish that I knew the Emperor."

The old Vienna china with its rose-buds, the squat tea service and long spoons worn thin by age, the Princess with her high-bred face and sensitive hands, made a never-to-be-forgotten picture in the eyes of Joseph Wise.

Madeline cleared her throat for another effort. "Princess, it was very kind of you to give us a chance to see your pearls."

The Princess bowed her head and drew a jewel-case from her hand-bag.

Madeline's eyes glistened, she leaned forward eagerly.

The Princess held the case in her hands unopened.

"These pearls were given me by my great-great-grandmother, the Princess of A." She pointed to five miniatures that stood in a row on the old Viennese table. "See, for five generations we have been painted in these pearls."

Joseph rose and studied the miniatures.

"I have made quite a collection of miniatures," he said, "but these are exceptional."

"Though the pearls are very old," continued the Princess, "they have not been allowed to die hidden in jewel-boxes. They have been kept alive and beautiful by almost constant wearing. Ever since they came into our possession twice each year they have been dipped in sea water."

She opened the box, and, taking out the precious treasures, wound them four times around her slender neck. They were exquisite in color and perfectly matched.

"When Napoleon Bonaparte was in Vienna, Madame, my grandmother, was presented to him. She wore these pearls. Napoleon wished them for Josephine. At the coronation of Queen Victoria my—"

But she was not allowed to finish her proud story. Madeline could no longer control her impatience.

"Princess, how much are you asking for the necklace?"

"Hermann, the expert, priced them at two million kronen."

"Thank you. May I look at them closely?"

Reluctantly the Princess placed them in her hand. Madeline walked to the pier-glass and wound them around her lovely neck. Her eyes sparkled. For some moments she stood silent, smiling at her reflection in the mirror.

Joseph had picked up an illuminated copy of the Book of Job, and seemed to have forgotten everything but the exquisite beauty of the old pages.

The Princess sat quite still, her hands crossed in her lap.

Presently Madeline turned from the smiling face in the glass, and said, coldly:

"The price set for the pearls is absurd."

"Absurd!" cried the Princess. "The necklace is famous, not only for the perfection of the pearls, but because of its historic interest."

"Its history does not interest me, Princess. If they had been worn by all the queens in all the Courts of Europe, it would not enhance their value in my eyes."

The Princess shivered, her eyes filled with tears.

"You have other jewels?" asked Madeline.

"I had others, but nearly all of them were sacrificed during the second year of the war. I gave the money to my sister, the Duchess of L. My diamonds are in Paris, but the market is glutted. The windows are ablaze with jewels that once belonged to the aristocrats of Russia, who have literally poured their treasures into the lap of Paris."

"True," Madeline smiled slightly, "the markets everywhere are glutted. You can't expect to receive normal prices. I will give you one million five hundred thousand kronen for the pearls."

The Princess raised her eyes half proudly, half appealingly.

"I have gladly sold my jewels to help others; but the pearls are so precious, if I must part with them, do not ask me to do so at a sacrifice."

There was no response. The Princess glanced at Joseph. His face was bent low over the book.

The tall clock struck six.

"We must be going," said Madeline, briskly. "Shall I have my husband draw a check for one million five hundred thousand kronen? I assure you, Princess, you can do no better."

"One million five hundred thousand kronen is only about two thousand dollars in your American money," cried the Princess bitterly, "and my need is great."

For a moment they looked at each other, the *nouveau pauvre* and the *nouveau riche*. Madeline, still wearing the pearls, looked down on the little Princess from her superior height and waited.

A vision of what the morning would bring without money swept over the

Princess—immediate need forced her to yield.

She bowed her head.

"You may have the pearls for one million five hundred thousand kronen," she whispered so low that Madeline was forced to bend her head to catch the words.

"Joseph, Joseph!"

"Yes, Madeline."

"Please draw a check for one million five hundred thousand kronen."

Slowly adjusting his glasses, Joseph drew his bank book from his pocket and wrote the check.

"Good-by, Princess." Madeline was

all smiles and graciousness as she took the cold hand of the Princess in hers. "Let me know if you do not sell your diamonds in Paris. Ah, the jewel-case—I will take that too, please, but I will wear the necklace home."

She beamed on the butler, and put twenty kronen in his hand as she swept through the door into the hall.

Joseph bowed low as he slipped the check into the hand of the Princess.

"Don't discuss Job, please, Joseph. I know that is what you would like to do, but it is getting late," said the gay voice from the doorway.

"Coming, Madeline."

The Princess glanced at the check through her tears. Then she lifted her eyes to the man without a word, but he read in them her unspoken joy and gratitude. Joseph Wise, the Jew, had drawn his check for *two million kronen*.

When they reached the street, Madeline fairly bubbled over with joy.

"Joseph," she said, confidentially, "I shall tell all my friends that the necklace is valued at two million kronen, and—"

"Tell your friends," said Joseph, with a look the woman never forgot, "that your husband gladly paid the full value of the famous pearl necklace."

MISSISSIPPI'S GREAT FIGHT FOR HONOR AND PROSPERITY

BY FREDERICK W. JONES

ALL of the foreign fire insurance companies doing business in Mississippi have withdrawn.

At the time of their leaving there was only one home fire company, and that a small one. Ever since property has been without adequate protection. Many industries, such as cotton-oil mills, that have been destroyed by fire have not been rebuilt. The credit that is based upon sound fire insurance has been shaken, and a long trail of economic and social ills has followed. The Governor has made the charge that the fire insurance companies, in revenge for legal prosecution undertaken by the State Revenue Agent, Stokes V. Robertson, which led to their withdrawal, instigated a seduction suit against him that has created a scandal throughout Mississippi. An investigation of the Governor's charges has recently been made by a committee of the House of Representatives, which reports that it can find no evidence to support such charges. And while all this is going on the people of the State are rapidly dividing into two great camps in preparation for a social, economic, educational, political, and, eventually, religious battle that will probably continue for years. At any rate, this battle from now on will be carried into every important contest before the people until it is settled. These, in brief, are the events that led up to the present unhappy situation:

Over a year ago the Revenue Agent brought suit against the fire insurance companies, among them most of the largest and most influential in this country and abroad, for \$400,000,000 of punitive damages. He charged them with violating the anti-trust laws through the use of the rates advised by the Mississippi Rating Company of Vicksburg, thus conspiring to fix rates and destroy competition. The maximum penalty established by law is

Brown Bros.

LEE M. RUSSELL, GOVERNOR OF MISSISSIPPI

\$5,000 per day. As the alleged offenses covered a period of several (about fifteen) years, the total damages demanded were sufficient to wipe out the capital and assets of a great many of even these powerful companies in case the suit of the State were successful. Soon after the suit was filed the Revenue Agent garnisheed all the funds due or to become due the companies in Mississippi, amounting to about \$1,000,000. At about that time the companies let it be known that they would have to stop writing business. The Revenue Agent maintained that such action

simultaneously taken amounted to another conspiracy, and he succeeded in obtaining from the courts an injunction against such alleged conspiracy. The companies, however, were forced to refrain from writing business, and when, on March 1, the time for the renewal of their licenses for the next business year arrived, their right to operate in the State expired by default.

In the trial which followed, the Insurance Commissioner, T. M. Henry, who has held his office for many years and enjoys a high reputation for ability and integrity among insurance commissioners throughout the country, showed that he regarded the action of the Revenue Agent as an outrageous attack upon the companies and a terrible blow to the good name and the prosperity of the State. He testified that fire insurance could not safely be written without the use of such a service as was provided by the Mississippi Rating Company, a corporation chartered by the State to perform the very service for the use of which the companies were sued for four hundred million dollars. The business, he said, could not survive without expert inspection and classification. No one company could maintain such an expensive service and sell insurance at a rate within the reach of property-owners. Through a service that was used by all the companies the expense could be so distributed that no policyholder would feel it. Moreover, the Commissioner stated, uniform rates were universal, in line with sound public policy, and were essential to safeguard solvency of the insurers.

In the trial the attorney for the companies established the fact that his clients were afraid of the attitude of the State toward foreign capital and refused to subscribe to or make use of the Rating Company without an opinion from the Attorney-General. It was only upon

Wide World Photos

THE STATE CAPITOL AT JACKSON, MISSISSIPPI

This imposing building was constructed from funds accruing from railway damages

his assurance that such use would be legal that they made use of this service. It was also asserted both by the attorneys for the defense and the Insurance Commissioner that the companies have made little or no profit in the State since they entered it.

A powerful effort on the part of business men and the insurance agents, supported by a large part of the press in the cities, was made to persuade the Governor to call a special session of the Legislature to abate the suit. The Governor responded in a public statement bitterly attacking the companies. The suit in the lower court resulted in a judgment calling for damages of over a million dollars.

Since then a public prosecuting official in one of the counties has brought suit against all the foreign life insurance companies for enormous damages. The charges were almost exactly similar even in phraseology to the Revenue Agent's suit against the fire companies—conspiracy to fix rates and destroy competition by the use of the American Experience Table of Mortality.

The Legislature was in session when this suit was filed, and a law was passed, but not without serious opposition on the part of the administration, abating the suit. A bill was also passed by the House and Senate making legal such service as the Mississippi Rating Company, but the Governor refused to sign it on the ground that it would be equivalent to sanctioning the acts of the "outlawed" companies, as he calls them.

The chief contest in the Legislature which recently adjourned developed over the question of putting the Revenue Agent upon a salary. He now receives a commission of twenty per cent of all the damages he can collect. His office has brought riches to its occupants.

Wirt Adams, who died in the office, left a very large estate. Under his administration the present imposing State Capitol at Jackson was built with the funds accruing from railway damages. In this connection, it might be added that the State recently has been suing several railways for enormous damages. As has happened in so many cases of this kind, the suit resulted in a compromise involving a judgment for a small fraction of the amount the State originally demanded.

The forces that are eager to encourage foreign capital to remain in the State and new capital to enter maintain that if the Revenue Agent were on a salary basis the world would hear no more of the withdrawal of corporations. The forces supporting the Revenue Agent maintain that these corporations are "trusts" and "tax dodgers" and that the vast sums that are being collected from them are helping the poor farmers who are now carrying a heavier burden of taxation than they can long endure. This bitterly contested piece of legislation was vetoed by Governor Russell. In giving his reason for the action he made a prediction that far-seeing men and women of Mississippi thoroughly believe will come true. He said that the issue raised by the suit against fire insurance companies will be the issue upon which all great questions will be tried from now on until it is settled.

The Governor, the Revenue Agent, ex-Senator Vardaman, and their friends maintain that "the trusts" are threatening the sovereignty of the State, attempting to dictate to the Legislature and the courts. Their opponents assert that the men who are fighting outside capital are actuated by selfish motives. The commissions are unduly attractive, and as such dangerous in perversion

possibilities, they declare, and the demagogic resort of stirring up among the poor and ignorant a hatred of organized wealth is injuring the good name of the State, crippling her finances, and putting evil men in her high offices. Mississippi is one of two States that are losing in population. There has been a vast exodus of Negro labor; the capital necessary for its employment has been withheld. This is the line of cleavage.

A brief analysis of the coming battleground cannot but be interesting to the student of American economic and political life. Mississippi was once led by some of the greatest statesmen of the Nation. Such names as Davis, Lamar, Prentiss, and George are proof of that statement. Nor has her glory quite yet departed. John Sharp Williams is in the front rank of scholarly statesmen, and Senator Harrison has gifts of political analysis and attack. But this is all that for the moment remains of her greatness, and that is established at Washington.

Since Vardaman came into power upon the back of the Negro the demagogue has been all-powerful in State politics. In his day it was the promise of the repeal of the Fourteenth Amendment that won the support of the trustful small farmer. To-day it is the cry that "the trusts shall not pass," as Governor Russell puts it, that is holding him in line. But there are signs of such an intense campaign of education in the rural districts that this all-powerful voter may soon waver in his allegiance.

The "hill" farmers for years have carried every election by a huge majority. They read but little, chiefly the county weeklies, which are supported by the county advertising supplied by the supervisors, who, for the most part, are

loyal to the Vardaman-Russell-Robertson combination of corporation hunters. These newspapers contain the most extreme attacks upon the "outlaw" fire insurance companies and the most extravagant praise of the Revenue Agent. The larger dailies of the cities within the State and from the big cities outside the State, which are boldly or quietly opposed to the attitude of the State toward corporations, circulate but little among the outlying farms of the hills.

But powerful forces are rapidly organizing to reach this region. Neglect of it by the leaders of enlightenment and righteousness has allowed ignorance and intolerance to govern the State for many years in the person of the demagogue. The wide insistence upon better education of the masses has resulted in the last few years in the establishment of many consolidated high schools and agricultural schools that have already stopped the progress of the demagogue. In the last Legislature each day saw an increasing weakness on the part of the formerly all-powerful faction that represented the narrow-mindedness and class hatred of the misguided and demagogue-ridden small farmer. Even "Vardaman's Weekly," which has a wide circulation among the hills and reads like the address of some radical agitator in

London's Hyde Park, is not everywhere regarded as sound economic and political gospel.

Some of the most patriotic and forward-looking Mississippians are setting aside many of their regular duties to devote their attention to offsetting the evils that have sprung from these years of demagoguery. Ex-Governor Charles H. Brough, of Arkansas, a native of Mississippi and a graduate of Mississippi College, has been going up and down the State pleading with the people to change their laws and their attitude toward capital. Mr. Barney E. Eaton of Gulfport, George R. James of Memphis, and J. T. Thomas of Grenada are also trying to guide the citizens from the public stump, pointing the way to sound farming and business principles. But the man who is doing the most for the future of Mississippi to-day is, in my opinion, C. H. Markham, the remarkable President of the Illinois Central Railroad, which operates extensively in this State. His company maintains "Demonstration Farms" throughout the State. His agricultural experts lecture and display moving picture reels in the schoolhouses along the I. C. and the Y. & M. V. Railroads. "Diversify; live at home; use well-bred stock; produce and drink milk; improve your poultry." That's his message. In public speeches, in paid advertisements, and in

multitudes of personal letters he has reached almost every district and corner of Mississippi. His frankness and his fearlessness have won thousands of small farmers to a belief in him and his road as agents of public service. More men of this type, and Mississippi would meet the Vardaman issue, soon to absorb the attention of the State, with perfect confidence—the former Senator's return to Washington would be forever barred. In a recent letter to the writer President Markham said:

"The ease with which demagogues sometimes succeed in misleading the people is enough to shake one's belief in the virtue of democracy, but my faith in democracy has come through all such tests thus far unshaken; I believe in the ultimate triumph of justice wrought by public opinion, when the public has all the facts and is given opportunity to pass sane judgment upon any issue. But we cannot desert the field and turn it over to the enemies of progress. The cause of righteousness demands fighters."

To many of us lovers of this misguided State of sweet and glorious memories who are fighting this battle from the stump, the press, and the pulpit, it is inspiring to think that such men as President Markham are enlisted in the cause, and we await with confidence the issue of the conflict.

CLEAN MILK FOR THE METROPOLIS

BY SHERMAN ROGERS

INDUSTRIAL CORRESPONDENT OF THE OUTLOOK

ICY blasts swept Manhattan from the Battery to the Bronx. Surface-car traffic was entirely suspended. Broadway was practically devoid of vehicular traffic. Great drifts of snow covered every thoroughfare in the city. A great majority of streets were absolutely impassable.

We prepared our breakfast in our upper Manhattan apartment. A terrific wind rattled every window in the apartment like something "possessed." The thermometer registered below zero. The lady across the hall, her fingers blue with cold, assured us it was the worst ever in the seventeen years she had lived in New York City. Newspapers were not delivered that morning—but, to our intense surprise, *milk bottles were*. We were at the end of a milk route; our milk generally reached us about seven o'clock. On this morning before nine we heard the milk bottles rattle, less than two hours late, and our driver assured us that he had served every customer, leaving the barn at half-past two, in the worst storm he had ever experienced.

I tried to picture a man huddled up in a milk-wagon breaking through snow-drifts from two to four feet deep, ac-

tuated by only one impulse, and that to serve the women and children on his route with their milk supply. Since that time I have marveled that a city the size of New York, with its teeming millions, should enjoy uninterrupted milk distribution all seasons of the year. And as I write this I cannot help a lump from rising in my throat to think that some of the milk-wagon drivers of New York City should have sullied a record that any man or body of men in the world could feel wonderfully proud of by voluntarily stopping the distribution of milk throughout the city. Unfortunate? Yes. Because a few heated, blind moments, temporarily at least, turned the sympathy of milk consumers against men who were admittedly a corner-stone in service to every family in the great metropolis. I want it to be only temporary, and I hope that the American public will close the record of those few weeks when the men were on strike. Forget about them, or, at least, weigh them in the balance with the valorous work performed uncomplainingly by milk-wagon drivers outside of those few weeks above mentioned.

They are deserving of as much credit as any other class of citizenry in New

York City in maintaining a service that the health of the city depends upon to such a large degree.

Yes. Picture these milk-wagon drivers in rain and sleet, snow and ice, bad wind or fair weather, leaving the milk depots at three o'clock every morning. No matter what the obstacle may be, milk is on hand—possibly a few minutes late, or, under practically impossible conditions, an hour or two—but it always arrives. Certainly these protectors of public health are deserving of as much credit as any other element of American society.

The morning of the great blizzard set me to thinking. What kind of an organization was behind the milk-wagon driver? Milk did not pour out of the clouds; there must be prodigious efforts continually performed by men and organizations that handled the milk before it was delivered to the wagons at 3 A.M. On this morning train traffic was practically tied up in local sections all over the State of New York, yet we received our milk; not milk to be afraid of, but the purest, finest milk possible to be obtained. According to the unqualified statement of Dr. Royal S. Copeland, Health Commissioner of New York City,

RAW MILK FROM THE COUNTRY—INSPECTION BEFORE PASTEURIZATION. SHIPPING-CAN WASHER AND DRIER IN BACKGROUND

"the most sanitary and efficiently handled milk service in the world is rendered by New York milk distributors, whose performance is unsurpassed and unsurpassable. The pasteurized milk distributed in New York is absolutely free from pathogenic germ life, and, as a result, infant mortality in New York City has been reduced from two hundred and forty in 1891 to seventy-one last year per thousand—a decrease of more than seventy per cent." Other cities may come up to New York in many standards of public service, especially the urban centers of the Far West, but when it comes to milk New York stands in the forefront of any other metropolitan city.

The New York mother can feed her infant, no matter how young, with the pasteurized milk delivered to her door every morning without the slightest fear that there may be pathogenic germ contamination; surely a great load to be lifted from the shoulders of the average anxious mother.

Pasteurization did not happen overnight. Behind the scenes of the experimentation and introduction of commercial pasteurization of milk lies one of scientific, sanitary development, every bit as interesting and startling as the most interesting stories of modern sanitary campaign waged by General Goethals in the Panama Canal Zone. The story of American milk pasteurization is one of indefatigable endeavor and unstinting sacrifice of public-spirited men. Pasteurization was first introduced in this country in an experimental way by Nathan Straus. There is a story behind Mr. Straus's deep interest in sanitary milk distribution that demonstrates that oftentimes a seemingly insignificant incident results in revolutionizing entire industries.

Mr. Straus owned a farm. He had a herd of prize milch cows. One of his pet cows died, and an autopsy conclusively proved that the death of the animal had been caused by tubercular infection. Investigation proved to Mr. Straus that the infection of his pet bovine had been caused by a man with tuberculosis handling the hay fed to the cow. If the eating of a tubercular infected handful of hay could cause the death of the animal, what, Mr. Straus immediately asked himself, would happen to the unsuspecting public that consumed the milk given by such a cow? He immediately began to investigate the Pasteur method of elimination of pathogenic bacteria by a modern scientific invention called pasteurization. In 1892 Mr. Straus established a milk pasteurizing laboratory and distributed milk from five depots, which operated throughout the first year and steadily increased until commercial pasteurization of milk became a fact in New York City. Mr. Straus was bitterly attacked, but kept up his courageous battle, and the New York public in particular, the American public in general, owe Mr. Straus a debt of gratitude that they will never be able to repay.

In 1902 Mr. Loton Horton, President of the Sheffield Farms Company, Inc., became deeply interested in the pasteurization of milk on a commercial basis. Investigation proved that in Berlin, Germany, where the pasteurization of milk was compulsory, infant mortality had decreased over sixty-six per cent. Mr. Horton went to Europe; he became thoroughly satisfied that pasteurization on a commercial basis was not only possible but absolutely necessary for the protection of public health. He began a remarkable series of thorough tests, employing the most noted bacteriologists in

America. Mr. Horton, without regard to expense, experimented until he had brought commercial pasteurization to a stage where the elimination of all pathogenic germ life was a positive fact. He was not satisfied with the twenty-five-minute retention of milk at a temperature of 146°, and so, as a final test for absolute certainty, turned over a pasteurizing plant at 130th Street and Broadway, New York City, for experiments, and there, with the assistance of Dr. Park, Director of the Research Laboratory of the Department of Health, New York City, and Dr. Rosenau, of Harvard University, various comparisons of milk, held at different temperatures for various periods of time, were made.

I asked Mr. Horton about these tests; I drew his attention to the fact that, even though laboratory tests might not disclose the presence of germs, it might still be possible for them to exist in some cases. "Quite so," he admitted; and then enthusiastically added, "We proved the total absence of living pathogenic germs by using hundreds of pigs in our experiments."

"Pigs?" I queried, astonished. "Great heavens, you don't class the frailties of a human with the ruggedness of pigs? Pigs kill rattlesnakes by shaking them to death; they are bitten, but do not become poisoned. There certainly has never been a human being that could take a rattlesnake in its teeth and shake it to death, and be immune to its bite while doing it."

"Oh," he replied, "I don't mean Poland Chinas; I mean guinea-pigs."

This was some relief to me. Mr. Horton continued: "You see, guinea-pigs very easily become infected by pathogenic germs. They are extremely sensitive. We took no chances. We finally found, after exhaustive tests, that by inoculating the pigs with milk subjected to a Fahrenheit temperature of 145° for thirty minutes not a single trace of disease-breeding bacteria remained. We therefore leave our milk exposed to 146° Fahrenheit for fifty minutes, which eliminates any possibility of a living pathogenic germ."

Personally, I have always been convinced of the efficacy of pasteurization; yet I have heard so much about "milk from contented cows" that I put one more query: "Would it not be possible to install the latest methods of sanitation in country dairies, whereby the care of milk-producing cows would eliminate the chance of their being infected, and thereby save to the public the added cost pasteurization causes?"

"Well," replied Mr. Horton, "that is being done, and in some places with a great deal of success. However, we find the finest herds in the world existing under the latest sanitary conditions, and still the owners of these modern farms are continually forced to destroy their cattle because of the discovery of tubercular infection."

This statement is verified by the ex-

perience of the late J. Pierpont Morgan, who had a herd composed entirely of pedigreed animals. Mr. Nathan Straus, in his book on "Diseases in Milk," points out that several years ago a third of this valuable herd was killed on orders cabled by Mr. Morgan after it had been discovered that they were infected with tuberculosis. Mr. Straus had written shortly before this pointing out to Mr. Morgan that his physician had made a report on the Morgan dairy farm and found it to be the best example in the country of a scrupulously clean, sanitary farm, but directed his attention to the fact that he did not pasteurize his milk. I should imagine that it was some shock to Mr. Morgan, six months later, to learn that one-third of this model herd had tubercular infection. This certainly proves that under the most favorable circumstances milk from even the most carefully selected cows is not entirely free at all times from the presence of living pathogenic bacteria.

Mr. Horton so impressed me with the necessity of proper pasteurization that I requested permission to go through his seven large pasteurizing plants in Greater New York.

I received the surprise of my life when I entered one of the pasteurizing plants and learned that milk receives more careful attention in a pasteurizing plant than a patient receives in the most modern hospital. I found a "factory" where, from the time that the milk began its journey through the plant, it never touched human hands. Even better, the milk does not touch human hands at any time, from the farm to the consumer.

When the Sheffield Farms Company, of New York, first built their great pasteurizing plants, they were severely condemned in many quarters for spending so much money on sanitary plants, which cost must necessarily be added to the price of milk. Just as well argue that New York City should save the greater portion of the \$170,000,000 now spent each year on supplying its residents with pure water, when they could just as easily pump their supply from the upper Hudson River and save this great expense to the public.

As I started my journey following a can of milk through the plant, the superintendent outlined to me the trip the milk had already taken from the farm to the city. Dairymen, under State supervision, had delivered their milk to the creameries, and the milk, before it was placed in the refrigerator cars, had been thoroughly inspected by State authorities. It was then brought to the city in cars properly iced, held at an even temperature, rushed from the city's freight station direct to the great pasteurizing plant, where it was immediately taken on a conveyer to the top floor of the plant, and started on its journey to the bottle on the ground floor. At the top of the station, just before the milk is dumped from the cans into a thoroughly sterilized hopper, I noticed a

Courtesy Sheffield Farms Co.

PASTEURIZING ROOM—CAPACITY SIXTEEN THOUSAND QUARTS PER HOUR

Top landing, milk heaters—cold raw milk raised to 146° F. Next landing, holding cylinders—hot milk retarded fifty minutes. Next landing, coolers. Next landing below and on street level, bottle fillers and cappers. A bottle filler is shown on the succeeding page

big man lift a can top off and smell it. This aroused my curiosity. "What's he doing?" I asked the superintendent.

"Ask him. He's one of the most expert men on the job."

Just as I reached the "expert" he yanked a ten-gallon milk-can out of the conveyer. "What's the matter with it?" I asked.

"Tainted," he snapped.

Personally I can detect sour milk a mile off, but I was unable to notice the slightest taint in this can of milk; but this expert "smeller" apparently was a better "expert" than the State authorities who had inspected it some hours earlier.

"Do you find many?" I queried.

"I find them now and then. That's what I'm paid for. That milk could pass through and nobody would ever know the difference." But the "factor of safety" consideration "gets the tainted can."

The milk passes through the hopper into a centrifugal clarifier, which removes every particle of foreign matter that may be in the milk. Mechanically clean, it then flows into a tank, from which it passes to the heater of the

pasteurizing equipment. Here the milk is carefully regulated to feed eleven thousand pounds an hour into its respective pasteurizer.

"Why this control?" I asked.

"Well," he said, "we've got to make it fool-proof. Men may get in a hurry. Under this system they can't. The job is done right whether they want to do it or not."

The milk then flows down over the outside of a series of sterilized tubes, its temperature being raised to between 145° and 146° Fahrenheit. The time of raising to this temperature is approximately one minute, and again the controlling machinery comes into use. The milk flows from the heater through a system of holding tanks, automatically requiring at least fifty minutes to pass through, the temperature never varying over one-half degree in that entire time.

I noted that the machinery was regulated so that under no circumstances could the milk pass through these tanks without being held at least fifty minutes. I asked, "Why all the great care?"

"Sometimes a workman may want to go to church or keep a date with his 'best.' He cannot shirk his duty under

Courtesy Sheffield Farms Co.

A ROTARY FILLER AND AUTOMATIC CAPPER—CAPACITY EIGHTY-FOUR BOTTLES PER MINUTE

A measured amount drops in each bottle. The milk flows to this machine from the cooler shown on the preceding page

this regulated control system. We hold the milk fifty minutes instead of thirty, as is supposed to be sufficient, allowing this difference as another 'factor of safety.'

From the holding tanks the milk flows down over a cooler, which reduces its temperature to 40°. Here a system of gauges and automatic controls eliminates the danger of any possible error on the exact degree of temperature, there being three gauges on each tank, or holder, which again guarantees absolute protection from possible human error. From the cooler the milk passes into a tank with an electrically driven agitator, which supplies the mechanical bottle and can filler.

The pasteurized milk is then bottled by a newly invented machine which fills the bottles and caps them at the same time with wonderful rapidity, eliminating the necessity of a human hand coming in contact with either bottle or paper cap in the complete operation.

Not only does a human hand never touch the milk at any time, from the pasteurizer to the bottle, but even the air in the milk-room is thoroughly purified. Every particle of air is filtered before going into the room, and an automatic exhaust lets the air pass out; but it is absolutely impossible for a single particle of air to get back into the room without going through the filter.

I remarked about this. "Well," replied the superintendent, "it would certainly be foolish to spend millions of dollars in machinery and equipment to guarantee safety from germ life, and allow the milk to come in contact with germ-laden air. You see," he added, "germs are as fine and about as light as dust, and naturally are carried through

the air. Well, they don't come in contact with our milk. And then," he confided, "the 'Old Man' is a crank on bugs. He fights bugs like Foch fought Germans. He's around here about half the time himself, and he'd blow up the factory if he found any place where a bug could get in. Of course I mean germ bugs, and," he added, "as a matter of fact, any other 'bug.'"

Pasteurizing from the holding tank to the bottle takes place in an enormous room completely tiled, with the overhead a solid expanse of glass. It is light enough in any part of that room, or any corner, to detect the tiniest flake of dust. I believe that was the most spotlessly clean room from ceiling to cellar that I have ever been in in my life. I have been a chronic objector for many years to the price of milk, but since going through these plants and seeing the immense amount of handling and money spent for protection of New York children, millions spent in modern sanitary equipment, I can begin to realize why there must be a difference between the price to the producer and the price to the consumer.

As we left this pasteurizing room I heard a great racket. It sounded like a boiler-shop on a busy day. It was the clinking of bottles—thousands of bottles. "Yes," smiled the superintendent, "here is one of our biggest problems, and one of the most costly that enter into milk distribution."

Bottles came in in crates on conveyors, literally by thousands, were plunged into a steaming vat, thoroughly cleaned and sterilized by forced pressure, and washed in a strong alkali solution. They then went through a vat where they were rinsed in clean, hot water at

a temperature of 160°. As they came out the bottles were inspected; they then went through a sterilizer, where they were subjected to boiling water of 212°, and from the time they leave this sterilizer until they are filled and capped no man's hand touches them. After being sterilized they pass over electric lights, where they are further inspected. When filled and capped by the automatic machinery, they again travel on conveyors to the inspection room, where they are again inspected under electric lights and pass several experts, who now and then take a bottle out of the conveyor when they find a speck that has still got by, although this speck of dust has been sterilized. The inspector grabs it with as much enthusiasm as if it contained deadly bacteria.

I can bear witness to the fact that the bottles are washed in real hot water. I touched the bottom of one of them as it left the sterilizer, but I did not touch it for long. With a howl of pain, I asked the inspector why it was necessary to have the bottles so hot.

"To kill the bugs," he answered.

"But," I remonstrated, "it doesn't take 212° to kill a bug, does it?"

"No, it doesn't," he answered, dryly; "but, you see, the 'Old Man' always makes us observe the 'factor of safety.'"

A very interesting part of the milk distribution is the loading of the wagons. A driver drives up to the loading station platform, and in less time than it takes to tell it he has the necessary number of bottles and is on his way, making room for the next one. It is hardly necessary for him to stop his horse, the operation is so rapidly performed.

In connection with the cost of milk distribution, the delivery of a quart of milk by a driver who travels many miles and climbs from a hundred and fifty to a hundred and seventy-five flights of stairs, which are generally dark when he makes his rounds, naturally incurs a great expense even under the best-organized system of delivery. I have made many inquiries at department stores, and find the average cost of delivering a package to a customer, from a needle to a suit of clothes, is between twenty and twenty-four cents. The cost of delivering milk does not exceed twenty per cent of this figure. It is interesting and illuminating to know that the milk-distributing firms make the same profit selling milk in bulk at nine cents a quart at their stations throughout the city that they make from exactly the same grade of milk delivered to the consumer's door at fifteen cents a quart. There is food for thought in this fact, although there is a possibility of germ contact in containers used to hold loose milk, and Dr. Copeland strongly advises the use of bottled milk from a standpoint of absolute safety, even though more costly.

Bottles! The story of bottles is a startling one. Bottle breakage costs the Sheffield Company alone over six hundred thousand dollars a year. If the

DELIVERING MILK IN THE CITY

The milk industry, with all its improvements, as evidenced by the elaborate system for controlling the pasteurization of milk, shown at the left, is still conservative in its city delivery system, as indicated in this picture

average housewife realized that the milk bottle she is often so careless with costs from five to six cents, she would probably handle it with the care it deserves. I have been literally amazed at the terrific cost of broken bottles to the milk consumers of New York City. I suppose that holds good for every city in the United States. If a cat sets up a howl in the back yard, a milk bottle is the first object sent after it. I have seen many times in my three years of apartment life in New York City bottles carelessly thrown on dumbwaiters, resulting of course in many of them being broken. I have seen superintendents of apartment-houses throw the bottles on floors and break them, as if they were newspapers instead of precious five-cent pieces.

Walking down Ninety-fourth Street, near Central Park West, I heard the familiar rattle of broken bottles as an ash collector threw a can of refuse into his wagon. I gazed at the ash-cart. There were at least twenty-five milk bottles visible, and at least half of them broken. "What are you doing with those bottles in those ash-cans?" I asked, amazed at this wanton destruction.

"I've got no time to monkey picking the bottles out of these cans. If the people in these houses haven't any more sense than to throw these good milk bottles into ash-cans, I should worry. I find hundreds and hundreds of these bottles every day; half of them are broken in the handling of the can; many are broken when the ash-cart is dumped, and I don't care what happens to the unbroken ones after that."

Here are thousands of people kicking about the cost of milk, and yet these very same people are adding tremendously to the cost of the milk by throwing their empty milk bottles away like potato peelings; and every time a housewife breaks a bottle she adds a nickel

onto her milk bill; indirectly, quite true, on the weekly bill, but certainl, directly on her monthly bill. A little bit more care in the handling of bottles by the New York milk consumers would save them around a million dollars a year, considering the total milk distributed in the city by all companies. One milk authority assured me that two million would be a closer estimate.

Europe paid American progressive ingenuity a fine compliment recently. The greatest milk distributing firm in England, the United Dairies, Ltd., desiring to adopt the best scientific and sanitary methods in diminishing infant mortality in London, sent a commission, including some of their own directors, to investigate the leading pasteurizing systems of America, as well as Canada, and, on returning to London, they wrote Mr. Loton Horton as follows:

We were profoundly impressed with the methods in operation in the best dairies in all parts of your great continent, but, with a very thorough knowledge and appreciation of these, we have no hesitation in ascribing to your methods and work the foremost position in the world, and we should indeed be happy if, with your kind guidance, we were able to introduce and popularize these methods in England.

It is because we are convinced that your system best meets the demands of hygiene, promotes child welfare, and avoids culpable waste of milk that we are constrained to ask you to add to your present heavy burden of responsibility by assisting us out of your great experience in the task which lies before us of improving methods in this country.

This is indeed a sterling tribute to American leadership in protecting the public against unwholesome milk.

There is a human interest story behind the awakening of the great English

dairy firm in American methods of milk pasteurization. Mr. Nathan Straus had bombarded the English public for years regarding the almost criminal negligence displayed by English authorities in protecting the London public from disease-laden milk. A peculiar circumstance aided in bringing about a successful termination of his efforts.

Dr. Royal S. Copeland's son became very ill while visiting in London through the drinking of contaminated milk. Dr. Copeland became very wrathful. He addressed a small body of men in London shortly afterward, at which time he vehemently declared: "I don't care if you folks drink this kind of milk yourselves, but I should think you would have some decent milk to give visitors." To which they replied, recognizing the truth of the statement, "Would you tell that to Lord Astor?"

"I would tell it to the King himself," answered the Doctor. Immediately a conference was arranged with Lord Astor, who, together with Lady Astor, became so much interested in the subject that a commission was delegated to visit America for investigation of the latest methods of milk pasteurization and distribution.

This commission, after an exhaustive study which carried them all over the United States, wrote Mr. Horton as before quoted, and, as a result, Mr. G. E. Huling, chief engineer of the Sheffield Farms, was requested to serve and is now serving as consulting engineer to this English commission.

With the aid of the municipal health authority, Dr. Copeland; the father of milk pasteurization, Mr. Nathan Straus; and the pioneer wholesale distributor of thoroughly pasteurized milk, Mr. Loton Horton, the English metropolis may soon enjoy the same pure, germ-proof milk that the American metropolis has enjoyed for some time.

THE BOOK TABLE

AMERICAN PORTRAITS¹

BY LYMAN ABBOTT

THESE are portraits, not biographies. He who wants to know what these men *did* must go elsewhere for his information. He who wants to know what these men *were* will find in this book a perfectly frank and very luminous interpretation of their characters. The great portrait painters are never content with an accurate presentation of the features of the sitter. They study him while they talk with him, and aim to reproduce, not merely the house in which he dwells, but the man himself.

This was Mr. Bradford's aim in this interesting volume. He seeks to interpret the inner life of the sitter, and finds it difficult to do so. "Souls tremble and shift and fade under the touch. They elude and evade and mock you, fool you with false lights and perplex you with impenetrable shadows, till you are almost ready to give up in despair any effort to interpret them." To be a true portrait painter, whether with pen or brush, requires much more than skillful technique; it requires insight and courage—insight to perceive the real men behind the mask which consciously or unconsciously we all wear, and cour-

age to report without fear or favor what one has seen.

To illustrate Mr. Bradford's insight, take this sentence interpreting the temperamental conservatism of Cleveland: "The Bible is good enough for me," he said; "just the old book under which I was brought up. I do not want notes, or criticism, or explanations about authorship or origin, or even cross-references. I do not need them nor understand them and they confuse me." It was that temperament that made him not merely a Democrat, but an "old-fashioned Democrat." He was almost impervious to new ideas.

To illustrate Mr. Bradford's courage, read his interpretation of Mark Twain: "His thought was bitter because it was shallow; it did not go deep enough to get the humble tolerance, the vast self-distrust that should go with a dissolving vision of the foundations of the individual universe. His writing alternates from the violence of unmeaning laughter to the harshness of satire that has no laughter in it."

One does not need to agree with all of Mr. Bradford's interpretations to welcome his volume as a luminous and courageous interpretation of eight of America's great, though not greatest, men.

¹ American Portraits (1875-1900). By Gamaliel Bradford. Illustrated. Houghton Mifflin Company, Boston. \$3.50.

THE NEW BOOKS

FICTION

HERITAGE OF THE HILLS (THE). By Arthur Preston Hankins. Dodd, Mead & Co., New York. \$1.75.

Out of every half-dozen stories of mining mysteries and other Western "movie stuff" about one or two have something more than thrill and jump. This is one of the small minority. It is an original tale in its incidents, and it is also told with ability and graphic power.

MOON ROCK (THE). By Arthur J. Rees. Dodd, Mead & Co., New York. \$2.

Mr. Rees is a prolific and successful writer of mystery and crime stories. He has here built up his edifice of mystery with solicitous care, and puzzles his reader with his customary art. No one, however, need feel chagrined at not guessing the mystery; for this is one of a class of crime stories in which it is morally impossible to solve the problem, for the simple reason that a series of important facts which explain the cause of the crime are not known by the reader until after he has wasted a good deal of gray matter trying to guess what is unguessable.

UNCLE BIIAH'S GHOST. By Jennette Lee. Charles Scribner's Sons, New York. \$1.50.

Did Uncle Bijah really have a ghost, or an astral influence, or just a moral influence? The author does not seem to be quite certain herself, and the reader

is entitled to his own opinion. Mrs. Lee writes here, as in her other stories, with sharp presentation of individual traits and character and with brisk talk and action.

HISTORY AND POLITICAL ECONOMY

CANADA AT THE CROSS-ROADS. By Agnes C. Laut. The Macmillan Company, New York. \$2.50.

In this volume various reasons are given for the fact that Canada does not receive full profits from her national resources. Whatever Canada's present economic outlook, however, she has enacted some exemplary legislation of an economic nature—for example, the Industrial Disputes, the Soldiers' Settlement, and the Selective Immigration Acts. Of the last named, we read:

When the immigrant reaches the port of entry, he is not dumped in the nearest city. He is met by a government agent and guided to his destination. Is he a factory operative? To the factory and waiting job he goes. Is he a farmer—and it is the farmer for whom Canada particularly bids—he is put on the train and sent to the farm areas for which he has expressed a preference. At the farm destination he is again met by a government agent and again—if he so wishes—guided to his location. It is where colonists have resented this guidance and persisted in choosing poor locations that they

have come to grief. The same paternalism, or maternalism, if you like so to call it, is exercised regarding incoming women colonists. Single women are selected on the other side of the Atlantic. They are brought out under care of a woman immigration officer and placed in the positions for which they are especially qualified—the great need in Canada, as elsewhere, being domestic help.

To the student of economics the book's value would be doubled had it an index.

MEXICAN MIND (THE). By Wallace Thompson. Little, Brown & Co., Boston. \$2.50.

Even more interesting than Mr. Thompson's previous volume on Mexico is his present work—a comparison of the mental processes and differences characterizing the Latin and Saxon peoples of the North American Continent. In addition, there is a running commentary on certain curious customs of Mexican life. No one of course will be surprised that Mr. Thompson's solution of Mexican problems is found in the education of the masses.

EDUCATIONAL

DICTIONARY OF ENGLISH PHRASES (A). By Albert M. Hyamson, F.R. Hist.S. E. P. Dutton & Co., New York. \$5.

A very useful book, which will be consulted frequently to verify or define familiar terms and phrases and will usually be found not wanting. More obsolescent and banal terms are included, however, than would seem to be desirable, and fewer of the newly coined ones that have obtained currency. "Big Bertha," "Jerry," and "World War" are significant omissions of this sort. Americanisms receive much more attention than in some other similar books of British origin.

HAUNTS OF LIFE (THE). By J. Arthur Thomson. Illustrated. Harcourt, Brace & Co., New York. \$2.50.

Professor Thomson describes in this book many strange forms of life that are found in out-of-the-way places—the seashore, the depths of the ocean, mountain heights and underground caves. But his book also has a wider scope. It is a commentary on the development of animal life in many forms—on land and sea and in the air; and it handles its entire subject in a way that will both fascinate and inform readers of all ages.

MISCELLANEOUS

COWBOY (THE). By Philip Ashton Rollins. Charles Scribner's Sons, New York. \$2.50.

A thorough study of one of the most interesting types of humanity that America has produced. The real cowboy is described here—a being somewhat different from the cowboy of the movies and the novels, but fully as interesting as pictorial or literary fiction has ever portrayed. The cowboy's character, habits, amusements, equipment, environment, and influence on the development of the West all receive exhaustive but always entertaining and discriminating treatment.

GOOD TEETH AND WOMANLY BEAUTY

THE IMPORTANCE OF DAILY CARE BEFORE DECAY BEGINS

WOMAN'S crowning glory may be her hair, but no woman who has an appreciation of the real meaning of beauty can believe that lovely hair would make her beautiful if her teeth had been neglected. Good teeth are, indeed, the first requisite of feminine attractiveness.

The artist who portrays smiling beauty gives his subject a full set of good teeth. The novelist, describing the charms of his heroine, is almost sure to refer to her beautiful teeth, and in real life the woman who is admired must have teeth that make her "unafraid to smile."

Rousseau said: "If she has good teeth no woman can be ugly."

PREVENTION BETTER THAN CURE

NATURE, unfortunately, is not impartial in distributing strong, beautiful teeth. Some people have teeth that require little care; others—the great majority—find that constant vigilance is the price of freedom from tooth troubles.

Neglect, in most instances, is followed by discoloration, decay, distress, and finally the loss of the affected teeth, and disfigurement. It is most important, therefore, to give the teeth watchful care—to clean them at least twice a day with a safe dentifrice—before decay begins.

"The reparation of beauty lost through neglect of the teeth," says Irma Frances Dupre in a recent magazine article, "is a task so disheartening, so difficult, and so expensive, as to be a bitter lesson to the woman approaching middle age and regretting the carelessness or indifference of her younger days toward the proper care of this most precious of possessions."

The daily use of a safe dentifrice and an examination of the teeth every six months by a dentist are requirements that no woman can afford to neglect, and every woman who has children should consider it

her duty to see that they pursue this sensible course.

Brushing the teeth night and morning need not be a task. Colgate's Ribbon Dental Cream, with its delicious flavor, makes it easy to induce children to acquire the healthful habit of cleaning their teeth twice a day, and adults also find that the use of Colgate's imparts a pleasure to the practice of dental hygiene. Colgate's cleans teeth the right way, *safely and thoroughly*, and is recommended by more dentists than any other dentifrice.

BAD TEETH A MENACE TO HEALTH

DURING the past few years widespread alarm has been aroused over the dangers that arise owing to the presence of "dead" teeth in people's mouths.

Eminent physicians insist that every dead tooth is likely to be a source from which poison will find its way through the system.

Dead teeth are held responsible for rheuma-

tism, indigestion, heart troubles, impairment of sight, and other dangerous ailments. Development of public interest in the importance of dental hygiene has naturally been followed by the appearance of many kinds of tooth pastes and powders, for some of which extravagant claims are made. It is always advisable to be cautious regarding the use of preparations that are alleged to possess merits which cannot be verified.

Look into the character and responsibility of the house that produces the dentifrice you are using and keep in mind the fact that truth in advertising implies honesty in manufacture.

Notwithstanding the advice that is given by physicians and dentists concerning care of the teeth, it happens too often that thought is given to the subject only when exposed nerves give painful warning of trouble that might have been prevented.

In addition to the difficulty of repairing teeth that have begun to ache, the operation usually is so distressing to the patient that it becomes necessary to kill the nerve. Then there is another "dead" tooth, with all the dangers that accompany it.

The care that is necessary to prevent tooth troubles never can begin too early. Children's first teeth should be cleaned regularly; they should be treated by the dentist, if necessary, and the gums should be kept in a healthy condition. Such precautions are quite likely to have a desirable effect upon the second teeth, which will have a chance to develop properly, come in regularly, and be sound and strong.

"In the whole range of hygiene," said Dr. William Osler, "there is nothing more important than dental hygiene."

THE SAFE, SENSIBLE COURSE

IT is important to remember that the most valuable part of a tooth is its surface—the thin shield known as enamel, which Nature provides for the protection of the inner structure. Injury to the enamel exposes the tooth immediately to the danger of decay. The smallest scratch or break provides a lodging place and a point of attack for the microorganisms that are responsible for cavities. Once the enamel is scratched by the application of an abrasive that is too harsh, the damage is permanent. Nature does not repair the injury.

Whenever and wherever particles of food or other foreign substances are left clinging to teeth or wedged between them, fermentation ensues, acid is generated, and decay follows.

Cleaning the teeth regularly night and morning with Colgate's Ribbon Dental Cream is the safe, sensible course for men, women and children. Colgate's is free from injurious ingredients; its purpose is simply to *clean* teeth, which it does effectively, and this is all that any dentifrice should be expected to do.

You can buy Colgate's anywhere. It is recommended by high dental authorities, and it has many advantages in addition to its effectiveness as a safe cleanser. The ribbon, as it is pressed from the tube, lies flat on the brush; the delicious flavor makes its daily use a pleasure and it does not dry out or become hard or brittle.

cleans teeth
the right way

It is safe and efficient; contains no harmful ingredients; the flavor is delicious.

For Good Teeth—Good Health, use Colgate's Ribbon Dental Cream regularly night and morning. Large tubes 25c. Why pay more?

NEW YORK

**"How sleep the brave who sink to rest
By all their country's wishes blest"**

HIS end may have come aboard transport or in some front-line trench—in a base hospital or a training camp at home. It matters not where or how—remains simply the fact that he died for his country.

Simply to mark in cold and stately marble the unresponsive sod is not enough. The memory of his supreme sacrifice should be a heritage for the ages. It is more fitting, more consoling, far, to give his spirit and soul enduring memorial where congregate those he regretted so to leave.

What place among the haunts of men more fitting to erect such a memorial to the departed than within the sacred walls of the House of God where spirit speaks to spirit in many an expressive and symbolic form, and where the ideals and sacrifices of the dead live on to inspire and quicken the living.

You owe his memory such a memorial in his or your own favorite church. It is never "too late" for such a tribute. Perhaps but a simple hymn-board, or, on the other hand, a chancel and altar complete, a console for the organ, the pews, a communion table, or a baptismal font.

Every piece has embodied in it the genius of our chief artist and sculptor, Alois Lang, one of the most renowned of living wood sculptors. He is a member of the famous Oberammergau family of Langs, whose art and skill as wood carvers has been traditional for centuries.

To those who desire to perpetuate the name and memory of some one near and dear, we offer the service of our Ecclesiastical Department. A request will bring without obligation a beautifully illustrated booklet and complete information.

RADIO'S MAGIC WAND

RADIO is swiftly revolutionizing the thought, expression, and habits of the world. The transformation is taking place with dramatic celerity. Already it seems probable that this new resource of civilization will affect the lives of the people more intimately and change the currents of human activity more radically than the introduction of the locomotive, the harnessing of electricity, the telephone, automobile, or the moving picture.

Radio, like other discoveries, is creating new industries, new fields of employment. It is opening up new avenues of education and entertainment, of public information, health protection, and life saving. Its early sensational service was in saving life and property at sea. Its present great opportunity is to give to remote and isolated communities the educational and recreation facilities which hitherto have drawn youth away from the land to the crowded cities.

Already radio, through quick action by representatives of the Government and patriotic response by American industry, has been retained for the leadership of the United States in the field of international communications.

The General Electric Company, whose development work has done so much to make practical the theories, experiments, and original patents of Marconi, was induced by the request of representatives of the Navy Department to enter the field itself instead of selling apparatus to foreign interests already entrenched in America. It was in response to the suggestions of the Government that the Radio Corporation of America was formed to take over the assets and patents of the American Marconi Company, making it a purely American company; and the position of America is now safe and vigorous in the field of international radio communications.

While from a National standpoint this is still the most important achievement in radio, the broadcasting of news, entertainment, and official information unquestionably is responsible for the popu-

Brand-New: From Factory to You.

BIG SAVING

This beautiful machine is the only brand-new (unused), standard, full-size typewriter with a 4-row, 42-key, 84-character Universal keyboard that you can buy for less than \$100. It comes direct from factory to you at practically the wholesale price of other high-grade typewriters—a remarkable saving.

Free Trial

Use Annell' on your work at our expense, put it to the test for ten days; then if it doesn't satisfy you in every way, return it to us and we will refund even the express charges. You take no risk. Could anything be fairer?

Easy Terms

While you are using the machine, small monthly payments scattered over a period of more than a year make it easy and convenient to own this full-size, brand-new (unused), 4-row, standard-keyboard typewriter.

Mechanical Marvel

Strength and simplicity are the outstanding qualities of this machine. It embodies the ideas and experience of mechanical geniuses who have been making typewriters for generations. Every essential operating convenience is possessed by Annell', including the 4-row, 42-key, 84-character Universal standard keyboard. It will last a business lifetime and is fully covered by an ironclad guarantee.

RADIO'S MAGIC WAND (Continued)

lar interest in radio which is now sweeping the country.

Nearly all the public, especially that part of it located near the broadcasting stations, is familiar with the results of radio—the concerts and lectures and information that constitute the daily programme that goes out from the broadcasting stations and into the radio telephone receiver sets now found in so many homes. Dealers have studied the business side, expert amateurs the send-

ANCHORING THE FILAMENT

ing and receiving side, the entire public the popular side, but very few are familiar with the interesting inside—the very heart of radio reception and transmitting—known technically as the vacuum tubes, which act as transmitters, detectors, and amplifiers. These constitute the magic wand of radio.

These are not only the scientific heart of radio, but the very source of the development and still the limiting factor in the production expansion programme. The explanation of what they are, whence they came, and how they are made cannot fail to be helpful, not merely to one group, but to the public generally.

The vacuum tube is a veritable Aladdin's lamp of radio. To it we owe the marvelous development of radio communication and, above all, the growth of broadcasting. Its history, like that of most great inventions, is a history of an accidental discovery and of a groping for the explanation of that discovery over a period of twenty years.

We must go back to 1883 for the beginnings of the vacuum tube—back to the days when Edison with dramatic suddenness displayed his carbon filament lamp. For it was Edison who first discovered the phenomenon which is now practically applied in the vacuum tube. In that eventful year, 1883, the idea of performing a curious experiment flashed upon Edison. He mounted a plate within the bulb of his exhausted carbon lamp and connected the plate with a current-indicating instrument—a

galvanometer. He turned on the current to the filament. It glowed, as filaments always glow in such circumstances. He looked at the galvanometer. The indicating needle had swung aside. *A current was streaming over from the glowing filament to the plate.* And yet there was no physical contact of plate with filament! Edison could never make the current flow from the plate to the filament. It would only stream from the glowing thread to the plate.

Sir William Preece, a famous English physicist, called this phenomenon the "Edison effect." But what the Edison effect was neither he nor Edison could explain. Indeed, it was a mystery for over twenty years. The Edison effect proved so baffling simply because scientists did not know enough about electricity to clarify it. Not until radium and the X-rays were discovered, not until the very nature of electricity and of matter was understood, was it possible to explain exactly why the current streamed over from the hot glowing filament to the cold plate, and never in the opposite direction. Then came the research of Sir J. J. Thomson. His conclusions were startling. Electricity is a matter of flowing "electrons"—infinitesimal bits of negative electricity. The electrons are always negative. They manifest themselves only when a body is in an abnormal condition—when, for example, it has too few or too many electrons, and never when it has just enough. They seek to find their own equilibrium, these electrons. They dart from bodies which have too many to bodies which have too few. Every hot metal, every burning thing, discharges them by the billion. From the glowing filament of a carbon lamp they stream out in every direction. When Edison mounted his plate within a lamp bulb and charged it *positively*, he gave the electrons a definite direction; he made them move from the hot filament to the cold plate. Every boy knows that the north pole of a magnet attracts the south pole of another magnet. The north poles repel each other; so do the south poles. The electrons streamed over from the negative filament to the positive plate by a somewhat similar process. When the plate was negatively charged, the electrons, which are always negative, were repelled. The plate had electrons enough; it wanted no more. It occurred to Professor J. A. Fleming, who was Marconi's chief engineer and who had much to do with explaining the Edison effect in terms of electrons, that a lamp which included a plate might serve a useful purpose in radio communication. We deal with alternating currents in radio, and by alternating currents we mean streams that flow, not in one direction, as water flows through a pipe, but in two directions. In other words, an alternating current flashes back and forth. In radio these oscillations occur with amazing frequency. Between two successive alternations of electricity or waves may be an interval of only half a millionth or a millionth of a second. Fleming was seeking a

RADIO'S MAGIC WAND

(Continued)

detector which would respond to these high frequencies better than existing devices. A telephone would answer admirably as a receiver. Unfortunately, the telephone would not respond to alternations so rapid with audible sounds. It occurred to Fleming that the Edison effect could be applied in such a way that the telephone would become a receiver of radio signals.

Remember that the electrons stream only from the hot filament to the plate. Fleming saw that if a bulb containing a plate formed part of the apparatus which received the electric waves hurled into the ether by the transmitting station it would suppress one-half the alternations. The electrons could flow only from the filament to the plate. When an alternation came in the opposite direction, the bulb simply would not respond; that alternation was simply choked off. Hence the bulb converted the alternations into spurts of electricity, all traveling in the same direction, and these were so far reduced in number that they could be heard in a telephone receiver as a musical note. The dots and dashes of the Morse code were therefore heard as short and long notes.

The action of the bulb was much like that of a valve which permits water in a pipe to flow free in one direction, but which promptly closes when the water tries to flow in the opposite direction. Hence, Fleming called the invention, as he applied it, an "oscillation valve." This oscillation valve of Fleming's soon displaced all other detectors of electric waves.

Then came the wonderful improvement invented by Lee De Forest. He conceived the idea of controlling the electrons that streamed over from the filament to the plate. His means of control was simply a wire grid mounted between the filament and the plate, a grid which formed part of an electric circuit. When the grid was electrified negatively just a little, the electrons were correspondingly impeded in their onward rush toward the plate. On the other hand, when the grid was positively electrified to a greater or lesser degree, the electrons were assisted in their effort to reach the plate; indeed, they were literally pulled over. The grid might thus be negatively or positively charged millions of times in a second, but the electrons responded instantly.

Here was a marvelously sensitive method of control. The "three-electrode valve," as it came to be technically called, or the "vacuum tube" in popular parlance, proved to be an extraordinarily sensitive detector of electric waves. More than that, it proved to be also a means of amplifying exceedingly feeble signals. Tube could be added to tube, it was found, so that the signal detected by one could be magnified by a second, that of the second by a third, and so on, until at last an effect was obtained which might well be billions of times more powerful than that originally de-

LIPPINCOTT BOOKS

THE CITY OF FIRE

By GRACE LIVINGSTON HILL

A man's heart is THE CITY OF FIRE which flames with love, hope, passion, heroism. Mrs. Hill has woven her tale with great skill. The characters are intensely human—a beautiful girl, a minister who is a man, a millionaire who is not, until—but wait, every page thrills with action. THE CITY OF FIRE is a springtime romance that will stir to life new thoughts and finer emotions. \$2.00

ELINOR GLYN'S MAN AND MAID

Examine These Two Helpful Books

Accountants' Reports

By WILLIAM H. BELL, M.G.S., C.P.A.

Member of the firm of Haskins and Sells,
New York, Certified Public Accountants.

IN this comprehensive work, Mr. Bell offers accountants, professional and private, authoritative information on the handling of the form, arrangement, and content of reports.

The author explains the importance of uniform practice in rendering reports as a means of insuring their clarity. Fifty statements reproduced in facsimile illustrate the application of the principles brought out in the text.

A Suggestion of the Contents

There are fifteen illustrations of balance sheets, other than consolidated statements. These are designed to solve the problems regarding forms which are commonly encountered in actual practice, directly or by close analogy. Sixteen profit and loss accounts follow. Methods of presenting operating facts, and the use of comparisons, percentages, and supporting schedules are clearly shown.

Four consolidated balance sheets, and three consolidated income statements are reproduced. The twelve remaining statements cover topics such as investment securities, depreciation, cash statements, journalization, and sales cost.

Published 1921, (3rd ed., 1921), 247 pages
(8 1/2 x 11"), flexible binding, price \$6.00.

Mathematics of Accounting and Finance

By SEYMOUR WALTON, C.P.A.

Formerly Dean, Walton School of Commerce

and H. A. FINNEY, Ph.B., C.P.A.

Professor of Accounting, Northwestern University

THIS work presents in a single volume an exceptionally clear explanation of all mathematics required in accounting and financial work.

It covers the principles thoroughly by completely worked out examples, and illustrates their application to everyday business problems.

Gives Methods of Practical Value

The first two chapters give methods of quick calculation. The authors then deal with the principles of arithmetic progressions, averages, and percentages, pointing out their value in handling accounting problems. The seven chapters following are devoted to the application of principles given in the first part to specific business situations.

The calculation of trade discounts, the keeping of partnership books, methods of computing goodwill, and the conversion of foreign exchange are all worked out. The use and value of logarithms in calculating interest, bond values, leaseholds, and depreciation are shown.

Published 1921, (3rd ed., 1922), 274 pages,
cloth binding, price \$4.00.

We will be glad to send both of these books, or either one of them, to you postpaid for five days' examination. Within that time of their receipt, you may remit the price as stated or return the books to us. Use the coupon below.

3-in-One

The High Quality Oil for Home and Office

Try 3-in-One for oiling typewriters, all office mechanisms, bicycles, guns, automatic tools, sewing machines, locks, hinges. For cleaning and polishing fine furniture—for making your own dustless dust-cloths and polish mop. For preventing rust or tarnish on gas ranges, stoves, bathroom fixtures, tools, knives.

Self-Shavers: Use 3-in-One on your razor blades before and after shaving and they won't "pull." Motorists: 3-in-One stops spring squeaks, oils any magneto just right, cleans and polishes car body and wind-shield. Ford owners: Try 3-in-One on the commutator—makes cranking much easier.

Sold at all good stores in 1-oz., 3-oz., and 8-oz. bottles, and 3-oz. Handy Oil Cans.

FREE Ask us to send you a liberal sample of 3-in-One Oil and Dictionary of Uses—both free.

RADIO'S MAGIC WAND (Continued)

MOUNTING THE PLATE ON THE SUPPORTING LEADS OVER THE GRID AND FILAMENT

tected. If a dying fly groans, its anguish would be expressed in a terrific wail. The tap of a lead pencil becomes the blow of a trip-hammer.

It is because a vacuum tube can thus detect and amplify extremely feeble currents that broadcasting has grown overnight into a means of communication the possibilities of which seem almost limitless. Radio, a phase of engineering so technical, so special in character that it interested only the electrically informed enthusiasts, has become the common property of millions who now listen to the news of the day, to opera, to the jokes of some famous music-hall comedian, to the sermons of a noted preacher, broadcasted through the ether of space in rippling electric waves which pass through brick walls and mountains as light passes through glass.

Even to radio engineers it still seems almost miraculous that an electric lamp, like that which shines upon many a desk, has but to be provided with a plate (curled in the form of a sheath-like cylinder) and a grid to produce effects of extraordinary magnitude.

Although the price of tubes, so essential in the reception of broadcasted entertainment, has been much reduced, experienced production engineers are bending every effort to devising methods of manufacture which are cheaper and more rapid. Although machines play a part in the major processes of manufacture, tubes are still largely made by hand. Indeed, the personal equation plays a far more important part in the making of vacuum tubes than of any other piece of electrical apparatus with which the public is familiar.

Merely the preparing and assembling of the filament and grid before they are mounted in the bulb involves fourteen distinct operations, and each of these fourteen operations in turn involves much skillful adjusting, bending, twisting, and joining. It is a comparatively easy matter to seal the leading-in wires of an ordinary lamp so that there shall be no air leakage; but the sealing-in of the leading-in wires of a vacuum tube is a far more complicated process. The sealing methods employed in lamp-

ELMCO

is the last word in SHIELDED radio receiving apparatus. The ELMCO Tuner, Type S-1, and Detector, Two Stage Amplifier, Type A-3 is the development of Elmco engineers after years of study to secure the highest receiving efficiency.

Showing Complete Receiving Set Elmco Tuner Type S-1, with Elmco Detector and Two Stage Amplifier, Type A-3

Price, Without Tubes, Phones or Batteries, \$100

The Elmco Tuner, Type S-1, is guaranteed to be free from body capacity in any degree. The circuits are inductively coupled and symmetrically designed, so that maximum efficiency is obtained when tuned to any specific wave length within the range of the set. The adjusting dials are so arranged that after each operation the tuning may be sharpened to a very fine degree. The design of the Tuner is such that one of the controlling knobs acts as a vernier adjustment to the others; this feature allows for a nicety of control, which permits the operator to clarify telephone speech with maximum ease. The Elmco cabinet is of solid mahogany, beautifully finished, and the proportions of the sets make them extremely attractive.

THE ELMCO Crystal Detector Set

Elmco Crystal Detector Set, complete with head phones, price \$28.00

is highly selective. Extra-sensitive crystal and head phones are furnished and the cabinet is of highly finished solid mahogany. The range of the Elmco Crystal Detector Set is between 20 and 25 miles. All ELMCO apparatus is guaranteed to be perfect in material, workmanship and performance. We are also in position to make quick shipments on all parts, such as condensers, vacuum tube sockets and Rheostats.

INDIANAPOLIS, INDIANA

RADIO'S MAGIC WAND

(Continued)

making are not adequate in this process; the precautions taken to prevent the leakage of air into the tube must be more refined. Again, the preparation of the leading-in wires themselves is an operation that must be most delicate and precise. They are die-cut by hand, and some of them must be bent with the utmost care.

Equally difficult is the fashioning of the filament which, when it glows, shoots out electrons. The filament is a tungsten wire as fine as a human hair. Variations in diameter of even a few ten-thousandths of an inch cannot be permitted. The filaments must be exactly uniform in size and shape. The mere matter of cutting the filaments to the proper length is important. If the filament is five per cent short, for instance, the life of the tube may be reduced by one-half.

The grid must be wound around its support and welded into place. Because this is a machine operation it will be assumed at once that it is easy. It is anything but that. Uniformity of shape is essential. The operator of the welding machine must have acquired the knack of applying uniform pressure, because this is essential in securing a perfect weld. It sometimes takes two weeks or more to adjust the welder properly. It is the function of the welder to heat, and the heat is electrically obtained. Too much current will melt the wires of the grid; too little will not produce a good weld. Only long experience can dictate just what the amount of current should be.

Next comes the formation of the plate, so called—in reality, a cylinder surrounding the grid and filament. It is punched from sheets of nickel or molybdenum. Like the grid, it must be welded to its supports, an operation which, as we have seen, is almost a fine art.

The last operation, which consists in "anchoring" the filament in place, is one of the finer points of the process. It involves much calculation and thought; for the filament must be held firmly in place and yet it must have sufficient play to allow for its expansion when heated.

When the elements of the vacuum tube (the filament, the grid, and the plate) are assembled and then mounted in the bulb, the process of exhaustion must be carried out. The more air removed from the bulb, the more efficient the tube; for we have seen how easy it is for an atom of air to block electrons rushing from the filament toward the plate. The tube is exhausted by a pump which was developed in the research laboratories of the General Electric Company, and which is the most perfect instrument of the type yet invented.

Quantity production of tubes by machine must ultimately come in order that the insistent demand of the public may be satisfied. But quantity production in the automobile sense is at present impossible, simply because vacuum tubes, like fine chronometers, are still made by hand.

OLIVER

Warning:

This is the last appearance of this offer. It is your only opportunity.

This Offer Expires July 1st

To all who have been planning to buy a typewriter, we make this special announcement—up to July 1st you can save \$45 on the famous \$100 Oliver, the price being \$55. After July 1st the price will be \$65. Prompt action saves you the extra \$10.

Total Saving, \$45

This offer is made by the Oliver Typewriter Company itself. You get a brand new Standard Oliver, Model Nine, direct from the factory, not second-hand, not rebuilt. It is the identical Oliver long priced at \$100. Over 950,000 have been sold to satisfied users the world over.

SEND NO MONEY

Just mail the coupon and we send you an Oliver for Five Days' Free Trial. If you want to buy it, pay \$3 after trial, then \$4 per month. If you don't want it, ship it back at our expense. By dealing direct with the factory you save the usual selling cost. Sending the coupon does not obligate you to buy. We leave the decision to you, after the Oliver arrives.

Mail the Coupon NOW

Note that the coupon is valid only until midnight, June 30th. After that the price will be \$65. So act quickly. Mail the coupon now and get the Free Trial Oliver. You do not assume the slightest risk. The Oliver must sell itself.

TEACHER with home on Outlook will take pupils to board for summer. 1, Outlook.

SUPPOSE IT WERE YOUR BOY—

A REQUEST THAT READERS OF THE OUTLOOK JOIN IN THIS PATRIOTIC AND HELPFUL SERVICE

WHEN the sailor lads of America pour out from the great warships upon the bewildering streets of the city of New York, how shall they be met? Where shall they go? If one of them were your son, would you not cry out passionately—"Place him under the influence of good people and a good home?"

WHAT THE BOYS NEED

What to do with the enlisted men of the Navy on shore leave is a serious question. Without some objective of the nature of home or club they are likely to drift into mischief or worse. These boys crave decent surroundings and pleasures. They need to be assured of some sort of a place with good clean beds, baths, music, and diversions of the kind that are wholesome and attractive. The lack of a "home base" gives them a "lonesome feeling" and that is why you frequently find them haunting the street corners and seeking distraction with questionable companions in questionable resorts.

IT IS PRECISELY THIS HOME BASE WHICH THE NATIONAL NAVY CLUB SUPPLIES

The National Navy Club of New York, situated at 15 East 41st Street, has a three-fold mission. It acts for the enlisted Navy or Marine man on shore leave as:

A home where he is not only made to *feel* at home, but where every influence urges him to behave as if he were in his own home.

A hotel which does not cold-shoulder the sailor boy because he is a sailor boy; which is fully equipped with every adjunct to comfort; where the rates are nominal, neither beyond his reach nor on the other hand suggestive of charity.

A home club in the best and most constructive sense.

SOME FIGURES THAT SHED LIGHT ON THE NAVY CLUB'S ACTIVITIES

Foreign navies utilizing the club.....	19
Number of states represented.....	49
Average daily canteen attendance.....	250
Average number of men securing sleeping quarters.....	120
Present sleeping capacity.....	140
Average number of wounded soldiers entertained per month	750

The club has operated continuously since July, 1917, and during the year 1921, 25,000 were furnished sleeping accommodations and 30,000 meals were served in the club canteen.

The club's physical equipment consists of reading, writing and lounge room, library, billiard room, mail and check room, bedrooms and dormitories.

The canteen, directed by a volunteer committee of ladies, serves the best of home-cooked food at cost.

One of the most important departments of the Club is its mail and check room, open day and night, where thousands of letters are received and held or forwarded on request.

ADMIRAL PLUNKETT WRITES—

Rear Admiral Plunkett of the Naval War College writes: "On the ship, we are one family, officers and men, if the ship goes down we go down together. When our men get liberty ashore, we have to trust you people of New York to see to it that there shall be a clean, decent place for the men to go."

This is not a work for a few—each citizen has a responsibility to see that these boys have a home on shore to go to. We realized the necessity during the war. It is greater now because all other clubs are closed.

FUNDS ARE URGENTLY NEEDED FOR CONTINUING THIS WORK

Although the Club is not a charity, it is manifestly not self-supporting. At the rates charged, the members and lodgers pay less than one-third of the maintenance budget. The balance must be raised through corporate membership dues. Every enlisted man in the American Navy comes into the port of New York during his term of service. The Navy Club is therefore a national institution.

Will you join us in this patriotic and forward-looking service? Your subscription on the appended blank will be a vote for decency and clean American manhood.

BY THE WAY

THE fashion of anonymity in book-making seems to have had its day. The earliest printers not only left out their names but even omitted to date their books, and one of the most famous of novelists, Sir Walter Scott, it will be remembered, carefully concealed his identity for years after his first novel became famous. But the pendulum now swings the other way, in the spirit of the saying, "Credit to whom credit is due," and an American publisher, Alfred A. Knopf, is completing the reaction by printing not only his own and the author's name on his books, but also those of the printer, the binder, and the paper-maker. A general adoption of this sensible practice would lead not only to good feeling on the part of these collaborators in book-making, but to their emulation in making a product worthy of bearing a personal credit.

Much of the fine work issued by American publishers—and fine work is being done by them in spite of a general falling off in the quality of paper and presswork as a result of the war—has been due to men who have endeavored to put individuality into American typography—men such as D. B. Updike of the Merrymount Press, William Dana Orcutt of the Plimpton Press, Bruce Rogers of the Riverside Press, and the Goudys of Forest Hill, Long Island. To these names might be added those of such thoroughly workmanlike printers as De Vinne of New York and Munder of Baltimore. With the readjustment of industrial conditions anticipated in the long period of peace that seems before us, book-making will no doubt become a finer art than ever.

A request made to a travel bureau for information about the Czechoslovak Republic brought to our desk, together with other pamphlets, a copy of the Czechoslovak Constitution, printed in English in the city of Prague. Some of the paragraphs are novel and interesting. For instance:

Privileges due to sex, birth, or occupation shall not be recognized.

Inviolability of matter intrusted to the mails is guaranteed.

Public instruction shall be given so as not to be in conflict with the results of scientific investigation.

Wedlock, family, and motherhood shall be under the special protection of the law.

Only such titles may be conferred as designate official rank or a profession.

Every manner whatsoever of forcible denationalization is prohibited.

The second paragraph and the last were probably inspired by the autocratic methods of the former Austrian régime.

"Prince Wixzizwyxard, of the house of Challourglezilezisc of Ethiopia," the "Battle Creek Idea" says in a paragraph which one fancies is going to be humorous but which turns out to be deadly serious, "is visiting here and made the

The Name is Fitting

THE new Royal has all the refinements that would be expected of an aristocrat of typewriters. Its title has been earned, not inherited. It is self-made. Though mute, its actions are unmistakably those of a thoroughbred. It can't help being somewhat exclusive, for masterly craftsmanship has given it true distinction.

There's a poise and dignity in the outward appearance of the new Royal that bespeak a fine character within. The cleanness and uniformity of its typing unconsciously suggest good taste, discrimination. Its marked quietness makes it a good companion for concentration. It has a respect for the feelings of others.

The Light-Running, Quiet-Running Royal combines the strength and durability of a fine machine with the responsiveness and accuracy of an instrument—the achievement that makes its name so fitting.

Our fifty-six page book, "The Evolution of the Typewriter", beautifully illustrated in color, will be mailed free on request. Address Department O.

BY THE WAY (Continued)

following statement to students: 'You young people are allowed to get married before your best judgment has developed, hence so many divorces. The youth of Ethiopia are not allowed to marry until the girls are twenty-three and have been prepared for housekeeping and motherhood. The young men must be twenty-six, own a home, and be prepared to care for a family. As a result we have had only two divorces in 105 years.' Ethiopia is commonly used as another name for Abyssinia, and as a reliable authority says of the Abyssinians that among them "marriage is a very slight tie, which can be dissolved at any time by either husband or wife," the quotation from Prince — may be a joke after all.

General von Ludendorff, in an article in the "Atlantic Monthly" on "The American Effort," pays this tribute to the American boys in khaki who destroyed the morale of the German troops in 1918: "It is fascinating to read the dramatic account of the Frenchman, Pierrefeu, describing what an almost

supernatural impression that splendid youth from across the seas, those beardless boys of twenty, abounding in vigor and health, completely newly equipped, made on the emaciated, hollow-eyed French in their torn and threadbare uniforms. Both divisions stopped the German advance by their brave and sacrificing behavior."

Everybody knows the baffling quotations which seem familiar but which cannot be found in the reference books. Here is one which a subscriber asks our readers to "tag" with the author's name and the book in which its companion lines may be found:

There is a light about to break,
There is a fount about to spring.
Men of thought, men of action, clear
the way!

A notice to ship masters printed in the columns of the New York "Herald" (lineal descendant of the meticulous "Sun") contains this sentence: "It is important that these reports should be sent promptly at noon each day in order that they will be received in time for publication."

"With Love—Bob"

So little to do so much.
Just a box of flowers
and three short words.
Just a minute or two
spared by a busy man
from a busy day. But
a golden deed, for it has
made two loving hearts
rich in happiness.

There can be no real
happiness for those
who hold you dear that
you are not partner to.
There can be no sorrow
so deep that you cannot
soften it, if you
show that you care.
Say it with flowers so
that those you love will
know.

Your Florist will be glad to aid
in the selections of floral tokens
appropriate for every
occasion,—weddings,
birthdays, wedding anniversaries.

"Say it with Flowers"
Flowers may be telegraphed to all parts of the United States and Canada and delivered in a few hours through the Florist Telegraph Delivery Service.

Tarvia transforms old fashioned mud roads into all-year mudless, dustless highways—

PRESIDENT HARDING recently declared that the problem of distribution "is one of the greatest economic problems, if not the greatest problem, of modern civilization."

When we realize that it costs from four to ten times as much to haul a ton of goods over bad roads as it does over good roads, we see at once how vital this road problem is to all of us.

The question no longer should be, "Shall we have good roads?" It should be, instead, "How quickly and how cheaply can we get good roads?"

The Road Commissioners of hundreds of towns and rural districts throughout the country have found from experience that Tarvia pavements are the most economical good roads it is possible to build.

In first cost a Tarvia road is only slightly more than plain waterbound macadam. The upkeep of Tarvia pavement is, all things considered, so much less than that of any other type of lasting road that the saving—over a short period of years—will offset the original cost of construction.

Properly looked after, there is no limit to the life of a Tarvia road. With regular, but inexpensive maintenance, it is actually improved by time and traffic. Its easy-traction surface is smooth, firm, dustless and mudless all the year round—year after year.

Tarvia also offers an economical means of resurfacing old worn-out macadam, and of repairing and maintaining improved streets and highways of every kind. There is a grade of Tarvia for each of these purposes.

Tarvia

THE MAIL BAG

THE POETS' CORNER

I—BILL ADAMS SAYS HE IS ALSO A POET

OBSERVING a letter by a person by name of C. G. Arnold in your esteemed paper, May 17, I desire to state that last year The Outlook published some verses of mine—therefore they must have been a poem—therefore I must be a poet. I will not mention any of a dozen others I have sold.

Will you please advise said Arnold that if he will let me see his doggone dog I will guarantee to steal it from him. Also I ain't got long hair, I am bald. Also I keep my money in an old sock tied to my neck by a bit of string. Also I live in a house I builded myself with a hammer and some nails and pieces of wood.

Also I am six foot coming three; weigh 195 pounds except after meals, when I weigh 210, and will bet him I can knock him out in one round if he will come out here.

I wish you should publish the above, as if you don't he won't get a chance to hide when I get my business settled and start to his mudhole in Illinois to clean up on him, anyway, and I ain't ripe to hang yet.

BILL ADAMS.

Lindsay, California.

II—"I AM A POET MYSELF"

I DON'T think Mr. C. G. Arnold had ought to have said the things he did about poets in your magazine—about setting dogs on them and throwing them downstairs and their composition being worth about 30 cents. Humph!

I am a poet myself, and I wear my hair long because I am a woman, and also I have the price of a hair-cut if I wanted my hair bobbed, which I don't, being fifty years old and not wanting to look sixteen, and wild.

I sent a poem myself to Mr. Pulsifer not long ago, and the only reason it came back was that the magazine didn't need it just then, but they said that didn't mean that it wasn't a good poem. The title was "Little Irritations of Life." I still have it, and later on, when they need it, I shall send it again.

Besides I do *not* live in a garret. I live all over the house, and I am not thin and skinny. I am quite short and weigh 160 pounds, and my diet is the very best money can buy.

I think Mr. Arnold, of Chicago, owes us an apology in the columns of The Outlook.

H. H.

Battle Creek, Michigan.

THE BRITISH IN EGYPT

ON returning from a visit to Egypt, I was interested in an article on that country published in your issue of April 19, in which Dr. Collins was quoted as saying that the Egyptians are anxious for the termination of the British protectorate.

It is true that there is much unrest, but when I asked an educated native to explain it, the principal reason he could

give was that the English seemed to maintain the attitude, "We are the governors, you are the governed," and it was irritating; perhaps there are some in our own possessions who feel the same about us.

However, there are other things to be considered. For instance, I was in a party of tourists one of which was a woman seventy-four years of age. This woman mounted one of the many camels at the Pyramids and found that the driver walking by her side had led her a bit away; next he reached up and pinched her ankles till she had to promise more money. Later, while sitting in the sand with a friend, she took out her pocketbook to pay for a purchase, and almost instantly was knocked over, her friend also. In a moment an alert British mounted policeman was on the scene, rescuing the women and arresting their assailants. Other tourists told of accepting casual invitations that resulted in hold-ups. Every hotel warns guests against guides without recommendations. El Azhar, the famous Moslem university of Cairo, with its hide-bound conservatism and its narrow courses, can hardly fit its many thousands of students for active thought and modern problems.

One honors the Egyptian for his efforts toward self-development, but for the present visitors and all who have any stake in that country will feel much greater security if England makes her recession somewhat gradual—at least till the native has reached a state of development not attained at a single bound.

FRANCES M. SHERRY.

Troy, New York,
May 22, 1922.

A BOUQUET AND A BRICKBAT

ALLOW, please, a very old and very grateful friend of The Outlook to offer his congratulations on the number of the paper for April 12 which you have given us.

I had a few days ago a letter from a friend in equatorial Africa to whom for many years I have sent The Outlook regularly.

He writes: "No paper gives me and my wife the world news that we need so admirably, so succinctly put as does our Outlook. We value it increasingly. . . . It is good to read, good to remember."

W. S. RAINSFORD.

Ridgefield, Connecticut.

II

YEARS ago, when nothing was being done for child welfare, earnest folk got together to start as simple a movement as they could toward enlightening the average or below average parent about the condition of his child. Good medical advice and good mass psychology evolved the height and weight according to age system. That has done more to improve babies in the United

States than any other one thing. You know, and I know, that it is not an absolute standard of health.

I feel that your recently published article "The Great Under-Weight Delusion" is harmful. It is a hit at a standard that is doing good. The exceptional child who is under height or weight and is normal should be shown to a physician, who can explain to that particular parent the exception. But the average parent should not be able to say: "My child is so-called under height or weight, but I don't pay any attention to that. The Outlook calls that a delusion."

My dear Outlook, political issues are one thing; but undermining health education programmes for nations is another.

HARRIETTE C. GAYLORD.

Sodus, New York.

PODUNK IS

I WAS greatly interested in Fullerton Waldo's discussion of "The Fair Name of a City" as presented in a recent number of your valuable magazine. I was, however, surprised and pained at his denial of the existence of the widely famed "Podunk." Speaking of the indignant protests of the citizens of the various cities which he named, he adds: "During all these years of badinage there has been no murmur of remonstrance from Podunk, since there is no such place as Podunk. (See Lippincott's Gazetteer.)"

Now, Waldo and Lippincott to the contrary, notwithstanding, there is such a place as Podunk. I have been there many a time. It is a pleasant rural community in a lovely valley in north-eastern Hector within the recently much advertised Finger Lake region of central New York.

Hector is the southwest township of the "Military Tract" which New York State subdivided into 600-acre lots, giving 450 of these acres each to her Revolutionary soldiers, as a sort of "bonus" or pension. This tract extended from Lake Ontario southward to a line drawn through the head of Seneca Lake and westward to the Pre-emption Line, which coincided nearly with the course of said lake. It embraced, in whole, or in part, ten counties which now include the cities of Oswego, Syracuse, Ithaca, and Auburn.

At its southwest corner Hector joins on Watkins, with its noted Glen, and thence stretches ten miles northward along the east shore of the rarely freezing Seneca. To the eastward it rises gradually five miles to its "backbone," and thence slopes another five towards "Cayuga's waters with their waves of blue," as Cornell students sing at Ithaca. It is on this slope that Podunk Valley lies smiling to the morning sun.

The origin of the name is lost in the mists of antiquity. By analogy, however, it doubtless, like Oshkosh, Sheboygan, Kankakee, and Skaneateles, was the name of an Indian warrior—some Iroquois chieftain who hunted in the

forest, fished in the lake, or fought in tribal warfare while his squaw planted the maize, tended the garden, and nursed his papooses when they were not swinging in the wind rock-a-by.

Incidentally, it might be mentioned that Hector has a fame of her own. Her town Temperance Society is the oldest in the world, and the term picnic originated in her borders, a hundred years ago, when her first Sunday school "picked" up their "knickknacks" for an outing by the lake.

Why, indeed, should the citizens of Podunk murmur at the badinage of its name? Rather should they not be proud of the Nation-wide fame that is theirs as inheritors of the cognomen of a great chieftain in a powerful confederacy of the Red Men.

But henceforth let no one deny the existence of Podunk. For Podunk is.

X.

THE PUSH OF LA PUSH

IN a recent issue you refer to the timber resources of Alaska and mention the present shortage of print paper. On January 29, 1921, a tornado swept the western part of Jefferson and Clallam Counties in the State of Washington, blowing down eight billion feet (board measure) of timber. These figures are taken from the National Forest Service report. Of this fallen timber, fully one-half is spruce and hemlock; both of these timbers are fit for print paper. In about four years this down spruce and hemlock will so deteriorate that they will be unfit for paper or lumber. At the present price of pulp wood at the pulp mill (\$15 per cord), this fallen pulp timber is worth approximately \$60,000,000. In this estimate I have not considered the value of the down fir or cedar. The down fir and cedar will not rot as soon as the spruce and hemlock; but the longer the fir and cedar are down, the less they are worth for lumber or shingles. As near as I can learn, it is the policy of both the State and National Governments to let this vast timber wealth rot. To date no steps have been taken to salvage this blown-down timber. All the effort so far has been to prevent forest fires. While the fire hazard is worthy of the most careful attention, and while we are carefully watching the fire hazard, I feel that from one to two hundred million dollars' worth of timber should not be allowed to rot. Especially is this true when one considers that print paper is so scarce that many of the rural papers have gone out of business. Under the laws of the State of Washington, in a district where a harbor can be made or improved a port district may be formed and bonds issued for such port improvement. We in the western part of Clallam County are now trying to form such a port district and bond ourselves for the purpose of making a harbor at La Push, at the mouth of the Quillayute River. With a harbor there, the most of this blown-down timber can be floated to market on the many rivers that empty into the ocean at La

Messrs. Harper & Brothers have the honor to announce that on June 1st, 1922, they published a new novel by

Margaret Deland

Author of "The Awakening of Helena Richie," "The Iron Woman," etc.

The title of this new novel, the first to be written by Mrs. Deland in several years, is

(Continued)

Push. A harbor at La Push will also be a harbor of refuge that is badly needed at this point. There have been three nasty wrecks on the west coast of Clallam County since I came here where nearly every one aboard perished. This is one of the biggest undertakings that has ever been attempted by so small a community, yet, when you consider eight billion feet of timber down and about thirty-two billion feet standing, the majority of which is overripe, it is not so much compared with our vast timber wealth. A saving of approximately three dollars per thousand will be made if this timber is floated to market over taking it to market by rail. A small part of this saving will pay for all the harbor improvement at La Push. This district comprises one of the largest bodies of virgin timber that remains untouched by the logger that is left in the United States. The Olympic forest reserve is in this district, and much of this reserve timber is overripe and should be cut. We feel that the National Government should help our enterprise. We feel that it is worthy of National consideration both as a market for their overripe timber and as a harbor of refuge. A large part of the Government timber can be floated to market on the rivers that have their source in the Olympic Mountains.

FRANK M. ACKERLY.

Forks, Washington.

THE UNBOSSSED FLOWER

IN a little cottage surrounded by shrubs and trees, flowers here and there to cheer, sat a little old lady. She had lived the active life of the twentieth century, had traveled far and wide, and kept clear, through all, her power to think. The younger generation never said, "Your point of view is of years gone by, out of date, out of fashion." Instead, they came ever to her to untangle their tangle; either mother or father would not or could not see, could not or would not understand. The gate latch clicked many times a day. Her visitors were from the restless world, old and young seeking, ever seeking rest—repose.

Flowers were her passion. A maid typical of the age was dusting. On the table was a vase filled with lavender baby chrysanthemums tied with a delicate blue bow of paper ribbon. One flower hung down; the maid put it in place, it dropped again, the maid put it again in place, it again dropped.

The little old lady smiled and softly said, "The little flower seems not to wish to mind."

The maid in none too gentle voice replied: "I am glad of it; it has a mind of its own, it's not going to be bossed all the time."

The spirit of the age—"I won't be bossed. I won't stay in place, I won't follow a leader. I'll be independent, even if I don't know as much."

The flower dropped lower and lower

until it no longer seemed to belong to the lovely bunch; its stem broke, water no longer could refresh it, it became a useless thing, dead. The other flowers were in their assigned place, fresh and beautiful, giving joy to all who passed by.

Why are many of the age blind to the need of the worthy leader, the need of standing up in place ready to pull together and add to the world's joy? It's in answering the captain's "Now, all together, boys," that wins the race, not the "I won't be bossed."

These were the thoughts of the little old lady as she heard again her latch gate.

L. A. G.

APPRECIATION FROM GIGGLESWICK

THAT simply delicious article in The Outlook some weeks ago by Lewis Edwin Theiss yclept "What Life in the Country Has Taught Me About Religion" immediately recalled to me the following excerpt from George Eliot's "Adam Bede," which I believe will right interest your readers:

"Nay, Seth, lad; I'm not for laughing at no man's religion. Let 'em follow their consciences, that's all. Only I think it 'ud be better if their consciences 'ud let them stay quiet i' the church—there's a deal to be learnt there. And there's such a thing as being over-spiritual; we must have something beside Gospel i' this world. Look at the canals, an' th' aqueducts, an' th' coal-pit engines, and Arkwright's mills there at Cromford; a man must learn summat beside Gospel to make them things, I reckon. But t' hear some o' them preachers, you'd think as a man must be doing nothing all's life but shutting eyes, and looking what's a-going on inside him. I know a man must have the love o' God in his soul, and the Bible's God's word. But what does the Bible say? Why, it says as God put his sperrit into the workman as built the tabernacle, to make him do all the carved work and things as wanted a nice hand. And this is my way of looking at it: there's the sperrit o' God in all things and all times—week-days as well as Sunday—and i' the great works and inventions, and i' the figuring and the mechanics. And God helps us with our head-pieces and our hands as well as with our souls; and if a man does bits o' jobs out o' working hours—builds a oven for 's wife to save her from going to the bakehouse, or scrats at his bit o' garden and makes two potatoes grow instead o' one, he's doing more good, and he's just as near to God, as if he was running after some preacher and a-praying and a-groaning."

His (Adam's) work had always been part of his religion, and from very early days he saw clearly that good carpentry was God's will—was that form of God's will that most immediately concerned him.

CONTRIBUTORS' GALLERY

(C) Harris & Ewing

JAMES J. DAVIS, the present United States Secretary of Labor, is a Welshman by birth. He came to this country with his family at an early age and began his life in America as puddler in the Pennsylvania steel mills. He

soon rose to the position of boss puddler and became active in the Steel Workers' Union. He is President of the Loyal Order of Moose. The pen-and-ink sketch accompanying the article was made by a neighbor of the Davis family.

ANGELA M. KEYES is head of the English Department of the Brooklyn Training School for Teachers, and, serving in such a capacity, is in a position to write authoritatively on the type of girl that makes the best instructor. She is also principal of a night high school and is the author of several text-books and a book on "Story Telling."

INTER-COLLEGIATE ATHLETICS.—Additional fourth-prize letters appear in this issue. Such signatures as appear in italics are pen-names. These prize-winning letters come from students in Iowa State College, Oberlin College, Columbia University, and from a cautious collegian in Pennsylvania who wishes even the name of his Alma Mater to be withheld.

D. L. EMMETT HOLT, who continues the discussion on "the under-weight delusion," is one of the most distinguished authorities on the physiology, pathology, and nutrition of children. He is a graduate of the University of Rochester and of the College of Physicians and Surgeons in New York City, and holds honorary degrees from various institutions. He is a professor in more than one medical institution of distinction, and is a member of various medical associations and research societies. He has written authoritatively on the care and feeding of children.

THE ANONYMOUS BANKER

WHILE he is not contributing to this issue, it may not be inappropriate to say here that he is preparing for The Outlook a group of sketches on five different types of Americans like those which we published in the issue of May 10 and which excited such general interest that the "Literary Digest" has asked and received our permission to reproduce them as a kind of illumination on current life. The groups of sketches which will appear from the Anonymous Banker's pencil from time to time during the summer will include children, stock brokers, country-club members, and subway travelers. Watch the Anonymous Banker. He is not only a clever artist, but a penetrating psychologist.

SELF-CONTROLLED STRIKERS

FOR nearly twenty weeks there has been a state of industrial war in the Pawtuxet Valley of Rhode Island. The combatants are, on the one side, the textile workers and, on the other side, the managers of the textile mills. Neither side has been willing as yet to admit defeat, or willing apparently to reach a "peace without victory." Yet the country at large has virtually forgotten—if it ever knew—that such a great strike was in existence.

It is not merely in one State that this state of industrial war now exists. It has been extended into Massachusetts and New Hampshire, and affects practically the whole cotton-manufacturing industry of New England. That the Nation has not been aroused by this strike is due, not to the fact that it is local—for it is not—but to the way in which it has been carried on.

Mr. J. H. Hayes, assistant to The Outlook's Industrial Correspondent, Mr. Sherman Rogers, has been observing conditions in the Pawtuxet Valley. "It is difficult for the casual observer," he writes to The Outlook, "to realize that there is a strike in progress. Unless one attends a meeting of the strikers, or happens to pass by one of the 'soup kitchens' or 'restaurants' at meal time, or chance to glance toward a mill and notice the entire absence of noise which usually attends its operation—for there are only three mills in the valley which are operating, and they have reduced forces—there is no outward evidence discernible of a strike. Since the first two weeks of the strike there has been no violence."

Though they are without ready cash, the strikers, Mr. Hayes reports, do not seem to be worrying a great deal as to when they will return to work. In the villages of the valley there are thirteen restaurants maintained by the unions, and there the strikers can get good, wholesome food twice daily. Besides the restaurants there are shoe repair shops for the benefit of the strikers. Both the restaurants and the cobbleries are the product of the Amalgamated Textile Workers of America. This is the more radical of the two general unions in the textile industry of America. The more conservative union is the United Textile Workers. The Amalgamated "covers" the Pawtuxet Valley, while the United "covers" the Blackstone Valley. The United is affiliated

with the American Federation of Labor, while the Amalgamated is independent.

As in the cobbleries and in other activities of the union for the benefit of the strikers, the attendants in the eating-places are themselves strikers who volunteer their services.

CO-OPERATION IN AND AFTER THE STRIKE

"I HAD lunch in one of the 'kitchens,'" writes Mr. Hayes, "and I was served with a generous helping of probably the most wholesome and nourishing food obtainable—Boston baked beans, with plenty of good bread and butter, hot coffee, and a pickle relish—and what I had was simply a regular order; nothing fancy, to be sure, and no unnecessary expenditure of money for cake and pastry, but all the good solid food a person could eat. And I was merely one among six hundred who had their meal at this particular restaurant that day."

From 11:30 A.M. to 1:30 P.M. five thousand men, women, and children are fed, and again from 4:30 to 6:00 P.M., at a daily cost, according to the General Relief Chairman, of approximately 7½ cents per person.

In the evenings the strikers hold a dance in a large hall leased for the purpose as well as for use as general strike headquarters. It is situated in the village of Arctic, about as central a location as it is possible to find. "The music," says Mr. Hayes, "is not rendered by Paul Whiteman's Jazz Orchestra, but it answers very well for those who have never heard the Broadway 'musical' celebrity."

The money with which to carry on the strike is raised by collections made by strikers, chiefly girls, who visit the various mills in the territory contiguous to the valley. The most consistent and stable source of supply is found in Fall River, Massachusetts, to which as many as fifty or sixty girls journey each week to make their collections. Here also has been established a restaurant for the feeding of the collectors. By this means is saved the additional expense which would otherwise be necessarily incident to patronizing the local restaurants.

What most impressed Mr. Hayes on his visit was apparently the spirit of co-operation among the strikers. "Whether it is a question of collecting, feeding, entertaining, or what not—and there is much of that to be done—each one," writes Mr. Hayes, "seems to know the

part he plays and appears on the stage at the proper time, taking his cue and going ahead without further prompting." The organizers, sent into the territory by their New York office, merely address the mass-meeting and furnish such counsel as they are called upon to furnish; but the effectiveness of the organization, in Mr. Hayes's opinion, is due to the fact that the strikers have united in a common cause and realize the value of working together.

Walking through the valley and considering its peaceful condition, Mr. Hayes was led to marvel, he tells us, at the fact that here was under way a strike involving six thousand of its inhabitants directly, and indirectly approximately twenty thousand. In conclusion he writes to us:

"The strike has, naturally, been hard for all sides to bear, but when it is over and the workers have returned to the looms, I believe, both sides will appreciate the lessons it has taught. I imagine the manufacturers will recognize the fact that they have lost the contact which breeds confidence between the workers and the management, and they will endeavor to establish this most important requisite to efficient, one hundred per cent production. Without good contact between the workers and the management there can be no confidence between these two; without confidence there can be no understanding; and without understanding there can be no stabilized prosperity in industry; and so, I believe, the manufacturers will endeavor to establish this confidence which has long since been lost. On the other hand, I believe that the workers will remember the value of co-operation, of pulling together, and will pull together, not only among themselves, but with the management; realizing that good wages can only be paid them when they put the money with which to pay those good wages into the hands of the manufacturers through efficient, co-operative effort."

ACQUITTED OF TREASON

THE acquittal of William Blizard, indicted for treason against the State of West Virginia, was based on two grounds; one is rather technical, the other relates to the larger question of what treason is. It is necessary under the State Constitution in charges of treason to prove by the testimony of two witnesses that the accused committed an

overt act; now, the only overt act charged against Blizzard was that he was with the armed forces of the so-called invading union miners in Logan County, the only part of the State under the jurisdiction of the Court which tried Blizzard; the prosecution failed to show this; in fact, the only acts committed by Blizzard in Logan County seem to have been successful attempts to induce the marching miners to surrender to the Federal troops or disperse.

But it also seems certain that the State failed to show that treason had been committed. It is in this matter that the people of the country at large are most interested. Judge Wood, who presided at this trial, remarked:

Treason is an offense that differs from all other offenses in that it is an offense against the sovereignty of the State itself. It is a direct injury, or an attempt to commit a direct injury, to the Government of the State. In no sense is it an offense against an individual. I think the chief character of treason is that it is designed to subvert the government, either wholly or in part. And under our Constitution treason consists only in levying war against the State and in giving aid and comfort to its enemies.

This is undoubtedly sound modern legal doctrine. There was a time, under the old English practice, when charges of treason were sustained for absurdly minor offenses; thus it is said that in the reign of Edward IV an innkeeper whose sign was a crown and who jokingly remarked that he would make his own "heir to the crown" was drawn and quartered for treason. Such absurdities as this led to proper restriction of the legal definition of treason. In this country treason against the State is defined by State constitutions exactly as treason against the United States is defined in the Federal Constitution; that is, treason against the State consists of levying war against the State, adhering to its enemies or giving them aid and comfort. The only cases of trial for treason against a State, so far as we know, have been the prosecution of those engaged in the Shays rebellion in Massachusetts, (1786) and the cases that resulted from the Dorr rebellion in Rhode Island (1844). In recent times the only attempt of this sort, we believe, was the indictment, after the Homestead riots of 1892, of men belonging to the miners' Advisory Board on a charge of treason. If we remember rightly, these indictments were never tried. At the time *The Outlook* pointed out: "The Homestead riot, while a palpable violation of law, did not aim at the overthrow of the sovereignty of the State, and therefore lacked the 'treasonable intent' necessary to constitute treason."

Evidently the same general condition

was held to exist in the West Virginia prosecution. There may possibly be another attempt to sustain the charge of treason in the trial of some of the other men who have been indicted.

NO GOVERNMENT BY PRIVATE INTERESTS

SINCE the charge of treason fell through, the decision cannot be regarded as either upholding or refuting the contention of the defense that the activity of the union coal miners was not only not aimed against the State, but was designed to remedy a state of things in the non-union coal district which amounted to a subversion of the sovereignty of the State by the coal operators, aided by paid guards, hired gunmen, and deputy sheriffs who drew pay from the operators, as was admitted by the operators before and during the trial. What legal value such a contention would have is not certain. That it had some impression on the public is shown by the comments brought out by this trial. The New York "Tribune," for instance, quotes the testimony of Captain Wilson, a Federal officer who commanded the United States troops called out; he said that the so-called invading miners "were obsessed with the thought that the thugs from Logan were bent on destroying their homes and killing their women and children," and that they welcomed the coming of the Federal troops. Another New York journal, the "World," after discussing the acquittal, declares: "It is difficult to blame the union men who attempted to cross the line and restore the right of free speech and assembly in the community. Somebody ought to march on Logan; not a group of miners but the State authorities with power to remove unfit officials and put an end to oligarchy supported by gunmen."

Another, the "Herald," says:

The leaders of the union miners who marched against Logan and Mingo Counties were manifestly trying to take the law into their own hands. But the group of non-union coal operators, controlling the local government in the two counties, had already taken the law into their hands. They had established an embargo on the activities of union organizers and had denied workers in their mines the rights of free speech and free assembly guaranteed to all citizens by the State Constitution.

Apart from the legal aspects of the trial, the general impression made by the whole situation in West Virginia as thus brought out is that, while the mine-owners have the legal right to refuse to employ union men, the conditions of the mining industry in that section of the country are such that the authorities of

the State of West Virginia and of the counties in which the mines are situated should carry on government and enforce the law with respect to the right of free speech as well as the right of contract, and that, beyond all, they should not depute or allow to be deputed legal governmental functions to men paid by one of the parties to the labor controversy.

THE LAST OF THE GOOD BANDITS

THE phrase printed above is the title of a practical appraisal of the late Boies Penrose, Republican leader and United States Senator from Pennsylvania, which appeared from the pen of William Hard in a recent number of the "International." This practical estimate attributes the lack of certain moral standards in Penrose to the atmosphere of his time, but gives him credit for powerful virtues and a rugged strength. He took the psychology of his period as it was and adjusted himself to the mental habit of his generation. When he came out of Harvard and chose a career within the organized politics of his day, one of the first things he did was to learn to spit as far and as accurately as any ward heeler with whom he came in contact. He had no use for a professional lobbyist. He knew instinctively that a too influential lobby in legislative halls means a weak party organization. Where party leadership is failing, there the lobbyists drive a coach and four through party orderliness and dominance. Penrose believed in political support for particular business interests, but he wished it to be offered in line with what he regarded as sound party policy. He wanted the party organization to be the ruling force and not to be driven on by the lobby of the special interest. When a change in the charter of Philadelphia was contemplated in 1919, he gave utterance to a political maxim which party leadership everywhere would do well to ponder. He said that party efficiency increases in the exact ratio in which it disentangles itself from municipal affairs. This is an unwelcome view to the long line of political bosses who have made the spoils of the cities the rootage of their rule. But it is a sound view. The political party which in any State depends upon the control of the patronage and the contracts and the perquisites of the cities for its vitality soon falls into unstable equilibrium and ultimately into popular disrepute.

When he was twenty-six years old, Penrose laid down a principle of political philosophy which the country has not yet outgrown. "In formulating a government," said he, "we must calculate on the indifferent watchfulness of

the ordinary citizen in ordinary times." This was the corner-stone of the Penrose philosophy of government, and is still to be reckoned with by all men in public affairs. The practice of the direct primary and such other devices for the encouragement of popular action have, at divers times and in divers places, aroused greater watchfulness, but they have not by any means eliminated the indifference of the average citizen. There has been change enough, however, so that it is no longer safe for the party organization or the party leaders to lean towards the special-interest philosophy in public affairs, as Penrose did so long in Pennsylvania. We think Penrose himself recognized the change in his later *sub rosa* espousal of the Roosevelt leadership for the country. It is well known that if Roosevelt had lived Penrose would undoubtedly have supported him for President in 1920.

The Penrose philosophy of the need of a strong party organization and leadership to stabilize the alternating watchfulness and indifference of the average citizen is still sound. Politics and government are, and probably ever will be, the center of clashing interests. If party organization is weak, the more able and powerful of the clashing interests will occupy the driver's seat. If party organization is strong but corrupt or leaning towards a special-interest philosophy, the general welfare is sacrificed. But if party organization is strong and at the same time bent upon the public welfare, it can hold clashing interests in check and serve the common weal better than the vacillating indifference and watchfulness of the average citizen.

The Penrose philosophy and practice were half right and half wrong, but "the last of the good bandits" was headed towards the right when Roosevelt died, and was still headed in that direction at the time of his own death. This change in a typical Republican boss of the old school throws some light on the change in popular sentiment which led the Republicans of Pennsylvania to nominate Gifford Pinchot for Governor.

BIG PAY OR STEADY WORK?

WE have more than once referred to the remarkable success of what is known as the Cleveland Plan in bringing into fair relations work people and employers in the great garment industry of Cleveland, Ohio. A novel extension of the activity of those who are carrying out the plan has developed. It is an attempt to answer the question, How much does the assurance of steady employment mean to the average workman? Does he prefer a large pay envelope at the price of an uncertain work-

ing period, or a smaller envelope with the assurance of year-round employment?

Inquiry led to the belief that the best results in every way both for worker and employer should be obtained when steadiness of employment was assured. A proposal was therefore made to firms in the women's garment industry in Cleveland that they should be allowed to reduce wages by ten per cent, provided they would give assurance of forty-one weeks' employment during the year or its equivalent in wages. It is expected that the flow of labor during the next year will indicate whether it is the weekly wage or the annual earnings which the average worker takes most into consideration. The manufacturers who accept this idea must deposit in a guaranty fund twenty-five per cent of their total labor pay-roll each week. If they provide forty-one weeks' work, the fund reverts to the firm at the end of the year; otherwise, the workers can draw on it during the weeks of unemployment.

This plan of assurance of work or pay drawn from a centrally held fund has now been in operation for some time and is believed to be the only unemployment fund of the kind either in this country or abroad. It is notorious that the seasonal character of employment in the garment trade is the greatest cause of dispute between capitalists and workers. The new arrangement is a modification of something which has existed for a year.

Under the general provisions of the Cleveland Plan, the union and the manufacturers have not only done away with strikes by submitting their disputes to a board of impartial referees representing the public, but they are installing week work and scientific methods of manufacture. The union is co-operating, financially and otherwise, in this industrial experiment. In return for the increased production which has resulted, the manufacturers recognize it as their responsibility to give steady employment.

The problem as to seasonal work is of vital importance in other industries than that of the manufacture of clothing. Especially is this true of the coal-mining industry. One of the most serious issues in the present strike is the complaint of the miners that they cannot tell what any sum fixed for a day's work or week's work means unless there is some kind of probability as to the number of days or weeks they will actually have work provided for them during a year. The same thing is true as regards the building industry; and some other forms of employment. It is possible that this Cleveland experiment

may suggest a general remedy in this direction.

THE ORATORIO SOCIETY OF NEW YORK

AMONG the many "drives" for public financial support that have been carried on in the city of New York recently, one of the most deserving and yet one which is, we are afraid, likely to attract little public attention is that of the Oratorio Society. This old and respectable organization does not cure anybody of physical ills, nor feed the physically starving, nor promote scientific and industrial education, nor adopt orphans, nor send slum children on country vacations. But it has given joy and comfort and inspiration to thousands, and it is an important factor in furnishing that æsthetic nourishment of the mind without which no nation, however many factories and railways and mines it may possess, can develop a well-rounded and useful national life.

The Oratorio Society was founded in 1873 by Dr. Leopold Damrosch, the father of Walter Damrosch and of Frank Damrosch, whose great achievements in behalf of music are too well known to require any record here. It has had a remarkable musical history, as the distinguished critic Mr. H. E. Krehbiel has pointed out in a very interesting article on American choral music published in the New York "Tribune." Its fine chorus is composed, not only of accomplished amateurs, but also of professional church singers, and it has therefore contributed much to the fostering of a high quality of church music. Its programmes have been made, not merely of ecclesiastical music of the English oratorio type, but of modern pieces of such composers as Brahms, Richard Strauss, Gabriel Pierné, Wolf-Farrari, and Debussy. Although the society is fifty years old, it is the product of a still earlier musical development in America. In the "Tribune" article already referred to Mr. Krehbiel makes the following significant observation:

Music in all its forms, instrumental and vocal, choral and orchestral, has been intelligently cultivated in America much longer than is popularly supposed. The misconception is largely due to the attitude assumed by historical writers, which would seem to indicate that the first American colonists as well as the first citizens of the American Republic were barbarians in art, when as a matter of fact the founders of America were men of the finest culture, as appreciative of beauty as were the people from whose loins they sprang.

Mr. Krehbiel notes the interesting historical fact that on May 4, 1786, there was given in Philadelphia a concert at which two hundred and thirty singers

A WAR-TIME GROUP OF MUSICAL LEADERS

Right to left: Albert Stoessel, Director of the A. E. F. Band School at Chaumont, France; Andre Caplet, Conductor of Paris Opera; Francis Casadesus, Director of the American Conservatory at Fontainebleau, France; Jacques Pillois, celebrated French composer

and an orchestra of fifty instrumentalists performed portions of the "Messiah," and this most famous of all oratorios was given with a complete chorus and orchestra in New York a year before it reached Germany, in the last quarter of the eighteenth century. Handel, of course, went to England when he was twenty-five years of age, and lived there for fifty years, and the "Messiah" was composed and produced in that country and under English ecclesiastical influences.

Such are the antecedents and ancestry of the Oratorio Society. The members of its chorus give their services without pay, but the expenses of orchestra and soloists and concert halls is considerable. It is necessary to meet an expense budget of \$40,000 each season. The receipts from the sale of tickets is about \$15,000. The deficit has been made up by a very small group of generous men and women "whose love of music," says the prospectus of the Society, "and appreciation of the importance of the work have permitted them to do so." The Society now wisely feels that it ought not to depend upon two or three rich patrons, and it is asking a larger group to underwrite this deficit of \$25,000. All we can say is that those

who believe that one of the foundations of American culture is fine music in the church, in the school, and in the home, as well as on the operatic and concert stage, can do nothing better to substantiate their belief than by supporting such an organization as the Oratorio Society.

A NEW ORATORIO CONDUCTOR

THERE is another reason why the Oratorio Society deserves to command public attention at this time. It has a new conductor, and a rather remarkable one. We do not know of any American family in the profession of music which for a period of fifty years has more continuously stood for the highest standards in school, conservatory, and on the concert stage than the Damrosch family. The work of Dr. Leopold Damrosch has been carried on in a fine fashion by his sons, Walter and Frank, and his daughter, Mrs. David Mannes. Walter Damrosch is the latest member of his distinguished family to conduct the work and performances of the Oratorio Society, but his labors in other fields of music, as, for example, conductor of the New York Symphony Society, have so greatly grown that it was necessary for him to lay down the oratorio baton. He

did this by first selecting an assistant and then recommending that the assistant become his successor.

This successor is Albert Stoessel, a native of St. Louis, Missouri. He is a violinist by profession and had achieved considerable repute as a very young man. After studying and performing in Europe, when the Great War broke out he returned to this country, and when America entered the war enlisted in the 301st Infantry, going to the French front as an infantry lieutenant. One of the modern features of the European War was that great emphasis was laid upon the importance of the regimental military bands. These bands cheered and inspired the fighting men in such a way that the men themselves asked that the bandsmen be removed from the danger line. Lieutenant Stoessel became the leader of the excellent band of the 301st Infantry, numbering eighty-five men, and from this moment attracted attention as a conductor. General Pershing so appreciated the value of music in war that he called Walter Damrosch from this country to general headquarters to discuss the matter and to form a scheme by which the American military bands could be co-ordinated and trained. One of the first things Mr. Damrosch did was to take the bandsmen out of the front lines, where they served not as combatants but as stretcher-bearers, and this was heartily approved by the fighting men. The next thing he did was to found a school for bandmasters at Chaumont; and of this school Albert Stoessel became the head, at the place where Mr. Damrosch first made his acquaintance.

At the conclusion of the war Mr. Damrosch invited Mr. Stoessel to become his assistant, and he has now become his successor. In the brief time that Mr. Stoessel has been out of the military service he has re-established himself as a violin soloist, and he is also making a reputation as a conductor and a composer. He has just finished his first season in directing the Oratorio Society, and it has proved successful. The combination of Mars and the Muses which Mr. Stoessel personifies lends an interesting touch of romance to the new period on which the Oratorio Society is entering. We wish it success not only as a useful representative of the fine arts but in its commendable work to get the music-loving public to relieve it of a financial burden which must inevitably, unless taken off its shoulders, hamper its free development. In the old days princes enabled great musicians and choirs and orchestras to live. A duke and a prince were the patrons and supporters of Bach. In a democracy the people must not only perform the political services of the old aristocrats but

must take upon themselves the ducal and princely functions with regard to art.

THE IROQUOIS AND THE HAGUE TRIBUNAL

DEMANDING facilities for higher education, radical improvements in the primary schools now provided for them, recognition as a sovereign and independent people, and guaranties against further invasion of their lands by Canadian authorities, the Six Nations Council of Iroquois chiefs, in session at Ohsweken, Ontario, we learn from a correspondent in London, Ontario, Verne De Witt Rowell, recently decided to appeal to the International Court of Justice at The Hague against their treatment by the Dominion Government.

Their decision indicates in a striking way the implicit faith that the "little nations" of the earth repose in the international arbitration idea, for the Iroquois tribes in Canada hardly total, all told, 10,000 men, women, and children.

Comprising six separate tribes, Tuscaroras, Oneidas, Mohawks, Senecas, Onondagas, and Cayugas, the Six Nations constitute in themselves a miniature league of nations, each with its tribal capital in a village of its own, but all represented at the confederacy capital at Ohsweken.

At the doors of Duncan Campbell Scott, a leading Canadian poet and the Deputy General Superintendent of Indian Affairs in Canada, the Indians place the responsibility for what they allege is a farcical pretense of education provided on their reservations by the Dominion Government from trust funds paid to Ottawa by the United States for land vacated when the pro-British Iroquois emigrated from New York State following the American War of Independence.

The Indians read and admire Scott's poetry, but allege that his management of their affairs has been very unsatisfactory.

Claiming to be independent "allies," rather than subjects of the British King, the Iroquois two years ago absolutely refused to accept Canadian citizenship and franchise rights, and even sent deputations to England in protest.

Attempts to dispossess an alleged Indian squatter named Vise from lands in the Indian territory, claimed to have been purchased from the Indian Department by the Soldiers' Settlement Board, recently aroused the braves, two thousand of whom had fought in the Great War. War-drums sounded nightly, with ancient war dances and paint and feathers around camp-fires on the reservations, for many days. The Indians had

been told, it appears, that the provincial and county officers, driven off the reserve by showers of sticks and stones, were about to return under the protection of a military escort.

A visit in person by the Hon. Charles Stewart, Minister of the Interior in the Canadian Cabinet, to the powwow of chiefs at Ohsweken failed to smooth out entirely the strained relations between the Dominion Government and the Indian confederacy, and it is believed the Ottawa authorities will facilitate rather than discourage the pilgrimage of chiefs to the international tribunal at The Hague.

THE NEW SITUATION IN IRELAND

THE result of the conference in London between Collins and Griffith, as representatives of the Provisional Government of the Irish Free State, and Lloyd George and Winston Churchill, of the British Ministry, has been the issuing by the Free State authorities of a proclamation calling for a meeting of an Irish Parliament on July 1 after due election of its members in agreement with provisions of the Treaty under which the Free State is to be permanently set up.

It is clear that Southern Ireland will be in an abnormal and indecisive situation until the Free State emerges from its incomplete and only semi-authoritative condition. That means a general election on lines of practically universal suffrage. But in the way has stood the clash of purpose between a Sinn Fein majority favoring the treaty and Free State and a Sinn Fein minority demanding an Irish Republic. Two courses were open; one, for the two factions to fight it out at the polls, elect delegates to a constitutional convention, and accept the Free State plan if the elected delegates were of that mind, or balk and fight if the election were the other way; the other course was for the two factions to come to some sort of compromise before any election was held.

This second and more pacific course was what took place. De Valera and Collins each yielded in part; they agreed to let the issues go to the polls on the understanding that any cabinet set up should be a coalition ministry with five Free State advocates and four of the bitter-end Republicans. This seems fair; it probably represents the proportion of the factions rather too favorably for the Republicans, but it gives the Free Staters the balance of power. What disturbed the British press and Government appears to have been doubt as to whether there was not danger of the original London plan falling through or being delayed uncon-

scionably. Hence the recent consultation in London.

In Northern Ireland Ulster and Belfast reports as to assassinations and outrages increase in terror. The assassination of Mr. Twaddell, an anti-Sinn Fein member of the Ulster Parliament, has excited general indignation. The British Government still rules in Northern Ireland; it has now at least nineteen battalions of regulars there; apparently it hesitates to enforce the law rigorously.

AN INTERNATIONAL MAGNA CHARTA DAY

THE association which is promoting the idea of an annual commemoration among the seven English-speaking nations of the granting of Magna Charta does not propose to ask any country to establish a new legal holiday, nor does it propose to bother people to become formal members of an international association.

What the Magna Charta Day Association does suggest is that on June 15 and on the following Sunday there should be some recognition of the fact that on June 15, 1215, at Runnymede, there was adopted what really was the recognition of the great principle of individual freedom as now known by English-speaking peoples the world over.

The list of honorary members of the Association is a suggestive one. It includes President Harding, the Rev. Dr. Charles W. Gordon ("Ralph Connor") of Canada, Sir James Craig, the Prime Minister of Ulster, and Dr. Wilfred T. Grenfell, of Labrador.

The founders of the Association declare that "every man, woman, and child in the Seven Nations will become a member in good standing by merely taking enough time on June 15 and on the third Sunday in June to think of what the Great Charter has done for civil and religious liberty, and to speak of the day to others."

In June, 1915, the hundredth anniversary of Waterloo suggested a comparison with the event of seven hundred years before Waterloo in that the Napoleonic attempt to impose an autocratic empire upon Europe was defeated by the Allies in 1815; whereas six hundred years before that event the English barons set in motion through Magna Charta the idea of individual liberty which in time has almost destroyed the old idea of the divine right of kings.

When this 1915 commemoration of the hundredth anniversary of Waterloo came around, the world was in the midst of a combat between the same opposed ideas of autocracy and democracy which were beginning to struggle in 1215. We quoted at the time remarks

made by Mr. Elihu Root which may appropriately be repeated here:

The first theory of the ancient republics, that the state is all in all and the individual derives his rights as a member, is the principle which was applied to Belgium. It is the principle which was applied to the Lusitania. Its logical and inevitable result is that the state is free from those rules of morality by which individual men are bound.

The other, asserted in the Great Charter, by logical and inevitable result, binds the state by the rules of morality which the individual recognizes, and the supremacy of that rule of right, governing all men and all states and powers, is the hope of mankind.

The assertion of that great and cardinal principle seven hundred years ago we celebrate to-night as the greatest of all events in the political development of modern liberty.

Every effort to honor the first assertion of the principle of individual freedom is deserving of encouragement.

THE GENOA CONFERENCE THROUGH LLOYD GEORGE'S EYES

NEVER was Lloyd George, the British Prime Minister, more plausible or persuasive than in his speech before the British House of Commons on May 25, when he made his report on the Genoa Conference. The effectiveness of his speech can be measured by the vote of confidence it elicited—a vote of 235 to 26. Coming after a sharp debate, in which the Prime Minister was attacked by Mr. Asquith, Lord Robert Cecil, and the labor leader Mr. Clynes, the vote is specially impressive.

Lloyd George's uncanny gift for retaining political support has certainly not deserted him. He never needed it more sorely than now, and never used it to greater advantage. Having planned the Genoa Conference and having given the impression that on its success depended the future of European civilization, he encountered opposition from France, which he barely overcame, and disappointment in the form of America's refusal to be represented; he then saw Russia and Germany using his Conference as an occasion to defy the other nations assembled there by the negotiation of their treaty; he had to witness the abandonment of his plans for a ten-year truce and for settling the unsettled frontiers of eastern Europe; he had to consent to the postponement of all practical attempts to bring order out of Europe's economic chaos; and now he comes back to Britain, makes a speech, responds in a few sentences to the assault of his critics, and gets a vote of nine to one that is virtually as complete an indorsement of his course as if it were unanimous. Even those who deny that Lloyd George is a statesman have

to admit that he is to-day unequaled in the world as a politician.

He described the Conference as meeting under the most distracting and unfavorable of conditions. The nations assembled included some who were not on speaking terms with one another. While the Conference sat there was "marching and counter-marching of armies toward frontiers." And yet, said Lloyd George, "we met in perfect calm and in perfect harmony."

Toward Russia he outlined three alternative policies: First, to use force; second, to leave Russia to her fate until she changes her Government (a suggestion which elicited cheers); third, to help Russia swell the volume of trade. He outlined the experiences which the British Empire delegation had had in attempting to follow this third policy. He explained the coming together of Germany and Russia by attributing it to their sense of "a community of misfortune, community of debasement, community of what they regarded as maltreatment." The refusal of Russia to accede to the demands of the Conference he attributed to the fact that between their demand and the reply there intervened the First of May—the customary day for radical labor demonstrations in Europe. He recognized that the Bolshevik Government was an oligarchy, but he added:

It is a great mistake to imagine that autocratic governments are altogether free from the influence of public opinion, and there is one public opinion in Russia, not the public opinion of vast masses of people—ninety-five per cent of the people are indifferent to this system or hostile to it. The only opinion there that matters is the opinion of the workmen in the towns, who represent less than one per cent of the whole population. But the Soviet system and its power is based upon that. It is not democracy, it is oligarchy. And this talk about nationalization in Russia is all humbug when they talk about the great principles of the Revolution. . . . You have the paradox of a Communist Government speaking in the name of an individualist population.

The Bolshevik reply to the demands of the Conference was, in Lloyd George's phrase, "so foolish a document that it could only have been written by a very clever man." He asked how many trade unions would have invested their funds on the strength of that document. When the First of May came, the Bolshevik delegates ceased to talk business and "nailed their flag to that barren fig tree of Communism, under which multitudes are dying of pestilence." He drew an alarming picture of the danger threatened by the Red Army at the present moment. On the other hand, he said that the agreement among the nations

to abstain from any act of aggression while the questions raised at Genoa remain under examination raised the hope that the consequent sense of security would dispel the fears that cause war. "We have already captured positions," said Lloyd George in conclusion, "from which a further advance can be made." During his speech he showed a more conciliatory attitude toward France than has sometimes characterized him, and in answer to his critics he said definitely that it was impossible to settle the reparation question without carrying along the judgment of France, and that he desired to work with the good will of the democracy of France. To the suggestion of Lord Robert Cecil that it might be possible to get the United States into conference Lloyd George replied that he had invited, pleaded, and used every other method except force to get the United States into conference, and if the noble lord could do anything more his assistance would be welcome.

GENOA THROUGH AMERICAN EYES

LLOYD GEORGE'S speech furnishes in itself a full justification for the refusal of America to take part in the Genoa Conference.

In the first place, he makes it clear that the Conference was devoted chiefly, if not wholly, to European international politics. America helps nobody, and helps least of all herself, when she tries to give advice on the politics of Europe. Of course every European Power would like to get American backing. The weight of America in the balance of power is worth seeking; but we have no interests to serve in satisfying any European nation's desire for our aid in establishing that balance in its favor. If the issue at Genoa had been a plain one, with the forces of aggression on one side and the forces of defense on the other, an issue as plain as that which arose when Germany undertook to dominate the world, the case would have been different; but the issue was not plain; if there is any danger threatening the peace of the world, it is resident in the oligarchy headed by Lenine and Trotsky's Bolshevik Government in Russia; and yet we find Great Britain advocating measures, not of resistance, but of aid. It is clear that on the only issue of first magnitude in Europe there are differences of policy between nations that are equally our friends. In such disputes we cannot afford to become entangled.

In the second place, the speech of Lloyd George makes it perfectly clear that our Government was right about Russia. As long as that distressed country is in the hands of an oligarchy that has no regard for its pledged word and

no true feeling of friendliness for any other nation, as even Lloyd George recognizes it is, American participation in any conference with Russian representatives would raise false hopes, and would postpone, instead of promoting, the resumption of financial and commercial relations between Russia and the rest of the world.

It does not seem likely that Lloyd George's speech, exposing the political character of the Genoa Conference, which professed to be economic, and picturing the nations of Europe seeking commercial advantages by negotiations with a Russian Government that is as destructive of business and trade as it is of political and industrial liberty, will do anything to change the policy of this Nation in regard to Europe's political problems, and in particular in regard to Russia. America has been charged with the worship of the dollar; but, in spite of her defects, she is not likely to take part in any arrangement which for the sake of dollars will bolster up a régime so opposed to American conceptions of civil liberty and business honor as that of the Bolsheviks. American common sense will see in such an arrangement no service to the cause of freedom, no sound promotion of commerce, and only further burdens for the Russian people.

THE DOOM OF THE TWELVE-HOUR DAY

ONCE, not so many years ago as to be beyond the recollection of living people, the work day in industries of all kinds was very generally twelve hours long. Gradually, sometimes by peaceful means, sometimes with turbulence, the work day prevailing in factories was reduced. To-day what was once an ideal has become common in practice. Eight hours constitute the normal day's work in so many industries that the eight-hour day has come to be regarded very widely as the unit by which a day's wages are reckoned. And yet one of the greatest industries in America, a basic industry on which the life and prosperity of almost every kind of manufacture and certainly every method of transportation depend, has retained for many of its workers the old twelve-hour day. That laggard industry is the steel industry.

Now it appears certain that the steel industry will render the twelve-hour day obsolete.

On May 19 the newspapers of the country published despatches from Washington reporting the fact that at a conference with the President of the United States at the White House the

leaders of the steel industry, including the two foremost steel men of America, Judge Elbert H. Gary of the United States Steel Corporation and Charles M. Schwab of the Bethlehem Steel Corporation, had agreed with the President in approving in principle the abolition of the twelve-hour day, and had authorized the President of the American Steel and Iron Institute to appoint a committee of five to make an investigation and report to the industry on the subject. According to the statement given out at the White House, the President explained "that there was no intention of Government interference in private business, but that we are about to witness a great industrial revival, and the one hope of abolishing the excessively long working day was to do it before the full swing is resumed."

This conclusion, reached by those who are in command of this great industry, is the result of a discussion, amounting at times to an agitation, which has been continuous for the past decade. It was, in fact, eleven years ago last month that the stockholders of the United States Steel Corporation adopted what, from the name of its author, has come to be known as the Cabot resolution. That resolution called for an investigation of statements made in an article by John A. Fitch published in the "American Magazine." At that time the stockholders' committee recommended the ultimate abolition of the twelve-hour day together with its natural accompaniment of the seven-day week. Since that time there has been developing a public opinion that has grown more and more insistent in its demands for the abolition of these survivals of a past industrial age. Finally, a year and a half ago a thorough study of the subject was presented to a joint meeting of the Taylor Society, an organization to promote scientific management, and certain sections of the National organizations of mechanical and electrical engineers, by a management expert, Horace B. Drury.

In that address Mr. Drury made plain the reasons for the survival of the twelve-hour day in this industry. In the ordinary factories, in which it is possible to discontinue work and resume it after an interval of a few hours, the reduction of the work day is comparatively simple; but in a continuous industry, like the steel industry, in which furnaces have to be kept going all the time, day and night, it is not practicable to assign men to work except in shifts of equal fractions of twenty-four hours. It was easy, comparatively, to change the working day from twelve hours to ten, let us say, in a textile mill; but it was impossible to do that in a blast furnace. The only change that seemed

practicable was one from twelve to eight hours, and that change was too radical to come in the ordinary progress toward shorter hours. Moreover, the work in a steel plant is intermittent. Men who work twelve hours are not working at top speed during that time. For a considerable part of the time they can sit about and smoke and talk and even sleep. And even when the work is hard, it is not as hard as one might imagine it would be. A great deal of the heavy lifting that used to be done by man power is now done by machinery.

Naturally, for labor of this sort "the steel industry has for many years," Mr. Drury explained in his address, "recruited its workers from a class of men to whom this combination of long sluggish hours with rather high weekly earnings has had a peculiar charm; and that is the class of newly arrived foreign-born workers. . . . Men of this type would sometimes be willing to work four extra hours for almost nothing. Outside is alien America; inside is the one environment to which they have become in a measure accustomed. Outside are the squalid streets and often wretched dwellings, and nothing special to do except to dissipate the money that one is trying to save; inside are one's fellow-workmen and companions. . . . In fact, there has grown up among these foreigners, and among the Americans as well, a special mode of existence in which the shop rather than the home, or other outside institution, has become to a large extent the center of living. Just as sailors have learned to spend their lives at sea, miners to spend much of theirs under ground, and traveling salesmen and engineers to spend much of theirs away from home, so the steel worker spends his life in the shop."

Such facts as these explain the survival of the twelve-hour day, but they afford no reason for its continuance. Even were the men contented with this life, as they are not, it would be contrary to the interests of the country to have it made permanent. A twelve-hour day means at least thirteen hours away from home. It is not, as Mr. Drury points out, so much because of what goes on inside the shop as because of what a man misses outside that the country should insist that the twelve-hour day be abandoned. That means that the man has no time for his duties as a father of a family and as a citizen.

The men themselves, who have in the past acquiesced in the twelve-hour day, are realizing this fact; but the country ought to realize it more keenly. The twelve-hour day, as Mr. Drury says, simply means "the accentuation and continuance in American life of those lines of class and culture which immigration

has already made too dangerous and deep."

The interests of the men and of the citizenship of the country, however, are not the only reasons for the abolition of the twelve-hour day. Strong reasons are also found in the interests of the industry itself. The twelve-hour day means sluggish work; it means the prevention of measures for making labor in the steel industry efficient; it develops indifference and inattentiveness that inevitably result in costly accidents; it creates what Mr. Drury terms the "lax moral tone which must pervade an industry where sleeping is tolerated;" it calls for foremen who feel that they must drive in order to get anything done; it makes for waste, including the unnecessary impairment of tools and equipment. "Who will deny," asks Mr. Drury, "that in the long run a brighter future is bound to lie before an industry which has learned that work is work, and has decided that long dull hours and half-asleep workmen will no longer do?"

The arguments for the abolition of the twelve-hour day thus based on reason are reinforced by experience. Some steel mills in America have changed from the twelve-hour to the eight-hour day. It is impossible here to report the evidence that Mr. Drury marshals; but the conclusion is plain that the change is not impracticable, for it has worked. It is true that it has resulted in some increase in the cost of production; but that increase is slight. That increase in cost in pig iron that sells for \$40 a ton would amount to only 21 cents; and on the steel ingot that sells for about \$46 that increase would be only about 46 cents; and there are steel manufacturers, according to Mr. Drury, who believe that under the three-shift system steel will not cost any more ultimately, and perhaps not as much.

It is not without significance that, except in the Orient, practically all other great steel manufacturing countries (Britain, Belgium, France, Germany, Sweden, Spain, Italy) have abandoned the twelve-hour day.

The change to the shorter working day is surely coming. The only question is the method of the change. It is better to have it come without turmoil and industrial warfare. It is better to have it come under the direction of men who know the steel industry, rather than under the direction of men who are ignorant of it. It is better to have it come by the voluntary action of the industry rather than through political pressure. And it is better to have it come at a time when there is a dearth of employment, and when workmen will therefore more easily adjust themselves to the change because they will through the

change find more jobs. This is the time when circumstances seem specially fitted for a reform that has in it possibilities of benefit alike to the workingman, the employer, and the country.

THE CASE OF ATTORNEY-GENERAL DAUGHERTY

TWO charges against Mr. Daugherty, Attorney-General of the United States, have been made on the floor of the Senate and widely repeated in the newspapers. The first is that in his connection with the notorious Morse case he displayed a low standard of legal ethics; the second is that he has

(C) Harris & Ewing

ATTORNEY-GENERAL DAUGHERTY

been lax and partial in his prosecution of fraudulent war contract cases. The least important of these charges, the second, has received the greater emphasis. In our judgment, he must stand or fall upon the first charge.

So far as we have been able to discover, the accusation that Mr. Daugherty has shown personal, financial, or political favoritism in his official attitude towards fraudulent war contracts is based upon mere suspicion, rumor, and gossip. The Attorney-General indignantly denies this charge, concerning which no direct evidence has been published, and has announced over his own name that a special division of the Department of Justice has been organized for the trial of these cases; that expert and distinguished lawyers have been engaged to aid in the work; and that the prosecution will be carried on vigorously without fear or favor. Any judgment as to his impartiality in these cases ought

to be suspended until the cases are tried and he can show what he is able and willing to do as a prosecutor. The Attorney-General is at least entitled to the protection afforded to any common criminal by the principles of constitutional law. He is entitled to be regarded as innocent of collusion with fraud until he is proved guilty.

The charge regarding Mr. Daugherty's standards of legal ethics is, however, more serious. It concerns character, and not legal acts. It depends, therefore, not upon technical evidence, but upon personal judgments and valuations.

On May 22 Senator Caraway read into the "Record" on the floor of the Senate a long letter purporting to have been written and signed by Thomas B. Felder, a New York lawyer, in which Mr. Daugherty's connection with the Morse case is outlined as follows. The italics are ours:

To begin at the beginning, permit me to say that after Charles W. Morse was sent to the penitentiary at Atlanta, Georgia, under a fifteen-year sentence, and after his attorneys and family had exhausted every resource that they possessed or ingenuity could suggest, Hon. Fred L. Seely, then the editor and proprietor of the Atlanta "Georgian," who had, as I understood it, a benevolent and charitable interest in the fate of Morse, and who had been for some years theretofore a client of mine, came to my office and stated to me that I had convinced him of my resourcefulness and my capacity to "do things," and, while the Morse situation seemed hopeless, because the President had refused, on the best showing that could be made, either commutation or pardon, yet he had desired me to examine thoroughly the record and if in my judgment anything could be done he would cause me to be employed in the case and would see that I was substantially compensated for services rendered in proportion to their value to Mr. Morse.

I read the record, studied the case thoroughly, got in touch with Mr. H. M. Daugherty, of Columbus, Ohio, who stood as close to the President as any other lawyer or citizen of the United States, and interested him in the case, agreeing to divide with him any compensation that I might receive. We took the matter up with the Attorney-General and with the President, stating to them that the record disclosed that in refusing to extend Executive clemency reasons were given which were not borne out by the record and we requested that the case be reopened.

We were informed by the President and the Attorney-General that the act of the President rendered the matter a "closed incident" for the present, but if we would bring the matter to their attention again just before the term of office of the President expired in March, 1913, the matter would be reopened and perhaps a different action taken in respect thereto.

This decision was communicated by

Mr. H. M. Daugherty and myself to Mr. Morse, who had agreed to pay \$6,000 cash to cover expenses (this sum was paid) and \$25,000, conditional upon our obtaining his release from the penitentiary.

When this result was reported to Mr. Morse, he stated to us in the presence of the penitentiary guard that if we would renew our efforts to obtain his release he would pay us, in addition to the amount agreed upon, the sum of \$100,000, and exclaimed, "Gentlemen, I will make you both rich if you will get me out of here."

The Felder letter goes on to say that after Morse was pardoned, owing to the efforts of Mr. Daugherty, he (Felder) and Mr. Daugherty received \$6,000 in cash and \$25,000 in worthless stocks; that Mr. Daugherty "complained very bitterly of our treatment by Morse" and after a personal interview with Morse "positively and emphatically declined to take the stocks either in payment or as collateral security" and insisted on a better form of cash.

In this letter Mr. Felder makes the naïve statement, apparently without in the least appreciating what it means, that Mr. Daugherty sold to Morse, a convicted criminal of unsavory reputation, his political influence with President Taft for \$31,000 and a possibility of a much larger sum.

Nearly a week elapsed before Mr. Daugherty made any reply to the Felder letter. He then wrote to Senator Watson, of Indiana, making no protest against or denial of Felder's narrative of his relations with Morse, but simply saying: "All I ever received from anybody in connection with the Morse cases, both civil and criminal, was about \$4,000."

The office of Attorney-General of the United States is one of the most important in the structure of our government. The entire system of justice, in a sense, rests upon it. Its incumbents ought to be, not merely ordinarily honest men, but men of an unimpeachable and delicate sense of honor. As the case now stands, with Mr. Daugherty's own admissions it is apparent that, whatever may be the partisan motives of his Senatorial accusers, his sense of propriety is not over-delicate. His implied excuse that his offense, if any, cannot be a very large one because he received only \$4,000, a sum which gave him no profit but only partly paid the expense he incurred, justifies, we think, this criticism of his delicacy.

It is extremely regrettable, if not dangerous to good government, that an Attorney-General of the United States and a member of the Cabinet should be placed by his own acts in the situation in which Mr. Daugherty now finds himself.

AWARDS OF MERIT

IT has been proposed that there should be a discontinuance for some time of the Nobel prize awards in order to increase the capital sum from which the awards are derived and thereby make the prizes larger, or perhaps enlarge the number and scope of the awards. The latter would seem to be far the more desirable object, for the prizes are already large in money value and there are in the world's field of endeavor untouched possibilities for the recognition of distinguished services to mankind.

Such awards as come from the Nobel foundation, from the French Academy, from the de Goncourt and other French committees, and from the interesting offer by Mr. Bok of a prize of \$10,000 to the citizen who has done the best service to Philadelphia, are valuable, not only as recognition of achievement in art, literature, science, and public advancement, but as encouragement to all who are striving to translate ideals into concrete form and make more common beauty and knowledge and the accomplishing of things worth while.

One is struck, in reading the announcement just made through the Columbia University School of Journalism of the annual awards of its Pulitzer prizes, by the number and scope of the incentives here furnished both to Americans who have achieved and to Americans who are struggling toward achievement. Thus, there are three traveling scholarships of \$1,500 each for the pupils of the school who have done the best work in their courses and two other equally well endowed scholarships for American art and music students of promise and talent. For journalism at large there are awards to the newspaper which has done the most meritorious and distinguished service in the year, to the writer of the best editorial, and to the reporter who has done the best piece of accurate, terse, and valuable journalistic work. This year two of these three prizes fell to men who made the most of the notable opportunity offered by the ceremonies at Washington last Armistice Day over the Unknown Soldier. Mr. Kirke L. Simpson, of the Associated Press, won the reporter's prize; Mr. Frank M. O'Brien, of the New York "Herald," was adjudged to have written of the Unknown Soldier in a way that best stood the tests of clearness of style, moral purpose, sound reasoning, and the power to influence public opinion rightly. Many of our readers will remember Mr. O'Brien's editorial; its opening paragraphs were as follows:

That which takes place to-day at the National Cemetery in Arlington

is a symbol, a mystery and a tribute. It is an entombment only in the physical sense. It is rather the enthronement of Duty and Honor. This man who died for his country is the symbol of these qualities; a far more perfect symbol than any man could be whose name and deeds we knew. He represents more, really, than the unidentified dead, for we cannot separate them spiritually from the war heroes whose names are written on their gravestones. He—this spirit whom we honor—stands for the unselfishness of all.

This, of all monuments to the dead, is lasting and immutable. So long as men revere the finer things of life the tomb of the nameless hero will remain a shrine. Nor, with the shifts of time and mind, can there be a changing of values. No historian shall rise to modify the virtues or the faults of the Soldier. He has an immunity for which kings might pray. The years may bring erosion to the granite but not to the memory of the Unknown.

The jury which made the decision as to the journalistic prizes found that the most noteworthy single public service rendered individually by one newspaper was the New York "World's" series of articles exposing the operations and nature of the revived Ku Klux Klan.

There is always wide interest in the Columbia awards as to literature and the drama. There seems to be general approval of the bestowal of the \$1,000 prize for the American novel "best representing the wholesome atmosphere of life and the highest standards of American manners and manhood" to Mr. Booth Tarkington's "Alice Adams." Many critics would place this novel lower than Mr. Tarkington's "The Magnificent Ambersons," which had already received the same honor; while of course there will be a difference of opinion as to whether one or two other novels of 1921 are not equal in force or dramatic quality to "Alice Adams." But the committee could choose but one, and their choice is creditable. The award of a prize of \$1,000 to Edward Arlington Robinson for his "Collected Poems" as the best volume of verse put forth during the year is beyond question an admirable decision. Hamlin Garland's "A Daughter of the Middle Border" in the field of biography, Mr. James Truslow Adams's "The Founding of New England" in that of American history, and Mr. Eugene O'Neill's "Annie Christie" in that of play-writing, round out the list of the Columbia awards.

A distribution of tokens of merit such as this is a stimulus to comparison and discussion—a stimulus even if it arouses contradiction. The founder of the prizes made a valuable contribution to the growth of American imaginative activity and a help to American literary and art development.

THE GREAT "UNDER-WEIGHT" DELUSION

UNDER the above title Mr. Charles K. Taylor, an expert in physical training, contributed to The Outlook of March 15 an article of which this was the dominant note:

How often have you seen this common sight? A slender, wiry mother places slender, wiry little Willy on the station scales, drops in a penny, and gasps in horror. Tables printed on the scales state that boys of Willy's age, and particularly of Willy's age and height, should weigh just about 85 pounds. And little Willy, doing the best he can, achieves but 75! And that mother, with startled intellect, realizes that little Willy must be *under-weight*—direful term! A term that brings consternation to teachers and parents by the thousands, and urges investigating examiners of various kinds to a verge of hysteria!

Mr. Taylor then proceeded to demonstrate his theory of "height-weight," or, in other words, that "the standard to go by is not one of weight, but of health and physical development."

No article that The Outlook has re-

cently published has brought a greater number of letters of protest and approval. Five hundred or more were received by Mr. Taylor alone, largely from teachers, physicians, and directors of physical training.

Notable among those who approved we mention Dr. Dublin, of the Metropolitan Life Insurance Company of New York, an institution which has achieved extraordinary results in child conservation; and Dr. R. Tait McKenzie, the distinguished sculptor and student of the human figure and Director of Physical Training in the University of Pennsylvania. We shall publish before long an article by Dr. McKenzie on "Variations in Physical Types," illustrated from the human figure.

Notable among the protestants was Mrs. E. R. Grant, Director of the Children's Health Crusade, Washington, D. C. Her article appeared in The Outlook for May 10. This week we print two more contributions to the discussion, one pro and one con. The first is by Dr. L. Emmett Holt, one of the most distinguished of living specialists

in the therapeutics and hygiene of children. The second is by Mr. Angelo Patri, author of "A Schoolmaster in the Great City" and principal of Public School 45, in the Bronx, New York City. Mr. Patri is contributing to the New York "Evening Post" a daily sketch which illustrates some problem of school-child life. With his special permission we here print one of these sketches which is pertinent to the discussion of the problem.

There are two conclusions to be drawn from this controversy in which we think all the participants will concur. First, popular and even professional opinions on questions of hygiene and physical culture are as ardent and sometimes as polemical as those in the field of metaphysical theology. Second, there is an almost universal interest in the correct physical training of American boys and girls which promises well for the future. The schoolmen's motto, which used to be so commonly quoted and so commonly broken, *Mens sana in corpore sano*, is no longer to be regarded as a mere convention.

I—CHILD WEIGHING NOT A FAD

BY L. EMMETT HOLT

THE campaign, if it may be so called, for weighing and measuring children is a general health movement which has spread, not only over this country, but over the world. It is not a fad. It is a carefully considered movement indorsed and advocated by the leading physicians interested in children, by health officers, and by nutrition workers throughout the country. For one not a physician to attempt to discredit this whole movement and to characterize it as a delusion seems, to say the least, somewhat presumptuous.

If the conclusions which might be drawn by the uninformed were not so serious, Mr. Taylor's articles and his position might be passed over without comment. It seems incredible that any person who has critically studied the nutrition of children for a period of years should arrive at such conclusions and make such statements as some of those made in his articles in The Outlook of March 15 and May 10.

It is of course generally recognized that not all healthy children are of the same height or weight for a given age, or even of the same weight for a given height. In the publications upon this subject this has been constantly emphasized. The *average* is not the *normal*; the average is a line; the normal is a zone. All of those who have been most interested in the nutrition of children recognize this range of variation

and include in the normal zone children who are less than ten per cent below or twenty per cent above the average weight for the height. This standard is a somewhat arbitrary one, but in practice it serves well.

Practically, it is found also that if children vary to a greater degree than this on either side of the average something is wrong; that outside of this normal zone underweight is likely to be a disease, something needing investigation; and upon critical examination many other things are found to be wrong with such children.

Naturally the revelations of the monthly weighing of school-children were somewhat of a shock to many complacent parents who had regarded their children as perfect and their care and feeding in the home as above criticism. To be told that they were not doing their full duty and had neglected some matters which were important in their diet and care was disturbing. For such parents to be assured, as in Mr. Taylor's article, that their children were all right, that there was no need to be disturbed, was a great consolation.

It is possible that some persons regard the movement of measuring and weighing children and the teaching that goes with it as unsound, something that will soon pass. But such is not my belief. The movement is based upon the fundamental proposition that the weight

of the child is the best simple method we have of estimating the state of his nutrition. The mother has learned this about her baby. Once she was satisfied if her baby looked well even if not up to weight; but she has learned that the under-weight baby is not a normal baby. A great reduction in infant mortality has resulted as a consequence of the campaign to teach the mother the significance of the weight.

So parents are learning that an older child who is habitually under-weight beyond a certain normal range is also one whose condition should give them concern. Weight is just as important and just as valuable in its relation to the nutrition of older children as of infants.

In the great majority of cases children who are under-weight are so, not because of inheritance, but because in the home the simple laws of health are constantly being broken. One has only to watch children in hotel dining-rooms order their own meals to see how badly they have been taught to select their food, or in the homes of one's friends to see what children are allowed to eat. Equally important and equally vicious are the other habits which the child of to-day is allowed to form: evening entertainments and a bed hour of ten or eleven o'clock for a school-child of ten years who should be in bed at eight.

That none of these rules can be violated without injury to the child we

have examples in practice every day. But people do not always like to be enlightened; they do not like to change their habits; they are not courageous enough to change the habits of their children, but in their fond fancy they insist upon indulging them to the extent

of greatly interfering with their normal growth and development. Such parents will be gratified to find in Mr. Taylor's article ample justification of their position. Those who look deeper and realize that better things can be done for their children than they are doing now will

indorse and support the weighing campaign and the health education which accompanies it. For the purpose of weighing and measuring children is not to collect statistics, but to interest the children themselves in health, and this it is found to do.

II—THOSE STANDARD TABLES

BY ANGELO PATRI

[Copyright, 1922, by Angelo Patri and reprinted by special permission from the New York "Evening Post."]

MISS JENNIE was annoyed about something.

So much was clear to the most casual observer, and after she had kept perfectly still for five minutes without the least sign of a rift in the enveloping gloom Miss Lavinia asked: "What is the matter?"

"Did you ever feel foolish?"

"No, never," retorted Miss Lavinia, acidly. "Why take such a common state so much to heart?"

"I wouldn't care so much, only I worked so hard to do it. I was very particular about the job. I left nothing out. Serves me right for taking a report for granted.

"You know Armond? You know how tiny he is? The doctor and nurse weighed and measured my class, and of course they found Armond under-sized and under-weight, according to the

standard tables, and gave me a slip for him.

"I filled out the slips religiously, even underlined and red-inked them, Armond's along with the rest. This morning I got a polite note from his mother asking me to come in and see her.

"When I got there, she and Armond's father seemed to be enjoying a joke between them. 'I asked you to come in and have a chat with us about Armond. You say he is under weight and height and suggest that we feed him up and exercise him and all that in order to bring him up to normal. Now, Miss Jennie, we would like to know just what your norm for Armond's height and weight is. We thought him in pretty good shape. What height, for instance, would you consider normal for him?'

"I almost choked. There those two

stood laughing at me out of their eyes. Neither of them was five feet high. The tiniest people, and the healthiest you can imagine, and just bubbling over with fun. Armond came in and stood beside them, and a blind man could have seen that he was the healthiest young animal alive.

"I couldn't say it was the doctor's fault. I hated to say it was my own. I knew I should have thought about the slips before I sent them out. I felt like a fool, and I just up and said so.

"They laughed right out and said I wasn't. But—believe me—next time—

"I know now and forever that a child is normal to himself and he may or may not be up to the standard tables. Wait until I see that doctor."

"'Twasn't his fault at all," Miss Lavinia said. "He only measured the children. You knew them."

KNOLL PAPERS

BY LYMAN ABBOTT

THE GREAT COMPANION

How would you answer the following question, asked by a member of a Bible class?

"Assuming the truth of the evolutionary hypothesis, do you think the Rabbi Wise or Silverman or any other leader of the Jewish people of the present day is wiser, or more spiritual, or more capable or godly, than were Solomon, David, Moses, or Abraham?"

"If the present-day Jewish leader is not superior to Solomon, David, Moses, or Abraham, then how do you account for our 'Lord Jesus Christ,' who was born at a time of the world's history which was corrupt religiously and otherwise? Also where does the common idea of evolution as a development come in?" A. W. HAND.

THE existence of great men is one of the many phenomena which seem to me wholly inconsistent with the philosophy of materialism, which assumes that every phenomenon is caused by conditions immediately preceding. William James, in his essay "Great Men and Their Environment,"

states this inconsistency with characteristic humor. "Can it be," he asks, "that Mr. Spencer holds the convergence of sociological pressure to have so impinged on Stratford upon Avon, about the 26th of April, 1564, that a W. Shakespeare with all his mental peculiarities had to be born there?"

But the phenomenon of genius affords no such difficulty to one who believes, as I do, that wheresoever life is God is. The influence of the Great Spirit on human spirits is no more mystical than the influence of one human spirit upon another human spirit, or than the fact that a flower and a weed are produced out of the same soil under the same rain and sunshine. To the idealist evolution is a directed development, as a garden is a directed development. God works upon men through men. Great men are simply under-gardeners contributing the spiritual force which is as necessary to human development as sunshine is to vegetable development.

In my childhood the common belief which, with the majority of church-

goers, I got from church and Sunday school was something like this: Six thousand years or so ago God created the world—perhaps the universe—and endowed it with certain natural forces. His relation to it was analogous to that of an architect to a building. His relation to men was analogous to that of a ruler to his subjects. The titles given to him were "The Great First Cause" and "The Moral Governor of the World."

I have definitely substituted a radically different philosophy. I know nothing about the origin of either matter or spirit. Creation is not a definite act making something out of nothing; it is a continuous act bringing order out of chaos. It is a process, not a product. The relation of God to the world is less like that of an architect to a building than like that of the spirit of man to his body. The relation of God to the children of men is less like that of a moral governor to the subjects of his rule, whose obedience he enforces by laws and penalties, than like that of a father, who by spiritual power, by what we

vaguely call his "personality," shapes, colors, informs, inspires the *life* of his children. God is not a Great First Cause; he is a perpetually active Cause, as truly creating now as he ever created. He is not a moral governor or "Invisible King," but a Father. Inspiration is not an occasional and rare episode. He inspires the plowman no less than the poet. Read the plowman's ode in the Twenty-eighth Chapter of Isaiah. The destruction of Sodom and Gomorrah and the crossing of the Red Sea are not exceptional interferences of God in nature. All the operations of what we call nature are subject to his will. If we could imagine the spirit of God withdrawn from the earth, the earth would crumble into dust as the body of man crumbles into dust when the spiritual tenant which has occupied it withdraws from it.

The Hebrew prophets are not the only men who have heard his voice. He is constantly speaking. All mothers may converse with him as well as Hannah, all statesmen as well as Moses. God is the All-Father. We are all his offspring. Christ is the supreme Man of history because he is the supreme manifestation of the Great Spirit in a human life. He is called the only begotten Son of God because *all* his life flowed from the divine fountain. This is the meaning of

such declarations as that of Paul: "In him dwelleth all the fullness of the God-head bodily." The Bible is not an infallible book *about* religion; it is a book *of* religion—that is, of religious experience. Professor Huxley, without mentioning it, defines it. He says:

As there are Pascals and Mozarts, Newtons and Raphaels, in whom the innate faculty for science or art seems to need but a touch to spring into full vigor, and through whom the human race obtains new possibilities of knowledge and new conceptions of beauty; so there have been men of moral genius to whom we owe ideals of duty and visions of moral perfection, which ordinary mankind could never have obtained; though happily for them they can feel the beauty of a vision which lay beyond the reach of their dull imaginations, and count life well spent in shaping some faint image of it in the actual world.¹

I have not the space here to trace the progress—political, sociological, scientific, and religious—which in my lifetime has promoted this radical change in our conception of God and his relation to nature and to life. Undoubtedly it has led some men to ignore the life of the spirit altogether, but it has led

¹ Huxley, "English Men of Letters," Vol. VI, p. 242.

many to a deeper spiritual faith and a better understanding of the life of the spirit in man and of the Great Spirit in the universe. As an experience it is stated briefly and clearly by Basil King in his interesting volume "The Conquest of Fear." "The Caucasian," he says, "pigeonholes God. Otherwise expressed, he keeps God in a specially labeled compartment of life, to be brought out for occasional use and put back when the need is over." This theological conception of an appearing and disappearing God he contrasts with a paragraph from Joubert, an eighteenth-century French Catholic: "The soul cannot move, wake, or open the eyes without perceiving God. We perceive God through the soul as we feel air in the body. Dare I say it? We can know God easily so long as we do not feel it necessary to define Him."

I then count genius to be a peculiar phase of that inspiration which is the secret of all life. The painter, the sculptor, the musician, the architect, interprets the Great Artist, the scientist interprets the Great Mechanic, the pioneer interprets the Great Leader, the priest and the prophet interpret the Great Lover, and each one of us by his more humble career can interpret the Great Life-Giver, for, to quote Joubert again, "God is known to us through piety."

GREAT-UNCLE JOE

BY MARJORIE AUSTIN

HE sat, one summer evening, just outside
The golden circle that the lamp flung wide,
Watching the merry group which, at his whim,
Stood by the organ there, and sang for him.

Illness had torn him from his days of toil,
From his loved flocks and well-attended soil,
And set him there to wait with patience grim
Till time should pass, and be no more for him.

He was an old man, bearing still the trace
Of wind and sun upon his rugged face.
Long days of pain had made new furrows there,
And whitened all the silver of his hair.

His head was bent, his calloused hands lay still,
His whole great body sagged, toil-worn and ill,
But still his eyes burned with a steady gaze,
Piercing, yet kindly, as in younger days.

The group about the organ sang a while,
Then, from beneath an unused music pile,
Pulled out a book, long unremembered there,
And played and sang an old camp-meeting air.

And I, a child, drifting about the place,
Saw a slow tear slip down the old man's face,
And felt ashamed for him—a mere child, I,
Who could not know why an old man should cry.

ATHLETIC PAGEANT FOR THE CONGRESS OF MOTHERS IN THE STATE OF WASHINGTON

The school-children of Tacoma, Washington, in honor of the National Congress of Mothers in session in that city, took part in a great gymnastic and athletic demonstration. Over 16,000 school-children took part in the events, the delegates to the Congress viewing the proceedings from specially reserved seats. The photograph gives a general view of the exercises.

AMERICAN SOLDIERS HAVE THEIR LAST ATHLETIC MEET ON THE RHINE

Here is the latest view of the model athletic field at Carnival Island, near the city of Coblenz, with the 8th Infantry regimental mass games being played. The field will remain as a gift of the United States to Coblenz. The Army first turned over the equipment to the Y. M. C. A., and the "Y" in turn decided to present the field to the city of Coblenz.

A CHAMPIONSHIP GAME OF MARBLES

Frank McQuade, of Baltimore, is the marble-shooting champion of the country. Here is a picture of the finals in which he won the title, vanquishing his opponents from Philadelphia, Newark, and New York, in which places the competitors of the local champions had been eliminated in trial games. Young McQuade is here seen beginning his game with Nicky Markoff, New York City champion

A PEEVISH HERO

Babe Ruth returned to the baseball world on May 20, after having been suspended for several weeks by Judge Landis. His reception from nearly forty thousand fans at the Polo Grounds was one of great enthusiasm. But a baseball crowd is fickle. It uncrowned its "home run king" by hooting when he made only one home run in several games. Then the hero turned quarrelsome, chased a hooting critic out of the grand stand, threw gravel at the umpire, and was promptly "sent to the showers" and later was fined \$200 and deposed as captain of the "Yankees"

INTERCOLLEGIATE ATHLETICS

SHARP COMMENTS BY UNDERGRADUATES

IN this third group of prize-winning letters from undergraduates of American colleges the readers who have followed this expression of student opinion will find, we feel sure, quite as representative and interesting contributions to the debate as in the two groups already published. All of the writers were winners of fourth prizes, but in frankness and in sharp comment and free and direct criticism their letters are quite as noteworthy as were the letters from the winners of the higher prizes, even if not as thorough in presenting a well-thought-out line of argument.

We think that athletic graduate committees in colleges can get some shrewd and practical hints from the points made here by these four undergraduates.

Among the things that the writers whose letters we present herewith caustically criticize are the stressing of star players, the desire of the grand stand to see the side it favors

win at any price, the lack of appreciation of the student who studies while the athlete is idolized, the spirit of professionalism in college rivalry, the backing of one's team by betting. How far such things are general or typical is another matter. So far as they do exist, such protests as appear in these letters from students must, we are confident, exercise an influence in making college athletics independent and wholesome.

As we said in estimating the general trend of these letters from one hundred and twenty-five colleges in all parts of the country, "Undergraduate opinion not only favors athletics as a source of recreation and pleasure, but, and beyond that, because athletics foster the college spirit, and loyalty to the college is as essential for the functioning of college life as loyalty to the country is essential to the functioning of citizenship."

THE LURE OF ATHLETICS

ABOVE the door of State Gym at the Iowa State College hangs a copper plate bearing these words: "If by gaining knowledge we destroy our health, we labor for a thing that will be useless in our hands. He that sinks his vessel by overloading it, though it be with gold or silver or precious stones, will give its owner but an ill account of his voyage." Its purpose is to instill into each red-blooded student passing under it the necessity of a well-rounded development. It has served in the past, but to-day the pendulum is slowly but surely moving towards athletics with a physical development at the expense of the mental. Ten years ago John —, now county agent of a western Iowa county, was the star quarterback of the Ames football team. On the field he "hit the line hard," played up and played the game; at his study table he learned the fundamentals of his profession. He never sacrificed football for studies or *vice versa*. When he was graduated, he was prepared to face both the world and his chosen vocation—the two situations which every college graduate must face. Last year a number of fine athletes were graduated from the same institution, but only a small percentage of them took up the work which they had majored in while in college. Instead they are instructing or coaching athletics in high school or college, thus continuing to spread the development of the physical at the sacrifice of the mental side of a man's development. But herein lies the trouble. The professions to-day need technically trained men who can face the world, but too large a number of them are going back onto the athletic field. Why is this true? I believe that the colleges of to-day are so thoroughly inoculated with "jazz" that students are thinking in lighter channels. Sports are over-emphasized; victory must be had at any price, the champions are worshiped for their ability until they become gods before the eyes of the

junior college. The real spirit of the game is forgotten; the primary purpose of athletics is sacrificed for the big headlines in the daily paper. The "star" write-ups furnish excellent incentives for individual play rather than for teamwork, and too often co-operation is sacrificed for the "grand-stand plays." I would not have the understanding that the players are entirely to blame; the spectators often influence the action and plays on the field. During the recent Ames-Iowa homecoming game, played at Ames, many were the hoots and jabs hurled at "Duke" Slater, the colored All-American tackle of the opposing team. The spectators' ethics were to win at any price, to win whether right or wrong. The practice of betting has recently reached college athletics and has spread like wildfire. Unless soon checked the result to college sports will not be far different from what it has been to horse-racing and to professional baseball. The smuggling in of professional players has placed a question-mark upon the ethics of true athletic spirit. Just lately have examples of this been exposed to the eyes of the public. If the present situation affected only the players themselves, the result wouldn't be so bad, but its evil effect is noticeable upon the younger students as well. Until the pendulum swings back from the physical to a corresponding level in mental development, the colleges and universities will fail to turn out men of the same caliber and type as they did a decade in the past.

Donald Twalm,

Iowa State College, Class of 1923.

THE CHEAT WHO GOT BY

AS I shall be severely criticised by many undergraduates, I wish to state my view-point in advance. At the age of fifteen I quit school and went to work. A disability incurred in the service placed me back in school. I am now a sophomore in an engineering col-

lege, but I look at this question with the benefit of eleven years' experience with the man in the street.

When a college man thinks of sports, he thinks of the one real sport—football. Personally, I love the game, but common sense tells me that football is a decided menace to learning and development of worth-while character traits.

Every college has an alumni body. Most colleges have a graduate manager of athletics. This man's job is to keep tabs on the promising high school athlete and induce him to enter college. The alumni provide the funds, and from these funds the man's expenses are paid. He may or may not get spending money, but he does get his tuition and his living expenses. This man has his choice of the social fraternities; when candidates are selected for the honoraries, the football player is taken and the merely successful student is passed by. When other students are dropped, the football player is kept on. In extreme cases he will be dropped too, but this seldom occurs.

At the Christmas examinations one of our star half-backs was caught cheating. The penalty is dismissal. But this man's place next year cannot be filled easily. As a result he was placed on probation for one year by a Faculty committee who lacked the sand to fire him. Incidentally, a misguided student body fought hard against this man's dismissal and influenced the Faculty's decision.

This is not an exception. I don't have the space necessary to go into this matter further, but I want to say that the system is all wrong. Every college that I am personally acquainted with helps the athlete. If you say that they buy their players, you mortally offend them. They don't buy them; they just pay their expenses and give them a little pocket-money. I, personally, have friends in three of the large colleges who are getting a free education for their services on the ball field. I've con-

tributed to funds for this purpose myself, but I don't like the results from this system. It places a premium on athletics and knocks at the roots of a higher scholarship standing.

If a man makes good grades and happens to lead his class, then we say that he is a "grind" and we despise him. But is it right? An athlete is a campus idol; he makes all the honorary fraternities, and is lauded for what the profs call his leadership qualities. Ask any student. What counts—athletics or scholarship? It is athletics every time.

I'm a fraternity man myself, and I love football, but, although it is a great advertisement to any college, I'm against having a winning team at any cost. We are honoring the athlete and despising and belittling the successful student. But the colleges were built for learning, and learning and knowledge are the least prized things on the campus.

A heavy-weight championship prize-fight will draw sixty thousand people; so will a big football game; so will a war. Think it over.

Martin K. James,

A Pennsylvania Institution.

A PROGRAMME FOR ABOLISHING THE PROFESSIONAL SPIRIT

ENTIRELY too much emphasis has been placed recently upon the desire to win games and championships in inter-collegiate athletics. Such a feeling has developed a spirit of intense rivalry between different institutions, and this in turn has resulted in the commercializing of healthful sport. The larger universities have expended enormous sums of money for coaches, trainers, equipment, and stadia. The lust to win has spread so far that championship teams are sent across the continent to play single games. Such a trip not only involves a large sum of money, but takes the players away from their studies and detracts from the real incentive of college life. Here I ask, "Is this the aim of athletics in education?" The first intercollegiate game of football between Rutgers and Princeton was played for the pleasure derived from the contest. Now the aim seems to be anything but that.

Furthermore, this intense rivalry between schools has led in no small degree to the professionalizing of the college athlete. The alumni and others who are interested in athletics for the sake of winning games have paid the school expenses of star high school performers, and this has brought to our schools a type of undergraduate who is endowed with a different spirit than that which was prevalent in the past. A keenness to excel has been the cause of laxity in regard to scholarship and also in regard to eligibility rules in many colleges.

This professionalized rivalry has not only wormed its way into the morale of the players, but also among the students

and spectators who crowd the sidelines. The players are made a means to an end by many students, alumni, and other interested parties. Gambling has become prevalent, and respective teams are backed to the limit. Some no doubt think betting proves a man's college spirit, but if it is allowed to go on by the college authorities it will in the end cause the downfall of the truer feeling of clean sport for clean sport's sake. When a team loses under betting conditions, a spirit of animosity is always aroused, which is detrimental to the school. Players are severely criticised, and the coach loses his popularity and many times his position.

Therefore we see that the winning of games and championships, which seems to be the aim of the coach, players,

GUGLIELMO FERRERO

ORDER OR DISORDER?

BY

GUGLIELMO FERRERO

THE OUTLOOK will have the honor and pleasure of publishing in its next issue an article by the distinguished Italian historian, philosopher, and man of letters, Guglielmo Ferrero. As our readers know, Signor Ferrero is the author of one of the most noted and also most readable books of our time relating to the history of Rome, namely, "The Greatness and Decline of Rome."

The article will have the title "Order or Disorder?" It is a searching discussion of the conditions and dangers of European civilization under the stress of post-war conditions. It is admirably written and deserves the most careful consideration.

alumni, and undergraduate body at the present time, presents a serious problem. A spirit of rivalry is developed which has led to the commercializing and professionalizing of otherwise wholesome athletics. It has caused a laxity in scholarship standards and eligibility rules, all of which is undesirable in education. When coaches in some institutions receive higher salaries than the presidents of the same schools and manufacturing concerns present automobiles to the best players, then it is time that some plan of reconstruction be adopted.

My plan involves the following points:

1. Sever all connections with the alumni in regard to athletics.
2. Place all intercollegiate activities in charge of the college authorities through a department of physical education.
3. Place the financial side of athletics under the college treasurer with budget system;
 - (a) Limitation of gate receipts in relation to expenses;
 - (b) Do away with athletic scholarships.
4. Raise scholarship standards and enforce all eligibility rules.
5. Do away with seasonal coaches, spring football, summer camps, training tables, and lower the salaries of coaches.
6. Limit number of hours that a coach can require of players;
 - (a) Prevent coast trips and inter-sectional games.
7. Play different schools each year, thereby removing the tendency towards intense rivalry.
8. Form conference with these points in view.

ALFRED G. WHEELER,

Oberlin College, Class of 1922.

DISILLUSIONED, BUT—

I'M through with college athletics! For three years I've slaved, and strained, and sweated, on grid, and ice, and diamond. I've grinned at knocks and bruises. I've scoffed at pains and aches. I've bowed to censure and blame. I've sacrificed amusement and pleasure. I've denied myself smokes and eats. I've neglected studies and ambitions. I've subordinated all to sport.

And to what end? The love of Alma Mater—bunk! The respect of student and faculty—a vain hope! The praise of press and public—nothing to it! The satisfaction of personal desire—idle vanity!

Yet these are the things I strived for. And with what success? A collection of campus distinctions that are useless. A respect that amounts to nothing. A scholastic record that is abominable. A broken nose that is a reminder of my folly. A bunch of press clippings that contain more knocks than boosts. That's all.

What a miserable and stupid fool I've been! Why should I have been so willing to give of my strength and of my time, while hundreds of other students

sat back refusing even to raise their voices in a cheer of encouragement for the team that was representing them; while the Faculty looked on and did its best to flunk the men who were doing more to advertise and popularize the college than all the other agencies put together; while the public smirked in smug satisfaction at mere idle rumors of crookedness and professionalism; and while the college itself held up its hands in horror at the hint of a scholarship in lieu of services for the needy?

So I'm off athletics for good. I'm going out after a little joy in life. I'm going to do as I please, and eat what I like, and sleep when I feel like it—for a change. I'm going to get down to some real work. No more training quarters for me. I'm through.

I suppose I'll miss the old life of activity a little. That feeling of elation with which one responds to the first call for candidates. The satisfaction of being retained on the first squad. The glow of perfect physical condition. The pride of seeing one's name posted on the first team line-up. The thrill of the first game, with a thousand voices urging one on to greater effort. The flush of victory. The glory of having done one's best. The suppressed excitement with which one scans eagerly down the sports sheet to see what the writers have to say. The congratulations of one's fellow-students.

Yes, I shall certainly miss all these things. And how stupid it is to stand on the sidelines and watch others trying to play the game!

I hear they're up against it for material this year. No worth-while recruits, and some of the old chaps leaving. I was talking to the coach to-day. I didn't have the heart to tell him I'm quitting.

Gad, I wonder if I can quit! There's something about it that seems to hold right onto me. It gets into one's system. The sporting blood, I guess, and there's no beating it out. I've only got one more year of college. Aw, what's the use of trying to be a piker? I guess I wasn't built to grind into books, and go to the movies, and the cabaret, and out to parties, and all that sort of thing. The devil! I won't quit. Hurrah, I'm going out for the team again!

D. B. R.,

Columbia University, Class of 1923.

IMMIGRATION AND NATURALIZATION

BY JAMES J. DAVIS

UNITED STATES SECRETARY OF LABOR

IF I had the time, I should like nothing better than to study the histories of the nations and the races of the earth away back as far as our records of early civilization go. I should like still better to go beyond these records and help in the great research work that is still being done in an effort to bring to light the stories of primeval life and struggle for existence among the tribes of this old world of ours long before the oldest of the nations now existing boasted of a semblance of civilization. But I have been deprived of the opportunity of delving far even into the labyrinths of comparatively modern history.

Strange to say, I was prevented from learning a great deal of history as a boy because of the very fact that makes that subject so interesting for me—I was an immigrant boy. The struggle for a livelihood in a new country was so full of what some people call hardships, but what I call experience, that at an early age I was working as a puddler in a steel mill, contributing a small share toward keeping our family happy and contented.

I have no idea when it was that man first migrated from "the cradle of humanity." It is enough to say that it was a long time ago that men first felt the pinch for room and began to go out to seek new fortunes, bigger herds, and larger and greener pastures. They found wild beasts and barriers of mountains and of waters and forests. The more daring and courageous ventured far and found keen pleasure in the adventures of wild lands. Feats of strength and endurance were the pride of the leaders of their bands. And so it came about that the strong explored into far countries, set up their own kingdoms, and prospered, while the weaker of mind and body, the lazy and dependent, stayed behind, only moving when conditions in

JAMES J. DAVIS AS PRESIDENT OF THE AMALGAMATED ASSOCIATION OF IRON, STEEL, AND TIN WORKERS OF AMERICA, AT ELWOOD, INDIANA, AT TWENTY-ONE YEARS OF AGE

their old localities—crowding, scourges of disease and filth, or of exploitation of more ambitious hostile foes—forced them on in the direction the more energetic of their races had gone before.

One after another great pioneering nations have risen and fallen. We are all familiar enough with ancient and modern history to have heard of periods of Roman, Danish, Norwegian, Spanish, British, and other international conquests. Long before Christopher Columbus discovered America the Norwegians had been here, and before them, according to Chinese history, Buddhist priests had visited the coast of California as early as the fifth century.

Early immigration to every new country consisted of the very bravest, stanch-

est, and most loyal subjects or citizens of their mother countries. It was necessarily so, because of the great hardships and dangers of travel. It took courage to sail the viking ships of the Norsemen on their journeys of thousands of miles, battling the tempestuous northern seas of cold and ice, and strength to pull the oars they used.

It took the same courage and strength in the days of the Pilgrim settlers who came to our shores, but of still more importance in building the foundation for our advanced civilization was the strength of character which prompted their coming. Peace-loving, fearless, and conscientious, as well as strong physical beings, ready to battle for what they believed was right, strong in Christian faith—these were the people who began the work of construction of the greatest nation of the world. A greater love for liberty and a greater respect for the rights of individuals, together with a determination and willingness to endure the hardships of pioneer life, drew to America the very best blood of every nation of Europe.

Conditions of emigration to America have changed. No longer is ocean travel beset with danger and hardships nor sacrifice of wealth. Steamship travel is luxurious; the steerage of a steam liner even forty years ago was superior to many, many homes of the poorer classes of Europe; and this travel when the new immigration started became cheap—at times passage from Hamburg to Chicago has been offered as low as \$10 a person, and at this price any one could afford to travel.

Every inducement for emigration was offered: A big and new country, money to be had for the asking. It required very little work to become wealthy, as these peasants counted wealth, in America. At least such were the stories

circulated, and are even now being told in Europe.

Needless to say, the type of immigrants coming to America after the difficulties were removed and the thought of hardships eliminated changed, and they began to come in increasing numbers. To the European immigration was also added a large influx of Oriental life, until finally Congress found it necessary to place restriction upon immigration for the protection of American citizens.

First were barred Chinese laborers by prohibiting their immigration here for a period of ten years. Later Congress passed a permanent Oriental Exclusion Act, which prohibited immigration from certain prescribed areas of the earth's surface, and this Exclusion Law is in force to-day, its efficiency impaired somewhat by subterfuges resorted to for the purpose of violating the laws and the court decisions which have modified apparently the original intent of the law.

We excluded the Oriental because we believe that his lower standard of living, the low wages for which he was willing to work, would impair our own standards and the efficiency of our institutions. This was right; but no less correct was the attitude of our Congress in advocating and adopting certain standards of health to be required of all our immigrants. Experience has taught us that if we let into our country men and women physically incapable of self-support they become public charges. Sooner or later they drain upon the National or community wealth—they take everything and give nothing, while those really responsible, those who received what benefits they have conferred, or who would have received the benefits had there been any, are relieved of responsibility, and we pay the bill.

But it was not primarily the expense of keeping public charges we objected to. We feared a more serious menace—that from dangerous and loathsome contagious disease. Life in foreign lands among filth and dirt brought upon the countries of the Old World great plagues of typhus, cholera, leprosy, tuberculosis, and many other diseases.

The United States was a new and clean country, it was vast, and there was room for expansion, but to permit every disease of Europe and Asia to come in meant ruin. No one doubts the wisdom of our policy of weeding out the sick, the maimed, the halt, the blind, the imbecile, the feeble-minded, and those convicted of crimes.

But even with the selective system of immigration, by which process we weed out the defectives, there have come in many aliens undesirable for various reasons. Large numbers of nationals of certain countries have established themselves in communities, setting up their own standards and holding aloof from the institutions and facilities which work toward assimilation, preventing a thorough boiling of the melting-pot. Especially during very recent years has there been a noticeable clotting in the

SECRETARY DAVIS AND HIS LITTLE DAUGHTER, JEAN

boiling process. Either we have put too much in the pot or we have not stirred fast enough, but, at any rate, we have got to take out the lumps or break them up and smooth out the mass.

I attribute most of our difficulties to ignorance. We all know that the facilities for education in many of the countries of Europe are not what they might be. None of them equal the facilities offered in the United States to every person. In most States here it is compulsory that every child should be well grounded in fundamental subjects. I do not hesitate in saying that our high schools of to-day are equal, and perhaps superior, to many of the universities of only a few generations ago. There is a very large percentage of illiteracy in Europe, and of late years, and prior to the enactment of the Literacy Test Law, we drew heavily upon these illiterate classes. Lack of education breeds misunderstanding, and this misunderstanding is responsible for much of the strife, the civil war, and turmoil in social and industrial affairs all over the world.

As an illustration of how ignorance transplanted from Europe endangers our political and industrial life, I want to cite a case which was brought to my attention only recently. A Russian was about to be deported to his native land for the distribution of Anarchistic literature. He had a wife and several children, the children born in America. A delegation waited upon me and pleaded the hardship which this deportation would mean to the family. I immediately telegraphed to Washington for the records in the case. He spoke but a word or two of English, although he had been in America for eleven years. He had been convicted of spreading Anarchistic doctrines. In fact, he was the head and feet of a subdivision of a big Red organization. He made the statement at the time of his arrest that Russia had the ideal Government, and that

the Government of the United States ought to be overthrown and be made over just as the Russian had been. In other words, he would have us go through all the strife and civil war that that country has passed and is passing through! It would mean that our citizens would have no property rights and human life would be held at almost nothing. I said that it might be a hardship to this man's family, but not nearly so great a hardship as it would be for our country to allow him to carry on his Red activities here. There was nothing to prevent his taking his family to Russia if he wished, and if that country was so much better than ours, then he had the privilege of enjoying it. We as Americans want America to be governed as we want it. That is our privilege. If this man had only had the proper education, so that he could have understood a representative form of government, he might have been saved deportation, because undoubtedly he would have entered whole-heartedly into our scheme of things.

There are thousands of other aliens in the United States who are in just that same position. At present there are over 13,000,000 foreign-born whites here. Approximately 1,750,000 of those over ten years of age are illiterate.

Our present naturalization laws, with the addition of a few amendments added from time to time for the purpose of clarifying their provisions, were adopted in 1906. Prior to that time our naturalization system amounted to very little less than an international scandal. Citizenship could be bought or sold. It became almost a commodity to be purchased in the open market. The present laws have changed this to a large extent, and now we have an orderly, although I believe still inefficient, method of naturalizing foreigners. Since the enactment of the 1906 law nearly 1,500,000 foreign-born were naturalized. This

represented the clothing with citizenship of something over 3,000,000. At present there are well over 6,000,000 more who are eligible for citizenship.

There is no doubt in my mind that we should provide more and better facilities for educating and Americanizing the immigrant. We have too many unnaturalized foreigners here for their own and our good. We ought to teach them the meaning of citizenship and then give them a chance to qualify by properly educating them for the duties and privileges which that honor confers. There should be co-operation between our Naturalization Service and the public schools, a co-operation whereby one may know the needs of the other to the benefit of our foreign-born brother and sister who have come here, we must assume, for the purpose of becoming one of us. If, on the other hand, it is the intention of these aliens to take from us only, to tear down our institutions, wreck our Government, and assume none of the duties imposed upon us as citizens, then we do not want them.

There is only one way in which we can get behind this movement in an efficient manner, and that is to know who is the alien, where he is, and what he needs; and there is only one way in which we can properly survey the work—that is, by requiring each and every alien to report, or to enroll, at a specified time at a designated place and give us the necessary information to enable us intelligently to determine just what solvents we should place in our melting-pot and just how much fire it will take to boil it.

I have advocated this enrollment for a long time. I do so with a full knowledge of all that confronts the immigrant, for I was one of them. Under all the tests which we might give looking toward a sifting out or a selection of immigrants, whether in the United States or in Europe, we would be sure to get Red leaders from Europe, while thousands of hard-working, good, honest immigrants, capable of becoming real assets, would be barred. Education for citizenship by enlarging the Bureau of Naturalization in the Department of Labor so as to make it a Bureau of Citizenship will do more for the protection of America and the aid of the alien or immigrant than any other one thing that I know of.

The fact that immigration has changed—that the men now coming to us are not as hardy and determined as before—does not mean that they cannot become desirable citizens. They merely need more opportunity, a more definite programme for education and assistance in following it. The Bureau of Citizenship is the natural agency for the carrying out of such a programme, for citizenship means more than the legal process of naturalization.

The following editorial from the Chicago "Courier," a Jewish newspaper, indicates how the thinking foreign-born themselves feel toward a Government

THE HOUSE IN WHICH JAMES J. DAVIS WAS BORN, IN TREDEGAR, WALES

programme for educating immigrants and aliens:

OUR DUTY TOWARD THE IMMIGRANT

The present policy of our Government in the restriction of immigration has of course materially reduced the number of Jewish immigrants, yet immigration is still going on. In the pre-bellum days the admission of twelve or fifteen thousand Jewish immigrants monthly was an average record. At present only six or seven thousand Jewish immigrants land on our shores in the same period of time. The fact that Jewish immigration continues, though not on the old scale, imposes upon us certain definite duties. The experience of several decades should enable us to manage our immigration problem better than in previous years. The well-being of the immigrant and his future relationship with our institutions depends largely upon the character of the reception and aid we extend to him during the first few months after his landing. By showing him the right road and by enlightening him in the matter of his work, we direct him in the path of his welfare and future success.

The Americanization of the immigrant should begin the moment he sets foot on American soil. Tens of millions of dollars are spent annually

on domestic charities. One million dollars a year spent on the Americanization of the immigrant would not only save the latter from economic difficulties later on, but would actually save the millions spent on domestic charities for work of a more constructive and permanent character. Night schools for immigrants should be established in every Jewish community and attendance should be made compulsory as much as possible.

The major number of immigrants admitted to this country have to work for their living after landing. They must seek employment. Their employer sees that they do his work, but has no concern as to whether the immigrant is making progress in other matters. This is a short-sighted point of view, for we do not live by bread alone, and the employers' own welfare is dependent upon the general welfare of the Nation and the full appreciation by all people of the character of American institutions. No matter how skilled in his own line of work the employee may become, the employer must realize the fact that a knowledge of the English language would make for a better production and thus for a greater demand of the product. If any employer should fail to realize this essential of the Americanization of the immigrants, it is possible for the Government to bring pressure to bear on them to make each job of the immigrant employees dependent on attendance of night school. If necessary, Congress could enact a law imposing upon the employer the duty to see to it that his immigrant employees attend night school for a certain definite time.

We must establish plenty of night schools for immigrants and compel them to attend them. The immigrant might perhaps consider this coercion. But what if he does? Children consider vaccination coercion and sometimes school attendance as well, but since these are good things for the child, we compel the child to accept our decision in the matter. After all, a grown-up man or woman need not be coerced, but only persuaded. From his point of view, as well as from the American point of view, the sooner the immigrant knows our language and our institutions and becomes an American, the better for him and the better for America.

The first essential in educating for citizenship is the teaching of English. The alien cannot understand America until he understands her language. Neither can the American understand the alien, because he has no means of communicating with him. They live apart. Only by knowing English can the alien understand his job. He becomes more efficient by being able to understand the instructions and orders given to him. Accidents are fewer for the same reason, so that this knowledge is a kind of insurance.

It also opens greater opportunities for industrial and commercial advancement, for only by knowing what is going on about him can one take advantage of the many opportunities presented to

him. In all our large cities educational advantages are offered for the learning of new trades or improving the one which a worker has already selected for his life's work. The Y. M. C. A., Knights of Columbus, and other private organizations, and even the public schools, carry on this work so that the instruction may be obtained after the regular hours of labor and at such a small cost that practically every one can afford it. But unless the alien intelligently understands English, this opportunity for self-help is denied him.

The material benefit which comes from knowing English is not the only one secured. Many nationalities with different tongues make up the population of the United States. Under Old World conditions, there are national hatreds one for another, and these are not left behind when the immigrant leaves his home. How can a changed heart come unless they all speak a common language, the language of the country of whose citizenship they desire to become a part? All the old hatreds and misunderstandings, to my mind, were largely due to lack of a common means of communication. Unless this obstacle is removed there is bound to be friction here as well as there.

We do not need to worry so much about the children of the aliens, who by our laws are compelled to go to school and acquire an education. Our problem is largely with the adult alien. The child will eventually be absorbed, because we compel him to learn our language, our ideals, our institutions, and prepare him in that way for the duties of citizenship.

And this brings a new danger—the danger of estranging the child from the parent. Unfortunately, not all of the younger generation have that feeling for parents which should make them honor and respect their mothers and fathers, uncouth and ignorant, after they themselves have secured an Ameri-

THE HOUSE IN WHICH JAMES J. DAVIS LIVED AT SHARON, PENNSYLVANIA

can education with all the refinement which goes with it.

And the adult should feel the responsibility toward the child. His lack of an education makes it more difficult for the children to learn their lessons at school. It puts an added burden upon them in their play as well as their work. How often we hear the slurs of American children against their fellow-pupils and playmates because of the ignorance of their parents! We ought to put them all in a class and give the parents the chance which they have never had to enjoy the privileges of an education. They came to this country in search of something better. The more we can give them, the more we will get in return. The English language is the basis for all of this.

As Secretary of Labor, I am called upon in many, many cases to try to effect settlements in industrial disputes. Last year there were more than 460 such cases brought to me, so that I have had a great opportunity to observe the causes of industrial warfare. One of the noticeable factors, I find, is the ignorance of the alien workmen in industry. There are more difficulties to adjust where they are employed, and in analyz-

ing the situation I attribute most of them to lack of understanding, not only of our language and of the conditions of employment, but also of the institutions of our Government. You cannot blame these men, for they never had the opportunity of learning the fundamentals of economic law. Many of them can neither read nor write, and under these conditions no other result can be expected.

Our great problem, then, is to educate the alien, and I believe that in the majority of cases the alien is not only anxious to use facilities for education if they are given him, but is also willing and able to pay for the privilege; and so I say, enroll every alien. Charge every wage-earner a small fee and provide the very best advantages of education for him. Then let our citizenship officers give each alien a card which he should present periodically for notations as to the progress made in his studies as well as his character and conduct in the community. At the time of the enrollment the officer will direct him to the proper school and see that he gets the proper training through the educational authorities.

Under the immigration laws, the immigration authorities take into custody for deportation such aliens as become public charges within five years after their entry into this country. Many of the aliens are in hazardous employment. The wage-earner may become totally disabled, killed, or perhaps die of disease, leaving a family deportable under our laws. It strikes me that it would be far better if a part of the fund collected from the alien through enrollment were to be used for the purpose of taking care of these dependents rather than deporting them to the countries from which they came. I would like to see this done, because I know how the father undoubtedly felt when he came here; that he came in order that his family might have the benefit of the opportunities here in our country not offered in his own. He came, not only for his personal enjoyment of our political life, but for the advantages which were held out for his family. Surely he would be glad of the opportunity to invest in that type of insurance which would provide facilities for taking care of his family should

PEDDLING FURNACE "DRAWING A HEAT." MR. DAVIS ONCE WORKED IN SUCH A MILL

they be likely to become public charges. With this money we could, if necessary, pay for their keep or build large homes and schools to take care of these people. They would be under our direction and we would know that the potential citizens there raised would be fully qualified for the privilege of citizenship which they seek.

Another very important feature of the enrollment of aliens is in the administration of the naturalization laws. Under the present law, when a declarant proves up on his petition, he must produce two witnesses who have known him for five years and can testify as to his character and fitness. That is a provision which is exceedingly difficult for many aliens to comply with. Often the alien's employment carries him from one jurisdiction to another, or perhaps the moving of those about him makes it impossible to secure a satisfactory witness for many, many years. When he can, in many cases it is at great expense. Under the enrollment plan, a

certificate of enrollment with notation upon its face could be used as a substitute for the two witnesses and would certainly facilitate final action on citizenship petitions.

When the petitioner receives his final certificate of citizenship, he will come into court and demonstrate his knowledge of the country and our Government. He will speak English, and understand those about him. The court session will be impressive, and turned into what we term in fraternal societies a testimonial meeting, and each one will give a testimonial of what citizenship will mean to him, and what he will do to further the good of the cause. These meetings will be highly inspirational, and will do much to place citizenship upon a higher plane.

In the old days of the Roman civilization no greater honor could be conferred upon a man than to make him a citizen of Rome. Is our own country any less great than Rome or should it be any less an honor for a foreign-born person to be

granted the privilege of American citizenship than was the privilege of Roman citizenship centuries ago? Let every safeguard be put upon it.

I have heard some opposition to the enrollment features provided for in the Naturalization Law which is now pending in Congress. The radical papers and radical leaders oppose it. Other foreign-language papers and foreign leaders have heartily indorsed the plan, which goes to show that this new method of Americanization and naturalization will do more for the country than merely confer citizenship upon foreign-born people. The immigrant who comes here with a purpose of becoming one of us, abiding by our laws and contributing to our welfare as well as his own, will find the new law of vast benefit to him. The Red leader and the Anarchist will find in it only Governmental protective machinery to thwart his plans for alienizing America. Our whole purpose must be to Americanize the alien before the alien alienizes America.

AND NOW THE FLAPPER TEACHER

BY ANGELA M. KEYES

THIS is the day of the flapper and the period of after the war; more particularly and significantly, after the Great War. It is a strongly marked period, like and radically different from other after-the-war times, just as the recent war, the Great War, was like yet frightfully different from other wars. It is natural that social manners and ways should undergo an upheaval, that society itself, its men and women, but more particularly its boys and girls, should react in astonishing if not alarming forms of outlook and conduct. It was their only slightly older brothers and sisters that played the chief part in the war; it was their impressionable young souls that were shocked with the spectacle of the ruin of order, decency, the apparent insignificance of human life, the wholesale destruction of beauty, use, genius. It is natural that they should be thrown off their base, and should develop a recklessness, a worldliness, a disregard for custom and convention, that amazes and disturbs their elders.

For the elders too have been changed by the Great War. Them too it has given a new scale of values, and it is well that, on the whole, it is a better scale. If it had not deepened and spiritualized the elders, the youngsters might justify their defiance. It has deepened the meaning of life for the elders, but without disturbing for them the importance of certain outward codes or conventions. They do not always recognize that the youngsters too have caught a glimpse of life so clear, so terrifying, that they shut it from their eyes with gayer dress and from their

ears with louder jazz. So the two groups repel and misunderstand each other. The more rabid of the youngsters turn themselves into flappers and pronounce as out and out frumps the more hopeless of their elders.

Some of the flappers are attracted by the profession of teaching and are entering the city's training schools for teachers. History repeats itself. The training school and the flapper will modify each other. Will it be for good or for ill?

The training schools are receiving the flapper cordially. They are wisely shutting their eyes to her extravagances and crudities. For the Great War has taught the schools and the experienced teacher perhaps more than it has taught the mother or father. The school, which has developed from its work a more reflective habit, accounts more easily for the present "hectic" state of society than does the home and is less alarmed at it. So it does not make too much of the wild bob, the short skirt, even the ugly flesh-colored stockings.

The flapper has brought into the serious, often over-weary, sometimes all but discouraged, training schools of our crowded cities vigor, daring, directness, and withal unmistakable braininess, fine practical ability. She has brought back hope itself. Why look too curiously at her outer aspect? Why listen too critically to her dialogue? Why lift the eyebrows or draw down the lips at her manners? No, the wily training schools are biding their time, but for the present they are engaged chiefly in sunning themselves in her care-free gayety and relaxing their tension in her zestful teachableness.

The flapper will make a good teacher. She is abler than her predecessor of a decade ago. She has been startled into a more alert and vigorous mentality. She is stronger and more active physically. She is less given to hysteria. Suffrage and war need have emancipated her. She has gone to excess in some directions; but in the history of this very imperfect world who has used new freedom with entire wisdom?

The student of teaching to-day is better educated and trained than was her more ladylike elder sister of a decade ago. She knows more history, geography, literature, social science. She is, in fact, a return to the classics, though this change she would repudiate hotly, her idea of being well educated, whether she hails from England or America, being to be well grounded in the great English tongue and well steeped in the great English literature rather than befuddled with a smattering of Greek and Latin.

I mean a return to the classics in another sense. In the days of Æsop, the pedagogue was the learned man of the community. The day is not far distant when every teacher of even the smallest children will be a college graduate; Virginia already requires that her teachers shall be full-fledged bachelors. This will mean, not only a fuller and more accurate scholarship, but a greater maturity in the inexperienced teacher.

To-day's graduate of the training school will know more, too, about children and teaching them. The flapper is doing more scientifically than ever what old Plato hundreds of years ago suggested should be done before laying

down courses of study and dogmatizing about methods of teaching. She is studying the pupil at first hand. And she is really getting together a lot of sound first-hand information and making intelligent use of it in her practice teaching. She is taking heartily to the scientific doctrine that a teacher must constantly watch the reactions of her pupils and must keep abreast of the best pedagogical thought. She reads more of the pedagogical literature, direct and indirect, than did her amiable predecessor. She belongs to teacher clubs; she identifies herself more openly with her profession. This is all the fruit of her expanding outlook on life; she learns that to be constructively useful is at least as desirable as to be ornamental.

In my opinion, the anxious parent and the thrifty taxpayer, looking to the provident outlay of his money in terms of the flapper's coming salary, may sleep o' nights.

"But," say the indignant taxpayers in chorus, "what about her rôle of model to the child? Let her remember that as a teacher she will not be a free agent."

There's the rub. This D'Artagnan, Joe Brooksy, swaggering young person knocking, or rather merely walking in without the ceremony, is but making a gesture of protest before toning down her liberty.

Do not fear; she will tone down. A very few years in New York City's crowded class-rooms will dull her bright plumage. And that she will still remain of her period, O taxpayer, is all to the good for Young Hopeful. She will sympathize with him all the more.

Flapper or not, the modern student of education is really making a good job of learning to teach. If Sammy Bernstein should go to pieces in her spelling class when writing a letter, after he has netted a hundred per cent in a column of words test, she doesn't stay in after school to see that Sammy spells each word a hundred times, each time more incorrectly than the preceding. Nor does Sammy. Oh, no! She intends that both shall go out into the sunshine on schedule time. She may breeze into the class-room like a boy, but she understands what is meant by functional standards of teaching and she tries to live up to them by training her pupils to spell in the process of composing a letter, to talk on their feet, to speak distinctly and healthfully, to practice community civics. Her pupils hailing from crowded tenements do keep the fire-escape free from left-over food that should be in the ice-box, and they do come to school with shining morning faces from a liberal application of soap. She may wear red earrings for a week after the "long wake," but she knows how to arouse the purposeful self-activity of the learner, how to form and use the apperceptive mass when teaching seventh-year boys to thrill when Lincoln's Gettysburg Address.

And for all the taxpayer's anxiety about it, the flapper teachers are every

"SIMPLY FLAPPERISH"

bit as strong on the Ten Commandments as their predecessors. Honor thy father and thy mother? Well, I should say so. Listen to Miss Teacher-To-Be Flapper Student practicing opening school in the year of grace 1922:

"I hope that every boy in this class helped his mother before coming to school this morning. You need not tell me whether you did or not." Here the pious one of twenty years ago would have instituted an orgy of fibbing. "John Patullo, I shall be ashamed of you if you did not carry up coal enough to keep your poor sick mother warm this cold day. Give her my love and tell her I am coming to see her Wednesday afternoon."

Yes, I think the main chance will be as safe in the hands of the flapper of

to-day at whose feet your adoring children will sit, dear taxpayer, as it was before the war. The flapper teacher-to-be is young, she is breezy, she is even risky in attire; but she has scrapped hysterics and the vapors and, believe me who live with her, she is sound at the core.

As for my contention that she is a better practitioner of the art of teaching, "I trust," said a recent writer, "now that teaching is becoming a science, they will take it out of the hands of giggling girls of eighteen." They have. The flappers of 1922 have. They have taken it into their own capable hands. And they are not giggling. But how would you describe them? Are they boyish? mannish? No; they are simply flapperish.

EGGS THAT KEEP WITHOUT BLOWING

PEWEE'S NEST

BROWN THRASHER'S NEST IN A HAWTHORN BUSH

ROBIN REDBREAST'S NEST

Boys with an instinct for the joys of the naturalist's vocation formerly took delight in robbing birds' nests of their eggs. They may now get equal joy for themselves, while leaving the eggs to their rightful owners, by going photograph-hunting for the eggs. To do this successfully requires a camera with a ground-glass back, so that the nest and eggs may be properly focused. Various inexpensive forms of this kind of camera may be obtained. With such a camera, a tripod, a box of plates or a film-pack, and a focusing cloth, the amateur is equipped for starting an interesting collection of birds to be.

Photographs from G. D. Smith, Richmond, Ky.

THE BOOK TABLE

NEW NOVELS AND CLEVER TALES

IT is always a pleasure to recognize distinction of manner in writing, and when the writer is new to the field of fiction the reader's feeling is one of gratified surprise also; for it is a quality rarely found in the hurly-burly or machine-gun fire of current fiction. Mr. Jay William Hudson, the author of "Abbé Pierre,"¹ is, like his Abbé, a professor of philosophy. Evidently also he is a kindly observer and quiet lover of human nature—again like his Abbé. Indeed, one of the noteworthy things about this romance is that author and imaginary narrator are inseparable in the reader's mind; as one reads along he becomes unconscious of the artifice of fiction and for the time feels that he is listening to a real Abbé Pierre. With him as guide and through his friendly comment and description, we see the little Gascon village where the modest, gentle abbé lives in his childhood home; we enjoy with him the charming gardens and the picturesque beauty of southern France; we join in his love of quaint old customs and legends; we spend a happy hour with him among his ancient books; we listen with him to "the clatter of wooden shoes on the hard, white road outside, or a peasant rattling by with his ox cart, or children driving by, their cows and geese;" we appreciate his wise optimism and his keen-witted comment; we follow with him the simple, happy romance of the charming village girl and the young American poet, whose cheerful brusqueness first startles the professor, but whose manliness soon gains his respect. The little story is as perfect a piece of workmanship as we have had for many a long day. It gains our affection by its honest simplicity, its ever-present but restrained humor, and its unobtrusive sentiment—not sentimentalism. It shows once more that romance and reality are no more opposed in fiction than they are in life; or, as Don Marquis said the other day in his column, "What we currently term realism is an effort to get into touch with a deeper or more fundamental romance; a romance acceptable to minds that have progressed beyond the age of twelve—it is that or it is nothing. Too often, as you were about to say. . ."

When in Mr. Wells's new story, "The Secret Places of the Heart,"² Sir Richmond Hardy enters the office of Dr. Martineau and is told that his trouble is that the current of his thoughts is fermenting, not mere fatigue, and when we learn that Dr. Martineau aspires to be the psychologist of the New Age and is an adept at psychoanalyzing the psychoanalysts, the reader is a bit ap-

JAY WILLIAM HUDSON

prehensive. But he cheers up when the doctor prescribes "peripatetic treatment," a simple motor-car tour through English byways with the doctor as guide, philosopher, and friend. Mr. Wells out of doors is always a delight. "We could talk on the road, in the evenings by the wayside." And they do talk—of the new philosophy, of individual responsibility, of collective action for the world's future, and (much the best) of what they see. The talk is good talk—not an open attempt to convert one to social theories, but with much human give and take. They go to places bound up with early British history—Avebury, Sudbury, Stonehenge—all mystically suggestive of progress from the prehistoric to the present and of questions as to the New Age. All this is enjoyable in movement and description. It reminds one of the days when Mr. Wells wrote "Wheels of Chance" and other stories redolent of English country charm.

But when Sir Richmond meets most unconventionally a beautiful young American woman as much interested for the moment as he is in the significance of ancient British archaeology, he forgets his proposed "treatment," lets the indignant doctor return to his patients, and becomes more interested in the girl than in his deep-set conviction of the world's need of a Permanent Fuel Commission, or in his wife, or in his mistress and her child. For as regards personal conduct Sir Richmond is apparently quite devoid of any drive of conscience or any sense of his cruelty to those whom he should protect. His sudden death ends but does not solve his problems.

Is Sir Richmond meant to represent a modern type of forceful man? Rather, perhaps, Mr. Wells has been captivated with the idea of showing what contra-

dictory strands of nature can easily and consistently coexist in one man. Sir Richmond is tremendously earnest in his wrath at his fellow-men because they will not see that they must work and plan for mankind's future, yet he cares nothing whatever for the unhappiness of those dependent on him. He knows his inconsistency, he rages and fumes about life as "a tangle of accumulations," and attributes his own indecision to "tangled heredity." He almost beats the doctor at philosophizing. But his temper is beyond control, his power of work blazes and fags alternately, and when the American lady meets his vision at Stonehenge, work, world's future, and plain human duty cease to exist. One strongly suspects that in this story Mr. Wells's heart is more in the dramatic depiction of this one inconsistent but tremendously real and vital person than it is in any theory whatsoever—psychic, social, or moral.

Mrs. Seymour's "Intrusion"³ has added to the reputation earned by her last year's book, "Invisible Tides." It is not a happy book, but even as the reader resents the ruin wrought by one brainless girl, vulgar, ignorant, sexually cold but avidly eager for men's admiration, he admits that "Bobbie" is painted with exactness and searching realism. We hate her and understand her perfectly. Equal care is taken with Allan, the man she hypnotizes and marries, something in the way, as we used to be told, the snake hypnotizes the bird—only in this case the bird knows what is happening to him and hates himself for yielding to the charm. The reader balks at the idea that just sexual attraction can avail against the knowledge, taste, and culture of a man like Allan; it doesn't blind him at all; he knows his utter folly; he is infected as with a disease germ. But the reader, balk as he may, admits that Allan also is made consistent. Bobbie's "intrusion" into the circle of Allan's intellectual family cuts a deep gash (worse than most war losses), for three of its members fall victims in one way or another. She dashes in for shelter in a rainstorm with a casual young officer who promptly disappears from the tale, and in the end the "intrusion" becomes a deadly invasion. Apart from Bobbie and Allan, the characters are a little sketchy, as if they had walked in a while from one of Rose Macaulay's novels to talk cleverly and vanish. The book is decidedly well written and it is the reverse of being tedious, but perhaps one gets a little too much of sex attraction as an unavoidable contagion.

Mr. Dodd's "Lilia Chenoworth"⁴ is an advance on his "Book of Susan" in that

¹Abbé Pierre. By Jay William Hudson. D. Appleton & Co., New York. \$2.

²The Secret Places of the Heart. By H. G. Wells. The Macmillan Company, New York. \$1.75.

(C) S. O. Hoppé
BEATRICE KEAN SEYMOUR

it has more plausibility and depth of character without losing the liveliness of dialogue and quick-moving incident that made the Susan book such good reading. Much care and pains have been taken here with Lilia herself and with the college professor who is her very imperfect admirer, but, agreeing that their portrayal is sound art, I, for one, delight more in the minor characters. How true and enjoyable are the President of the woman's college where Lilia makes such a stir and the New England woman who boards Lilia's professor lover! The story is capital reading up to the *dénouement*; then there is a feeling of disappointment, not at all because the ending is unhappy in the

conventional sense, but because, when the tragedy comes, it follows too closely upon a tragic-ridiculous incident and because it is too elaborately precluded.

Mr. Booth Tarkington has just gained a second time the prize of the Columbia University Pulitzer School of Journalism for the novel of the year that best presents "the wholesome atmosphere of American life and the highest standard of American manners and manhood." The present award is for Mr. Tarkington's "Alice Adams;" the former award was for his "The Magnificent Ambersons." If any one hasn't read both of these stories, he or she will do well to include it or them in the vacation kit. And it will not make said kit heavier, but lighter, to add to it Mr. Tarkington's just-published "Gentle Julia"⁵—with whom are thrown in the not so gentle and quite a little younger Herbert and Florence. I cannot possibly improve on what the publishers say of Julia: "Gentle Julia" is not in the 'Alice Adams' manner—not a 'serious book' in the solemn sense of 'serious'; not a book to be taken as succeeding 'Alice Adams' in intentional gravity. It might be characterized as a story of exuberant and irrepressible youth."

This is the time of year when "light summer reading" is in demand. Wabbly, gushy, sentimental, or hectic stories aren't really light; they are just stupid. But there are tales which are non-introspective and non-ultra-modern that are good fun and well done. Here are three that I have just enjoyed: "Through the Shadows," by Cyril Alington (Macmillan). It is farce, but clever farce;

⁵ Gentle Julia. By Booth Tarkington. Doubleday, Page & Co., Garden City. \$1.75.

LEE WILSON DODD

its plot is pretty shaky at the end, but one reads for the laughs and not for the plot. "Happy Rascals," by F. M. Howard (Dutton). Mr. Howard seems to have borrowed Mr. W. W. Jacobs's mantle; his sailors are just what the title says; the vendetta between the crews of two schooners involves deep scheming and ends in deep potations. "Men of Affairs," by Roland Pertwee (Knopf). It is not at all the usual murder and detective combination; the events turn around the efforts of a man to get out of London and reach unobserved a huge deposit of radium he has located. Here, contrary to most plot tales, not the reader but the opposing plotters are mystified; the book is a foreordained big seller.

HISTORY AND POLITICAL ECONOMY MEXICO ON THE VERGE. By E. J. Dillon. The George H. Doran Company, New York. \$3.

TRADING WITH MEXICO. By Wallace Thompson. Dodd, Mead & Co., New York. \$2.

MEXICO AND ITS RECONSTRUCTION. By Chester Lloyd Jones. D. Appleton & Co., New York. \$3.50.

Here are three notable volumes on Mexico. Dr. Dillon's book is the most vivid and pungent, and therefore appears the most readable of the three, but its manner is pontifical and its conclusions are sometimes remarkable. For instance:

President Wilson's moral scruples on the subject of Huerta doubtless do him credit, but the foreign policy of a great people cannot be usefully carried on by mere scruples and intentions. Nor is that all. Even those admirers of Mr. Wilson who approved that particular act must admit that it is wholly out of keeping with other moves of his, and also with the measures and utterances of his successor.

Secretary Hughes, on the other hand, "is understood to be ready to recognize any Mexican Government whatsoever, provided it will sign his pet treaty and bow to the god of private property." He

is an "upright public worker," Dr. Dillon graciously concedes, but—

While hoping to further American interests, which he appears to have partly identified with those of the oil corporations, Mr. Hughes has failed to take due account of those of humanity at large which occupy such a prominent place in his public utterances.

Far less personal than this author are Mr. Thompson and Mr. Jones. What Mr. Thompson tells us about Mexican resources or needs does not impress us so much as does his emphasis on the secrets of Mexican governments, the predatory *caciques*, and the horrors of Mexican degeneracy. His is a painful story of graft, greed, ignorance, and the application of political remedies for economic ills. His own remedy lies in a co-operation by the business men of America and Mexico. His book is readable, practical, and to the point.

Mr. Jones finds that if Mexico's political power does not rest in the hands of some new dictator it must lie in the hands of a small but widening group, which, with or without foreign aid, will undertake to prepare the people for

the responsibilities of self-government. Hitherto orderly government there has meant one-man rule. Henceforth, if Mexico is to work out her own political salvation, responsibility must rest on that small class which, by its education, social position, and wealth, is free from the limitations that surround the electorate as a whole.

TWENTY-ONE DEMANDS (THE): JAPAN VERSUS CHINA. By G. Zay Wood. The Fleming H. Revell Company, New York. \$2.

CHINO-JAPANESE TREATIES OF MAY 25TH, 1915 (THE). By G. Zay Wood. The Fleming H. Revell Company, New York. \$2.

CHINA, THE UNITED STATES, AND THE ANGLO-JAPANESE ALLIANCE. By G. Zay Wood. The Fleming H. Revell Company, New York. \$2.

In spite of their detail, in these three little volumes there is in compact form much information concerning the recent relations between China and Japan. It covers a period during which Japanese statesmanship committed some of its worst blunders and Chinese statesmanship was feeble and helpless. The tone of the books is one of suspicion of Japanese aims. The lack of indexes is a serious blemish.

So great and extraordinary a strain has been imposed upon human eyesight by the pressure of modern life that thirty-four out of every hundred adults in large cities are found to wear glasses all or part of the time

GUARDING THE EYESIGHT OF THE WORLD

BY NEWTON FUESSLE

EVERY seat in the club car of the Congressional Limited was taken when the train pulled out of Washington. Among the last of the passengers to get aboard was a foreign diplomat; he was to deliver an address that night in New York, and counted on the five hours' journey to put the final polish on his manuscript. A half-hour's smoke, and he would be ready for the task.

Passing through the club car, he stepped onto the observation platform, where he found a camp-chair vacant. But ill luck lay in wait. A sudden gust of wind and a forty-mile swerve round a curve cost him his eye-glasses. Fifty feet down the track they struck and splintered.

During his entire career this diplomat had been expounding preparedness, but here he was caught unprepared. For he carried no duplicate pair of glasses.

Retreating to the interior of the car, he was at once recognized and was soon surrounded by a sympathetic group.

"If your Excellency will pardon me," said one of the group, "I should like to make a suggestion. Why don't you wire from Baltimore to your oculist in Washington? Request him to wire your prescription to a New York optician, asking him to fill it and to deliver the glasses to you by the station-master when you arrive in New York. Have your oculist wire you at Philadelphia if the plan is feasible."

"Is it possible that this might really be done?" demanded the foreigner in amazement.

"I think so, your Excellency," smiled the other confidently. He was an optical specialist, and was not given to guess-work.

The story of the distinguished traveler's misfortune and of the novel project to overcome it ran through the car. There was eager speculation as to the outcome. And when, at Philadelphia, a

telegram was delivered which read, "Your glasses will be at Pennsylvania Station as requested," everybody looked happy and relieved.

"Ah, you Americans!" said the diplomat, wringing the hand of the man who had made the fortunate suggestion. "In my country such resourcefulness would never have been thought of."

A score of conversations had in the meantime been turned loose on the subject of glasses. Comment turned to the number of men in the car who were wearing glasses—twenty-one out of thirty. The men discussed the reasons for the greatly increased wearing of glasses over ten or twenty years ago. Human eyesight and the effects of strenuous modern life upon it were thoroughly aired until the train pulled into New York.

It was brought out that there were more children in the schools, and that they were spending more years in school than previously, with more strain and injury to eyes resulting from study. More people than ever before were engaged in closer tasks at office desks and machines. The nervous, fast-moving character of modern life seemed to affect the eyesight. Food was probably deficient in the vital elements needed by the nerves and tissues of the eye. The abrupt changes of illumination due to the general use and misuse of electric lights were cited. The tax of motion pictures on eyesight was argued. Some one explained that there was a rapidly growing understanding of visual defects and weaknesses, instead of the neglect of eyes that was so general in the past. Another cited the steady increase of competent optical specialists, not only in the cities but in small towns.

Views were fired back and forth in lively fashion, and interest in the diplomat's mishap and its happy outcome drew a curious group trailing after

Scientists in the Wellsworth plant have contributed largely during the past twenty years to the world's knowledge of how to discover and correct the errors in team work of a pair of eyes

him on the train's arrival to see him receive a small package from the station-master.

THE DIRECTING BRAINS OF THE NEW WIDESPREAD USE OF GLASSES

It is estimated that one person out of every four in this country over five years of age wears glasses, and that 1,704,000 children wear them. It is estimated, moreover, that two people out of four who now wear glasses ought to have their present glasses changed.

The present enormous prevalence of glasses and the skill and exactness with which eyesight specialists everywhere are able to discover and measure the needs of eyes and to provide the correction could not just have happened.

Lodged in the green hills of Massachusetts stands an old and important fortress. It is a fortress of science and industry. Its guns keep up a heavy and continuous fire and their range is world-wide. They are interposing a vast, protective barrage of glass between the world's eyes and the destructive strain that assails them.

This industrial fortress is the Wellsworth plant. It leads the world in output of eye-glass lenses, frames, and optical machinery. But the world cares less about who leads in quantity output than it does about who leads the way to beneficial discoveries and inventions.

Lodged in the green hills of Massachusetts, stands an old fortress dedicated to science and industry—the Wellsworth plant

That kind of leadership is what I hope to bring out to readers just as I saw it and learned it. The location of this plant at Southbridge is peculiarly appropriate to its tasks. The skies above it are smokeless, and every approach to Southbridge is over roads that wind past hemlocks, pines, and mountain laurel, past rivers and glistening lakes, through luminous air, fragrant with leaves and bark and rugged earth.

The importance of this New England plant to the mentality, nerves, and comfort of the world is literally beyond computation. It has laid multitudinous tracks of clarified sight and perception that penetrate every realm of recorded knowledge. Reverent eyes that labor in the library of the Vatican, genius toiling over its manuscripts, *savants* scrutinizing the progress of their experiments in the laboratories—six out of ten of all these, and six out of ten of all eyes that wear glasses, are indebted for better sight to the American Optical Company.

So quietly and unobtrusively has this institution carried on its work that, although it was founded in 1833, and was the first firm to manufacture spectacles in this country, the public knows but little about its researches or its momentous contributions to the welfare of the human machine. Even the specialists who prescribe and dispense these lenses and frames at the rate of one million pairs each month have been kept so busy looking after their cus-

tomers' needs that but few of these specialists have had time to visit the place where their materials are made and to watch the dramatic production of their wares. For out of a seeming welter of fire and pitch and earth, out of the red twilight of the polishing rooms, out of an ordeal that has hugely taxed human ingenuity, spring the gleaming, perfect lenses and the delicate parts which support them before the eyes.

This fascinating plant is the center and headquarters of the world's knowledge of optics. It has contributed largely to the improvement during the last twenty years of the knowledge, skill, and equipment of the profession. It has enabled eyesight specialists to discover and correct the real errors in team-work of a pair of eyes to a degree that has at last come very near to perfection.

"SLIPPERS" AND "LOUNGING ROBES" FOR THE EYES

The eye is the most delicate motor apparatus of the human body, and yet its muscles are subjected to a degree of abuse that no one would think of inflicting even upon his feet.

When Nature rolled up her cosmic sleeves and made human eyes, she designed the mechanism and arranged its delicate adjustments for the requirements of primitive outdoor life. That

kind of life prevailed on the planet for so many thousands of years that the abrupt modern migration of the majority of the race to desks and work-benches has imposed close-range tasks upon eyes for which they are neither built nor adapted. Conditions of life have undergone great upheavals, but the eye has remained essentially unchanged. To adapt the eye to the strange, new requirements causes strain which, although unfelt, often ends in poor vision and poor health. Optical science has labored unremittingly to provide help in this modern emergency.

If the normal eye tax upon the mysterious force known as nervous energy consumes one-half of the total supply, then consider the surtax that is levied by incorrect eyesight. Even as little as one diopter of error of eyesight is computed to cause a wastage of twenty-five per cent of the entire nervous energy of the human body. Half of the people of the country are blundering along with uncorrected or improperly corrected eyesight, and are therefore wasting twenty-five per cent of their nervous capital. It is as if one spent four dollars every time one should be spending three dollars. This wastage drains energy away from the heart, the stomach, the brain, and from the entire muscular mechanism. It causes a terrific amount of fatigue and harm, and ninety per cent of all headaches. Its usurpation of man's allotted amount of nervous energy

In one building alone, daylight through two and one-half acres of glass illuminates the work of grinding, polishing, and inspecting lenses

The predominating colors on the work-benches are crystal and gold

often causes neuritis and severe indigestion and probably shortens life itself.

Thus the therapeutic value of the right pair of glasses is very great, since it restores the flow of nervous energy into its natural channels. Digestive disturbances, hysteria, vertigo, and St. Vitus's dance have often been remedied or relieved by glasses.

New and amazing evidence of the physiological benefits of correct eye-glasses is piling up every day. Epilepsy in its early stages has been relieved and diminished by proper glasses.

We are a neurasthenic nation because we don't know how to relax. We put slippers on our feet and lounging robes on our backs for the sake of comfort and relaxation, but most of us do nothing to relax our eyes after the strain of the day's work. Yet there are "slippers" and "lounging robes" for the eyes, and even eyes free from serious optical error are learning the value of occasionally wearing "comfort glasses" to rest them.

FROM EMPEROR NERO
TO GEORGE W. WELLS

As far back as ancient Babylon and China it had begun to dawn upon mankind that eyesight might perhaps be aided by artificial means; and from that time on students of natural sciences have little by little been digging out of the unknown and piecing together stray fragments of the science of optics and the art of spectacle-making. Emperor Nero, who was near-sighted, watched his gladiators through an emerald, and thus originated the lorgnette. Roger Bacon, "father of science," was the first to describe convex lenses, but to his religious contemporaries it was but the jargon of

"black magic." A Florentine named d'Armati, who died in 1317, is believed to have invented spectacles. Several years later Galileo laid down common rules for finding the focal length of single lenses; Sir Isaac Newton discovered the refraction of light through prisms; Benjamin Franklin invented the first crude bifocal spectacles.

And destiny singled out another American in whom to embody great foresight and in whom to muster the energy required to assemble all existing knowledge of optics and apply it to lens-making, to organize the accumulated mass of fact and theory, and to combine it with the modern idea of quantity production. His name was George W. Wells.

Wells perceived that quantity production was imperative if the benefits of optical science were ever to be extensively conferred upon mankind. He also realized that the principles of quantity production must be employed in a way that would not diminish but would heighten precision and exactitude of manufacture. A man was required who was aware of the primitive state of optical science, and who would do his utmost to advance it. And just as critical hours in history have always produced the man to meet the needs, so this period of optical history produced its man of the hour, George W. Wells. What he did was to harmonize optical science with quantity production when the application of quantity production might easily have caused a dangerous discord.

In 1864, having been rejected on account of physical unfitness for service in the Civil War, he went to Southbridge and became one of the eleven employees in an optical shop, where, to the amazement of his companions, he was the first boy to take up the spectacle-maker's art without having served the usual apprenticeship of three years. One year sufficed, and thenceforth he devoted himself with resourcefulness and vigor to designing spectacle-making tools, dies, and machinery. In 1869 he and his brother determined to enter the optical business for themselves. Wells became secretary of the new enterprise, which was called the American Optical Company.

And now strange and surprising things began to happen. Heretofore a spectacle-maker had ground his own lenses and made the entire frame. It

Six out of ten of all eyes that wear glasses are indebted for better sight to the researches of these laboratories

was a slow and laborious manual process. The first optical machine tools had been invented in France, and had been made practical in England, but it remained for America, under the impetus generated by George W. Wells, to make them effective to benefit the masses.

The Wells idea meant specialization. And by degrees each worker was given the one special task that he could perform the best. Thus the industry acquired speed and marvelous accuracy. Handwork gave way to accurate and standardized machine work. There were no machines in existence to do much of the work, and so Wells had to invent and design a multitude of tools and machines; and modern spectacle-making began to acquire an accomplished momentum that astounded its British founders.

Until the time of his death ten years ago George W. Wells mingled almost daily with his craftsmen in the shops, inspecting the machines, alert to improve every process. For a long time he took an annual swing over the country, visiting optical specialists and looking after the correct use of his products. His physical might enabled him to work almost incessantly. He left nothing to chance. When he set his three sons to work in the shops, he told them that they could expect no favors, but that they would have to make their way solely by their own merits. To-day those three sons—Channing M. Wells, Albert B. Wells, and J. Cheney Wells—are directing the business and carrying out the ideals of the founder.

But the American genius for quantity production does not alone account for

Founded here in 1833, it was the first firm to manufacture spectacles in this country

An Institutional Story Advertisement

the pre-eminent world position of the American Optical Company. That can only be explained by the genius of George W. Wells for combining with the principles of unerring quantity production the most searching and scholarly of scientific research.

ROYAL SOCIETY INSPIRES WELLS TO ASSEMBLE DISTINGUISHED SCIENTISTS

He had long admired the courageous and brilliant pursuits of the Royal Society of London, and was a fascinated student of this, the oldest scientific society in Europe, which since its founding in 1660 had led the world in improving natural knowledge. In its quest for lenses for the relief of cataract the Society had turned to Sir William Crookes, who, at the age of eighty-one, responded with the remarkable glass that bears his name.

Inspired by the Society's achievements, George W. Wells, having become the world's greatest manufacturer of glasses, adopted a policy thirty years ago that has brought into being a distinguished research group known as the Wellsworth Scientific Staff, whose members have been permitted to spend profits without stint to gain knowledge and apply it to the correction and relief of eyes.

England, which once led the world in this branch of optics, yielded with appropriate deference to the wizards of Wellsworth. England has produced many optical scientists since Sir Thomas Young, discoverer of astigmatism and the first to prove that light is a wave vibration, over one hundred years ago. Last October Dr. Charles Sheard, head of the Ocular Division of the Wellsworth Scientific Staff, appeared before the Imperial College and delivered the Sir Thomas Young Memorial Lecture—the fourth lecture in fifteen years. He was the first American interested in physiological optics to receive this highest of honors that the British Optical Society can bestow.

Sheard joined the Wellsworth Scientific Staff after he had made his course in optics at Ohio State University famous. Volume after volume of distinguished treatises have come from his pen. He has devoted himself vigorously and resourcefully to helping vision specialists to amplify their technique. The "Journal of Physiological Optics," published quarterly by the American Optical Company, embodies the illuminating record of his studies and is eagerly consulted by hundreds of oculists.

George W. Wells—the directing brain that founded and guided this evolution of the science and art of fitting defective eyes with proper lenses and their frames

Sheard is most famous for his dynamic ocular tests, and for laying down methods to discover whether a pair of eyes work together in comfort, and whether they can economically and efficiently carry on the function of seeing. He is the author of the only book originally written in the English language on physiological optics. He has written another book on ocular accommodation. He has gone deeply into the nervous innervations which cause the eyes of many children to be as old at the age of four or five as eyes at the age of forty-five or fifty.

The placard of letters used by the optical profession to test eyes was developed in 1862 at the University of Utrecht, and has been accepted ever since, but Sheard has disclosed some serious defects, and has developed up-to-date improvements. At the moment he is also developing important new trial frames used in ocular examinations in co-operation with other members of the Wellsworth Scientific Staff.

Seven years ago the only part of most lenses that was fairly right was a spot near the center. Science had striven for years to perfect the center and improve the outer areas—a baffling job in higher mathematics. It remained for Edgar Tillyer, of the Wellsworth Scientific Staff, to attain the goal. It took him three years to complete the calculations of better lens curves in all possible combinations, and now millions of the new lenses are being produced with "effective power" to take the place of inferior old-style lenses.

Tillyer designed better periscopes for submarines and developed the gun-sights for the French 37's. He is the man who made the bombing calculations for airplanes. At the United States Naval Observatory he computed the curves for new telescope lenses; it took him six hundred days to reduce one lens alone to its correct formula.

His contributions to the invention of the lensometer, just completed, provides optical specialists with an instrument of surpassing value. It is the world's first perfect lens-measuring instrument. It detects and discloses the minutest deviations from the perfect lens power prescribed.

RESEARCH BRINGS EYE COMFORT

At heavy expense the Wellsworth Scientific Staff developed a set of master lenses for testing eyes which has been certified to by the United States Bureau of Standards. Not only have these scientists created this standard of trial lenses, but they can duplicate that set to its own accuracy, an accuracy demonstrable down to five one hundred thousandths ($5/100,000$) of a millimeter—and a millimeter is one twenty-fifth of an inch. There are 28,000,000 people living to-day who have had their eyes tested by Wellsworth trial lenses.

The absorptive glass developed by this staff of scientists is unique. It is the most efficient ever produced, and is an improvement over the famous absorptive glass invented by Sir William Crookes, which absorbs the ultra-violet rays and has proved so beneficial in bringing comfort to uncomfortable eyes. The American Optical Company has its own instruments for the precise measurement of absorptive power of lenses, and these respective Wellsworth lenses are kept at identical absorptive points in order to provide a reliable basis of comparison of their benefits to the eye. There are elements

Lensdale, in the center of beautiful Wellsworth Park, where lenses are produced at the rate of a million pairs a month

of radiant energy that are "poisonous" to certain eyes, and the shielding effects of the right absorptive lenses have fascinated Wellsworth research men. They have likewise developed a tremendously hard and tempered glass for the protection of workers' eyes against flying chips of metal.

The researches, inventions, and results achieved by the American Optical Company cannot begin to be recorded in terms of only the individual efforts of Wells, Sheard, and Tillyer. To these names must be added Wrighton, Styll, Parsons, Clancy, Schumacher, Hill, and Maynard—all outstanding experts in their various fields.

Continuous pains are taken by the management to make each worker in the plants think of himself as a potential inventor; and inventions of valuable merit have often originated at the workers' benches.

NO LONGER DEPENDS ON FOREIGN SUPPLIES

Up until five years ago the raw glass used for Wellsworth lenses was all supplied by a great firm of ophthalmic-glass makers in England. Only this famous glass plant could be depended upon to provide the quality of raw material needed. The outbreak of the World War naturally cut off the supply, and the Wellsworth staff promptly decided that no such stoppage of supplies, if preventable, should ever occur again. They began a long programme of experimental work with the glassmakers in this country, which resulted in the production of a highly perfected optical glass.

Lensdale is the name of the plant in which Wellsworth lenses are produced; and here is carried a supply of 1,500,000 pounds of raw glass at a time. It is molded in 1,600 degrees of oven heat, whence it is conducted through a succession of processes, many of which are unique.

Having inaugurated the quantity production of lenses, the American Optical Company has had to invent practically all the modern grinding methods it em-

ploy, together with the machines. Rows of the molded glass are affixed to the inside of shallow steel bowls and to the outside of similar bowls. Some bowls are tube shaped. They vary in size and form from that of an Edam cheese to almost that of an umbrella top, depending upon the various degrees of curvature required for the lenses. Each bowl revolves and sways in another bowl with an eccentric, double motion. On long rows of grinding machines filling a vast room they present a weird sight as the gigantic mechanical hands rub the lenses between their palms. Where emery is used as a grinding agent, it is the finest that Turkey produces, and even the process of washing and grading the emery had to be invented at Lensdale.

There are 70,000 window-panes in the luminous building where the finished lenses undergo their final inspections at the rate of 1,000,000 pairs every month.

Practically all the modern grinding methods used at Lensdale had to be invented there. The bowls vary in size and form from that of an Edam cheese to almost that of an umbrella top

Last October Dr. Charles Sheard, of the Wellsworth Scientific Staff, appeared before the Imperial College of London and delivered the Sir Thomas Young Memorial Lecture. He was the first American to receive this highest of honors that the British Optical Society can bestow

in this department there are contrivances that protect it against even minute particles of dust that might interfere with a perfect product.

Practically all of the optical machinery used in England and the continent has been invented and made by the American Optical Company, which manufactures a complete line of lens-cutting, drilling, surfacing, and edging machines, some of them automatic.

These machines are noted for great speed, accuracy, and ingenuity. A new lens-cutting machine is now being developed that will cut a lens in any odd shape required.

STEEL GIVES WAY TO GOLD

George W. Wells held that the best lenses in the world were comparatively useless unless they were properly adjusted to the bridge of the nose, and a trip through the great frame-making departments is a revelation of painstaking methods and extraordinary equipment. Frames are made for every conceivable facial structure; 137 different styles of temples are made, of which the most popular is the comfort cable temple made of wire twisted around a thin core wire.

The present tendency toward zylonite, or "tortoise shell," frames required the invention of new Wellsworth machinery to handle the new material. The difficulty with zylonite was to secure correct adjustment to the wearer, and this has been overcome by the Wellsworth plant by designing forty different bridge dimensions.

The company's continuous research in metallurgy and alloys long ago made steel spectacles a thing of the past; "white metal," a new alloy, took their place; and then gold and gold-filled frames were popularized by the company's labors. Green gold and white gold have been added to the extensive line. The company has ushered the spectacle-wearing world from the age of steel to the age of gold, and its inven-

Edgar Tillyer, of the Wellsworth Scientific Staff, inventor of the lensometer, which detects and discloses the minutest deviations from the perfect lens power prescribed

Wellsworth scientists studying and testing a new type of lens

tories show a half million dollars' worth or more of gold in its vaults at one time, received from the United States Mint in the form of bars and \$20 gold pieces.

A multitude of astonishing machines and intriguing processes contribute their transformations to the materials employed before the countless little assortments of parts reach the workmen who assemble them. A few random impressions will convey an idea of the novelty and ingenuity of machines and methods.

The company's gold-filled frames, for example, are the result of a highly developed and remarkable process. Between the bar of gold alloy and its core is placed a third metal, all of the same ductility, so that they cannot pull apart and so that when drawn down to even the thinness of a pin the three metals maintain the same relative thicknesses. Thus the original bar, a foot in length and a trifle more than an inch in diameter, is sometimes drawn into as much as five and one-half miles of wire destined for spectacle frames.

Through the roaring batteries of bridge-reducing machines, lubricated by their continuous geysers of sperm oil, sweeps the precious yellow metal. It emerges from the automatic temple reducing machines a marvel of flexibility. The diminutive hammers of the automatic peening machines are the utter opposites of the deafening automatics used on steel girders; these minute hammers operate with only the faintest whisper of a sound; and one Wellsworth inventor has devoted himself for twenty-six years entirely to the development and improvement of these and other amazing little hammers. There are uncanny little automatic saws that nip through metal with an accuracy adjusted to a thousandth of an inch. Soldering is accomplished by sparks from little electric "pencils." One of the polishing processes is applied by min-

gling the delicate parts with little steel balls in a soapy solution in revolving tubs. The minute screws that go into Wellsworth frames come through at the rate of a million a week, and automatic screw-drivers drive them into their places.

A gambler out West once wrote to Southbridge wanting to place an order for a pair of glasses containing lenses powerful enough to enable him to see through the back of a playing-card. He was willing to pay any price. That is a sample of the inquiries that roll in continuously to the special order department. A man in New Orleans had a false nose and wanted to wear eyeglasses; and Wellsworth ingenuity promptly designed and made him a pair equipped with a little spike that entered the bridge of the nose. This department has designed special spectacle frames for horses that are to become high-steppers by having prismatic lenses placed before their eyes.

The pure refinements of mountings and frames that have been embodied in Wellsworth products have added vastly to the comfort, stability, and correct alignment of glasses, thus enabling the prescribed lenses to do their maximum work for the human eye.

The company's expert metallurgists are sponsors for the metal; the physicists guarantee correct lens curvature and correct transmission of light rays; the chemists guard every process that touches every class of material in the world. But the chief metallurgists, physicists, and chemists are thinking of what will be done next, not about what has been accomplished.

THE FINAL CUSTOM-MADE PRODUCT

The quick replacement of a pair of broken glasses always seems remarkable. Likewise how can these specialists in any town so quickly accomplish the tasks of final grinding, polishing,

trimming, assembling, and mounting all the parts of a pair of spectacles or eyeglasses so they come forth a beautiful custom-made article, fitting the owner without a change?

The answer lies largely in the historic programme of the American Optical Company, namely, to shoulder the whole responsibility of spectacle-making without dependence upon outsiders. It has ever been painstakingly mindful of the fact that the lens manufacturer must realize that ophthalmic lenses cannot fulfill their function unless they are accurately and becomingly held in place before the eyes. So it has elected to devote itself to the making of each item of eyeglasses under its own roofs, and to co-ordinate them all under the careful direction of its own experts.

Eyesight specialists everywhere are thereby able to secure all of their equipment, including optical machines, from one authoritative source, which contributes greatly to the speed and precision of their work.

In the quantity production of ophthalmic lenses only one side of special lenses is ground, leaving the final grinding to local eyesight specialists after the correct individual formula has been arrived at. In like manner, the fitting of the frame to the individual's features crowns the whole process of the manufacture of frames and mountings. For the right pair of glasses must be the custom-made product of the local eyesight specialist.

The enormous value to humankind of the optical lenses, frames, and mountings that bear the Wellsworth stamp of exactitude is translated into its final terms of service to the individual by the local profession. And the company's manufacturing efforts and research are constantly focused upon providing eyesight specialists in every locality with the most highly perfected equipment that it is possible for science to produce.

LATEST TYPE, GASOLINE-PROPELLED, SEMI-STEEL RAIL COACH

GASOLINE CARS ON RAILS

WE have heard recently of Henry Ford's "trackless trolley." Now we have the reverse development in transportation—the gasoline car on rails. A few years ago the idea of operating a motor truck on rails would have been laughed at, yet now we have gas-propelled cars in city railway service to replace electric trolley cars.

The illustration below shows two gasoline cars in actual operation on the streets of Manhattan, Kansas.

The excessive cost of operating the heavy electric cars for a patronage which has decreased considerably since the war was the deciding reason which influenced officials of the Manhattan City and Interurban Railway Company into buying lighter equipment. It cost them between forty and fifty cents per mile to operate electric cars, and they give the public just as good service now at a cost of about fifteen cents per mile. But they gained more than simply a reduction in operating costs by installing motor equipment. They reduced their number of employees, one man operating a car instead of two; they eliminated the expense involved in the operation of a power plant and three substations; they are able to operate their motor equipment with less noise and less annoyance to the public; they re-

duced their cost of maintaining their right of way, the new equipment being much lighter and less destructive to the rails than the heavy electric cars; they reduced the liability of damage suits resulting from accidents, which were quite frequent when the electric cars jumped the tracks. Besides all of these advantages this company has done its bit toward beautifying Manhattan through the removal of overhead trolley wires and poles from the city streets.

When the first snow of the winter arrived at Manhattan, citizens were doubtful as to the ability of the cars to operate without the use of a snow-plow, as had been the custom with the electric cars. But all doubt was cleared away when the trucks, with little difficulty, plowed through the deep snow, which was drifted in places to a depth of two feet.

Another development along this line has been in the use of gasoline cars for short hauls by the railways. A number of short-line railways have been operating gasoline rail cars successfully for several years, and this is now securing wide attention on the part of officials of many of the large transportation systems.

A gasoline rail coach was recently run over the Pennsylvania Railroad from

CARS IN RESIDENCE DISTRICT

Why the Judge Named a Trust Company

"I NAMED a trust company in my will, as executor and trustee of my estate," writes Judge W., "for reasons which appealed to me so strongly that I do not hesitate to give them:

"First: I wanted the appointment of my executor to be a permanent one, not to be upset by the death of any friend that I might choose to act in that capacity, either before or after my demise—the former necessitating revising my will, the latter resulting in the appointment by the court of an administrator of my affairs of whom I could know nothing.

"Second: I desired the security offered by the resources and experience of a trust company.

"Third: I wanted the settling of my affairs on a strictly business basis, and under the management of men whose business it is to do such work and whose sole object is to comply with the provisions of my will, swayed by neither affection, prejudice nor personal gain or hope of it.

"I named a trust company as executor and trustee of my will, because I wanted the sense of security that comes with knowing that the provisions of one's will surely will be faithfully and efficiently carried out."

Your Summer Trip and Your Investments

YOUR enjoyment may be greater and your financial interests will be better served while you are away this summer, if your investments have been carefully reviewed before you leave town.

Some other matters to consider now are: the exchange of callable bonds for non-callable bonds; the investment of dividends and interest paid during your absence; arranging for prompt service in investment transactions, and for the sending of current investment information while you are away.

In all these matters our organization can assist you. We invite you to consult our nearest Office.

GASOLINE CARS ON RAILS

(Continued)

Philadelphia to Washington, a distance of 136 miles. This car maintained a speed of 33 miles an hour on the run. It has a seating capacity of 41 persons and a baggage compartment.

This experimental trip of the gas coach much impressed the railway men who were given the opportunity of testing its operation.

Railways are watching with keen interest developments in the gasoline rail

car, recognizing that equipment of this type offers an opportunity of better serving the traveling public and at a cost far below that involved in steam train operation.

Railway men are pretty well agreed that the expensive part of the railway business is the running of thousands of miles of unprofitable passenger service on small branches of main lines where traffic is light but where the people demand service. Once established, it is a difficult thing for the railways to curtail

COME TO MINNESOTA

"The Land of the Sky Blue Waters"

WHERE you can enjoy the invigorating climate—where the breeze is fraught with health and new vigor for you and the kiddies.

There are fighting muskies, gamey bass, pike, crappies and other varieties of fresh water fish. Camp, fish, canoe, swim, hike or motor amongst the delightful scenery of Minnesota's ten thousand lakes.

Reduced summer tourist fares to Minnesota lakes—ask your ticket agent about them.

Write today for free literature and information.

such service, even though it be unprofitable.

With recent improvements in the gasoline rail car before them, railway executives are alive to the situation and are now genuinely interested in the possibilities of the rail car as a solution to the problem of being forced to operate passenger trains where business does not justify doing so. They are convinced that the rail car, because of its light weight and low first cost, coupled with simplicity in operation and maintenance, is worthy of serious consideration.

CAR ON CITY STREETS

KILLING OFF THE KILLERS

BY PAUL A. WESTERBERG

UNCLE SAM is killing off the killers—which is to say that the Federal Government is obliged to wage persistent and aggressive war against the predatory animals in defense of the wild animal life of National Park and National Forest and of the herds of the cattlemen and sheepmen. More than 150,000 wolves, coyotes, bobcats, lynx, mountain lions, and "killer" bears have been killed in the six years since this warfare began.

Yet the beasts of prey persist, in spite of the fact that the hand of every man is against them night and day, year in and year out. The coyote is even widening its range. Nobody knows just why the coyote howls at night. As good a guess as any is that it is his way of notifying civilized man that he is still on the job and intends to stay, in spite of the rifle, trap, and poison. Every one who has heard the coyote give voice at night knows that a large part of the weird performance strikingly resembles mocking laughter.

Government hunters in the last six years have killed with trap and gun 156,150 wild animals that roamed the Western ranges and preyed on live stock. The campaign against these animals was begun by the Government in 1915, and now all the States except Arkansas, Oklahoma, and South Dakota are co-operating.

The list includes 406 bears, 17,842 bobcats and lynx, 133,604 coyotes, 668 mountain lions, and 3,630 wolves. The total shows the number of scalps taken; it does not include the large number of animals killed by poison. The figures would be greatly increased if those animals, too, were in the list. Many poisoned animals are never found.

THEIR DESTRUCTIVENESS

In the fiscal year of 1921 the total number of predatory animals killed was 27,637, classified as follows: 128 mountain lions, 549 wolves, 89 bears, 2,468 bobcats and lynx, 24,258 coyotes.

The average destruction of these animals is estimated to have been for each wolf and mountain lion about \$1,000 worth of live stock; each coyote and bobcat, \$50 worth; and each stock-killing bear, \$500 worth. In view of these estimates, an idea is obtained of the tremendous figure averted by the Government's skilled hunters. These figures are averages; in some cases, notably the Custer wolf (Custer, South Dakota), the depredations of individual predatory animals have reached much higher figures. The Custer wolf is estimated to have killed at least \$25,000 worth of cattle before it was disposed of not long ago.

The figures given represent the Government's activities along this line in Arizona, Arkansas, California, Colorado, Idaho, Montana, Nevada, New Mexico, North Dakota, Oklahoma, Oregon, South Dakota, Texas, Utah, Washington, and Wyoming. During the six years' campaign more predatory animals were killed in Nevada than in any other State,

largely because that State was the first to conduct a co-operative campaign with the Government, starting in 1916. The total killed in Nevada, not including animals poisoned, is put at 32,068. Utah comes second, with 21,712; Texas third, with 18,602; Idaho fourth, with 16,018; Oregon fifth, with 12,524; and Washington sixth, with 10,015.

Texas leads the sixteen States in number of wolves disposed of, the total being 1,566 during the six years' campaign, or more than forty per cent of the total number of wolves killed in all sixteen States. Wyoming ranks second in number of wolves killed, with 480; New Mexico third, with 441; Montana fourth,

with 339; Arizona fifth, with 183; and Utah sixth, with 170.

In the number of coyotes whose scalps have been taken by the Government hunters and in co-operative campaigns, Nevada leads, with 27,173; Utah second, with 18,767; Texas third, with 14,830; Idaho fourth, with 14,454; Oregon fifth, with 10,351; and Washington sixth, with 9,631.

Arizona and New Mexico account for nearly two-thirds of the total number of mountain lions killed, their totals being 255 and 170, respectively. In Utah 71 mountain lions were killed; in Oregon, 43; in Colorado, 36; in California, 29; and in Nevada, 24.

THE OUTLOOK CLASSIFIED ADVERTISING SECTION

Advertising Rates: Hotels and Resorts, Apartments, Tours and Travel, Real Estate, Live Stock and Poultry, sixty cents per agate line, four columns to the page. Not less than four lines accepted.

"Want" advertisements, under the various headings, "Board and Rooms," "Help Wanted," etc., ten cents for each word or initial, including the address, for each insertion. PORTRAIT OF A TENDERFOOT

SPLASH! A beaver dived from the top of his house in the middle of the large pond in the heart of the forest; a lynx, one of the lesser variety, shrank into the shadow of the pine tree in which he was hiding and stiffened himself against the bark; the whisky-jacks, the plague of the Northern lumber camps, stopped their incessant chatter and skulked into the hemlocks; the porcupine stopped his gnawing and moved higher up the tree; and all the forest creatures that five minutes before had been busy in the quest of food seemed to stop and seek a hiding-place.

For full ten minutes not a sound disturbed the silence, then a heavy tramp became audible far down an old deer trail. A man of short, stock appearance passed underneath the tree wherein the lynx cat crouched. He was clad in a new khaki hunting coat with large pockets, and over his shoulder swung a Winchester rifle of a large caliber—in fact, entirely too large for the woods he was hunting in, for, although this was in southern New Brunswick, the large game, such as wolves, panthers, bears, etc., had been cleaned out by sportsmen, lumbermen, and trappers. The only signs of game he saw were when a cock partridge would rise on whirring wings and catapult out of sight over the tops of the hemlocks or a red squirrel would flash around a tree and quirk his tail at him.

Once he saw something through the branches and fired at it, but it turned out to be a Canada jay, much to his disgust, and he had shot off some of its tail feathers.

Finally he saw a rabbit, and, taking careful (?) aim, fired. He succeeded in making the rabbit navigate under full head of steam toward some unknown region and in disturbing the landscape generally, but it was plain that the result was not very satisfactory to him. He reloaded the gun with somewhat impolite language; and meanwhile a rabbit was watching him from the shadow of a near-by tree, a pair of red squirrels chattered above his head, a lynx cat glared at him from a hemlock fifty feet away, and a beaver slept snugly in his house in the near-by pond. However, the unseeing eyes of the tenderfoot saw nothing but the somber pines, the rotten logs, and a dull sheet of water in the distance.

His footsteps had hardly died away when the forest once more awoke; the lynx came out of his hemlock into the fading twilight and returned to his hunting, a fox came trotting along leisurely and sniffed at the tracks in the deer trail and then started to trail a rabbit, the mice began to scamper about in the leaves, a mink came hunting rabbits along the edge of the stream, a rabbit went hopping along, nibbling here and there, a great-horned owl screamed his warning to all the smaller forest folk, and there was a resounding crash as a beaver cut a six-inch poplar near the bank.

CHARLES B. BARR.

Litchfield, Connecticut.

How was she to know?

FINALLY he appeared one evening—the man who stirred her heart—the man, at last, who captured her instant interest.

All the rest had seemed only casual, arousing never a single, serious emotion.

But he seemed so different! The moment their eyes met there seemed to be an understanding. They felt drawn to one another.

Through a mutual friend an introduction was arranged. Then they danced.

But only one dance!

He thanked his partner and went his way. She saw no more of him. Why he lost interest was a mystery to her.

How was she to know?

* * *

That so often is the insidious thing about halitosis (the scientific term for unpleasant breath). Rarely indeed can you detect halitosis yourself. And your most intimate friends will not speak of your trouble to you. The subject is too delicate.

Maybe halitosis is chronic with you, due to some deep-seated organic disorder. Then a doctor or dentist should be consulted. Usually, though, halitosis is only local and temporary. Then it yields quickly to the wonderfully effective antiseptic and deodorizing properties of Listerine.

Fastidious people prefer to be on the safe and polite side. They make Listerine a systematic part of their daily toilet routine—as a gargle and mouth wash.

It is so much easier to be comfortably assured your breath is sweet, fresh and clean; to know you are not offending your friends or those about you.

Start using Listerine today. Be in doubt no longer about your breath—Lambert Pharmacal Co., St. Louis, Mo.

Steel ingot being taken from reheating furnace preparatory to rolling into rails

Rails and Research

THE New York Central Lines have placed orders for 172,400 tons of heavy open-hearth rails for 1922 delivery, enough to lay a new single track from Chicago to New York. In 1921 more than a thousand miles of rails were replaced.

In the New York Central research laboratories, out of the experience of never-ending road tests, has been developed the highest type of rail used in this country.

This search for absolute dependability in rails, to carry the weight of more and more powerful locomotives and heavier trains, insures the safety and comfort of the millions of passengers who ride each year on the New York Central Lines.

The rail ingots are made on precise physical and chemical specifications. From the time the ore enters the furnaces until the rails emerge from the great rollers, every step in the process is in conformity to the most rigid scientific requirements and under the eyes of New York Central rail experts.

When fabricated, the rails are subjected at the steel mills to exacting tests in machines of scientific precision. These tests are for the purpose of making certain that the finished rails are as nearly flawless as it is humanly possible to make them, and will withstand the strains of the heaviest traffic.

The 1922 rail order is an important part of the program undertaken by these Lines that they may efficiently perform a maximum share of the work of national transportation.

BY THE WAY

BIG department stores try to be absolutely truthful in their advertising. An instance is pointed out in a new book called "The Romance of a Great Store." An advertisement featured coats for small boys at \$8.74. These were advertised as "wool chinchilla," and so potent was the appeal that by ten o'clock on the morning when the advertisement appeared the entire stock of nine hundred coats was sold. Then one of the store executives discovered that the coats were not all wool and things began to hum. The big boss said "wool" means "all wool" except where it is clearly specified that the garment contains cotton. Another advertisement was inserted the following day in the newspapers. It apologized for the misstatement and said, "We would deem it a favor if our customers would bring in these coats and accept a return of their money." But out of the nine hundred coats only two were returned, for the customers realized that they were getting good value for the price charged.

Belgian industries, hard hit by the war, are slowly coming back. An example is that of the "Wagons-Lits," a company which controlled almost entirely the international sleeping car business in Europe before the war. Many of its cars, which were replete with devices for the comfort and safety of passengers, were confiscated by the Germans when the war began. These ill-gotten gains have lately been restored, according to the "Railway Gazette" of London, and the company's business is approaching its pre-war proportions.

The trouble with communism as a social system has rarely been more tersely set forth than in the following extract from an article on Russia in the "Chase Economic Bulletin:"

The great advantage of a system of private enterprise, where a large number of competing firms conduct the business of the country, over a unified communistic system is that less ability is required to make it work right. A communistic system, undertaking to control the industries of a country, must be guided by a central brain of such extraordinary grasp and power that it can visualize the industrial situation as a whole, and can work out the co-ordinations required to keep things in proper proportions. Under a capitalistic system, industry is kept in proper proportions by the automatic regulations which market prices supply.

"A subscriber wants to know what we think of the proposed deal between Uncle Sam and Henry Ford," the "National Stockman and Farmer" observes. "We are certain of only two things about it. One of them is that the place should be spelled Mussel Shoals. That is the way it was spelled during the Civil War, when some of the hungry boys of both armies tried to eat the mussels after much and various cook-

ing. The only trouble with this comment is that the word "mussel," denoting a bivalve mollusk, is also spelled "muscle" by the dictionaries. The man who tries to get a bet on "mussel" as the only spelling is in nearly the same case as the joker who asked, "How do you spell the word that describes singers in a church—it's q-u-i-r-e, isn't it?" The "certain" man says, "No, it's c-h-o-i-r, of course," and loses his bet on a sure thing when the dictionaries are consulted and quire is found to be a legitimate variant.

An English missionary preacher, the late Archibald Brown, told this story on himself, according to the London "Chronicle." A representative of the East London Mission visited a sick man who had been influenced by Brown. "Ah," said the man, "before Archibald Brown came I feared neither God nor the devil. But now, under his blessed teaching, I've learned to love 'em both."

One of the great burdens on our National transportation system, the "Railway Age" says, is involved in the necessary renewal of city terminals, for roads whose mileage has not measurably increased. It cites work of this character in Chicago alone which involves many millions—that of the North Western, now completed, costing \$20,000,000; what is known as the Union Station group, to cost over \$65,000,000; that of the Illinois Central, to cost \$85,000,000; and plans for other stations involving an expenditure of \$50,000,000. Besides this, the railways of Chicago are carrying out a vast scheme of track elevation to cost \$150,000,000. Against these immense sums must be set, however, the intangible assets of beauty, convenience, and safety which are associated with these stupendous improvements, as well as their tangible value in handling increased traffic.

A teacher asked, as reported by a London comic paper, "What would King Alfred, if he were alive now, think of the Home Rule Bill?" and the boy answered, "If King Alfred were alive now he would be too old to be interested in politics."

The numbers seven and nine seem to have been regarded as lucky or sacred in the older days, judging from the numerous entries under these numbers in a recently published reference book. There are the seven ages of man, the seven arts, the seven bibles of the seven religions, the seven bodies in alchemy, the seven champions of Christendom, the seven churches of Asia, the seven deadly sins, the seven sages of Greece, the seven seas, the seven senses, the seven virtues, the seven wonders of the world, etc. Then there are the nine gods, the nine Muses, the nine orders of angels, the nine spheres, the nine worthies, and a "nine days' wonder." The last-named phrase receives this curious explanation: "Said to be derived from the interest and excitement of children over the nine days' blindness of a newly born kitten."

ASIA

If you are going to Hawaii, to China, to Japan, send the information blank below. If you long to explore the mysteries of the Far East—if you dream of glorious days of relaxation on shaded decks as you glide over the smooth waters of the South Pacific write today. Let your Government tell you about the palatial new American ships that ply between San Francisco and the Orient. Let your Government smooth your way with travel helps.

A new booklet has been prepared for you containing official information every traveler should have. It will be sent without charge. Just send your name on the information blank below.

Palatial new U. S. Government ships operated by the Pacific Mail Steamship Company now sail from San Francisco to the Orient via Hawaii—the Pacific Mail's famous "Sunshine Belt to the Orient." A day's stop is made at Honolulu. Additional stopovers may be arranged in any Eastern Country.

These ships are American-built, oil-burning vessels of 21,167 displacement tons and 535 feet in length. They were designed for war service and to combat submarines but have been rebuilt into modern and luxurious liners. Their speed and safety (seven water tight compartments protect the prow alone) make them unique among the merchant ships of the world.

Sister ships they are alike in every luxurious detail. The spacious staterooms are all outside, equipped with beds (not berths) running hot and cold water, electric fans, electric radiators, bed reading lamps, telephones. Most have private baths. The social Rooms are exquisitely beautiful—decorated in the soft greys so delightful to Americans.

Write for Booklet

Your Government wishes the name of every prospective traveler. If you are considering an ocean voyage, send the information blank now—no matter when you intend to go. You will receive the Government's booklet of authentic travel information about passports, income tax requirements, etc., description of U. S. Government ships and literature telling the places to go and things to see in foreign lands. No obligation is implied.

If you yourself cannot take an ocean trip, clip the information blank anyway and urge some friend who may go to send it in.

THE MAIL BAG

"CLEAR THE WAY"

A LITTLE inquiry in "By the Way" in The Outlook of May 31 awakens old memories. A subscriber asks who wrote "Men of Thought and Men of Action, Clear the Way." My mother used to recite this sixty years ago at Civil War rallies back in Michigan. Charles Mackay wrote it in 1845 for the London "Daily News," when Charles Dickens was the editor of it. Mackay, himself editor of the Glasgow "Argus," was the poet of the stirring, forward-looking days around 1848. He wrote hundreds of battle paeans of progress. Henry Russell and Sir Henry Bishop set them to music. They were sung all over the world. My father and mother, with many other immigrants coming from Scotland, recited and sang these pieces at anti-slavery meetings, war gatherings, prohibition rallies, and woman's rights assemblies in the old days. The favorite Mackay songs were "Cheer, Boys, Cheer," "The Cry of the People," "The Watcher on the Tower," "The Good Time Coming," "To the West, to the West," "A Dream of Coming Years," "Said I to Myself, Said I."

The line your correspondent quotes is from Mackay's song, "Clear the Way," published, like most of his compositions, in a newspaper first, and then in a book, "Voices from the Crowd," a collection of the verses printed between 1845 and 1846. In 1876 Frederick Warne & Co., London, printed "The Poetical Works of Charles Mackay," containing two hundred of his most popular songs.

"Clear the Way" has three stanzas.

In these troubled times The Outlook might do worse than reprint the whole of it:

CLEAR THE WAY

Men of thought! be up, and stirring
Night and day;
Sow the seed, withdraw the curtain,
Clear the way.

Men of action, aid and cheer them
As ye may!

There's a fount about to stream,
There's a light about to beam,
There's a warmth about to glow,
There's a flower about to blow;
There's a midnight blackness chang-
ing

Into gray;

Men of thought and men of action,
Clear the way.

Once the welcome light has broken,
Who shall say

What the unimagined glories

Of the day?

What the evil that shall perish
In its ray?

Aid the dawning tongue and pen;
Aid it, hopes of honest men;

Aid it, paper; aid it, type;

Aid it, for the hour is ripe,

And our earnest must not slacken

Into play.

Men of thought and men of action,
Clear the way.

Lo! a cloud's about to vanish

From the day;

And a brazen wrong to crumble
Into clay.

Lo! the Right's about to conquer,
Clear the way.

With the Right shall many more
Enter smiling at the door;

With the giant Wrong shall fall
Many others, great and small,

That for ages long have held us
For their prey.

Men of thought and men of action,
Clear the way!

In June, 1886, Bishop Potter, of New York, delivered the baccalaureate address at the University of Michigan. His theme was the university's duty to deliver to the Nation an output of men concerned with more than athletics, dances, fraternities, and passing examinations. He pleaded for public-minded youth, trained to a desire and ability to serve the general welfare as the Fathers of the Republic expected public education would do. When he came to the close of his moving appeal and swung into Mackay's verse,

"Aid it, paper; aid it, type;

Aid it, for the time is ripe,

And our earnest must not slacken
Into play,"

the little gray woman beside me became more and more excited. She took up the words with the eminent orator, spoke them more and more distinctly with him, until the recitation was a duet, and when he finished she rose and waved her parasol and shouted, "Hurrah, hurrah!" much to the enthusiastic approval of the auditors. Old friends still remind me how my little mother helped the eminent Bishop conclude his address.

THE FARMERS AND CANADIAN RECIPROCITY

THE purpose of the protective tariff system as laid down in the Republican party's National platform is to afford the industries of the United States protection equal to the difference between the labor cost of production here and in foreign countries. It has been clearly shown that in so far as Canada is concerned this principle does not justify even the present tariff rates on goods imported from that country, since in practically all the important industries wages are as high as in the United States. The old-time high-tariff argument based on the competition of alleged "pauper labor" has therefore no application to Canadian products.

Whether it will be possible to secure the adoption of a tariff agreement similar to the Canadian Reciprocity Treaty

of 1911 will depend almost entirely upon the attitude taken by the American farmers. Their opposition to that measure was generally misunderstood, as it was popularly supposed that they were actuated by a belief in protection as a principle. In reality, their position was simply that so long as the country adhered to the protective policy they would insist that farm products should receive the same measure of protection that was accorded to manufactured articles, and their chief objection to the treaty was that it made no material reduction in the duties on Canadian manufactures that would be of benefit to them through lessening the cost of what they had to buy. Many of the farm leaders were, and are, free-traders, who believe that high protection has unduly increased prices of manufactured goods and has therefore injured, instead of helping, the farmer, but they do not want what they term a "jug-handled" tariff, with free trade for the farmer and protection for the manufacturer.

The practical failure of the Fordney Embargo Tariff Law to give relief to the farmers, coupled with their recognition of the fact that if we are to find foreign markets for our surplus farm products we must be prepared to accept payment in goods, since the foreign buyer cannot pay in gold, has shaken the faith of many farmers in the protective theory, and their influence has already been shown in opposition to some of the schedules of the Fordney permanent Tariff Bill. The action of the Senate Finance Committee in announcing its abandonment of the "American valuation plan," provided for in that measure as passed by the House, was largely due to protests made by influential farmers.

Should the Senate approve the pending Tariff Bill in substantially its present form, with its generally higher rates than those of the existing tariff, the farmers may be inclined to ask for continued protection, in the hope that it will give them higher prices for their products to compensate for the increased prices they will be forced to pay for manufactured articles. To be logical, they should repudiate the high-tariff policy, but farmers are not more logical than other people; for instance, the leaders in Congress who favor large appropriations for ship subsidies while approving the imposition of customs duties that will assuredly restrict foreign trade and make less traffic for the subsidized steamships. It will be unfortunate for both the United States and Canada if the adoption of higher protection for manufactures by Congress should result in the maintenance between the two countries of tariff walls that serve no useful purpose.

JUNE 14, 1922

THE PROGRESSIVE SPIRIT IN JAPAN

FROM fragmentary and not yet wholly verifiable despatches from Japan we learn that there are welcome signs of the growing spirit of democracy and progress there. Already the Japanese Government has ratified the Shantung Treaty with China and is putting it into execution. Those observers at the Washington Conference who believed that in the Shantung conversations Japan was proceeding in good faith, of which her caution in giving her word concerning each item in the agreement was strong evidence, have so far been vindicated by the events. The unhappy adventure of Japan in that Chinese province (for Japan's effort to out-German the Germans along the line of the Tsingtao-Tsinanfu Railway was an unhappy adventure) is apparently concluding happily. China's state of disorganization is a serious obstacle to clearing this matter up; but apparently Japan is doing all that could possibly be expected of her to end the whole Shantung question.

In the meantime there has been news of a shake-up in the Japanese Cabinet. Premier Takahashi, according to rumors which reached this country a few days ago, had resigned with several members of his Cabinet. Among those reported to have resigned were some of the more elderly and conservative peers, and there was some speculation as to the political consequences. It is now reported by the Associated Press that the leaders of the majority party have continued Premier Takahashi in office, with authority to expel members of the Cabinet that refuse to follow his policy. It is another one of those steps which Japan has been taking away from control of the Government by the military power and in the direction of party control of the Government.

When Mr. Hara became Prime Minister, he proceeded to translate into practice his idea of party control. Up to his accession the real control in Japan was in the hands of the army and navy. The fact that that control was often exercised with restraint and to the advantage of Japan does not alter the fact that the ultimate power in Japan was practically militaristic. It was the rule, for example, that the Minister of Marine (i.e., the Navy) should be an admiral and the Minister of War should be a general. The real power, in fact, was with

Keystone
HORATIO BOTTOMLEY, FORMER PUBLISHER OF "JOHN BULL," FOUND GUILTY OF MISAPPROPRIATION OF FUNDS

the naval group. No matter what popular support the Government might have, the navy could veto any Government policy by refusing to let any admiral serve in the Cabinet. Mr. Hara, with great ingenuity, broke into this naval control by sending Admiral Baron Kato, the Minister of Marine, as head of the delegation to Washington, and took the vacated office himself. Thus for the first time the Minister of Marine was a civilian. When Mr. Hara was assassinated, Mr. Takahashi, his successor as Prime Minister, became his successor also as Minister of Marine, and held the office until Admiral Baron Kato returned. Thus was established a precedent of the utmost significance, but one which has been largely overlooked.

Now comes another piece of evidence that popular self-government is growing stronger in the Japanese Empire. The Seiyukai party, which is in control by a large majority in the Parliament of Japan, appears to recognize the fact that if it is to stay in power it must encourage responses to popular feeling. The failure of the Cabinet as formerly composed to respond to Premier Takahashi's policies had to end either in the defeat or the victory of the recalcitrant members. That it has ended in their defeat through pressure from the leaders of the majority party is an important indica-

tion of the progress of Japan toward government by the representatives of the people.

BOTTOMLEY PASSES

PICTURESQUE Englishman has gone into at least temporary eclipse. He is Horatio Bottomley, financial necromancer, orator extraordinary, journalist amazing, and hater of things American. Bottomley has had a career of the type which makes some people despair of popular government. The type has been known in all ages wherever government has existed capable of being swayed by popular appeal. Rome knew the type well, and we are not without examples on this side of the water.

Bottomley began his career as the supporter of Charles Bradlaugh, the atheist, in the House of Commons. While a member of the House of Commons he became a promoter of Australian gold-mining stock. When the gold craze bubble burst, most of Bottomley's fellow-promoters went into well-deserved oblivion. Bottomley's bankruptcy was pleasantly condoned and he himself returned to the House of Commons.

Mr. P. W. Wilson, who sat with Bottomley in Parliament, gives in the New York "Times" a striking account of his personality and his peculiar genius.

It was after Bottomley's bankruptcy

that he started his weekly "John Bull," which ran up to a circulation of two million and a half. Of this weekly Mr. Wilson writes:

What Bottomley offered was the pointed paragraph, the impudent but amusing sneer, the exposure of petty scandal, and great swelling words of discontent, denunciation, and vague aspiration. For his enemies he had a morgue, where week by week he published their epitaphs. Among the first whom he buried, if in modesty I may recall the fact, was myself; more illustrious corpses were soon discovered, for instance, Lady Astor. Any one, indeed, who loved America had to die. The neutrality of the United States was to Bottomley "a monument of infamy," and to all anti-American sentiment he pandered without scruple.

Of his power as a speaker Mr. Wilson says:

Short and thick-set, Bottomley, like Spurgeon, the preacher, is endowed with a voice of exquisite timbre. It is soft, resonant, musical, a voice equally effective in a court of law, the Albert Hall, or the House of Commons. Beyond question, Bottomley is among the greatest orators of our day. He is persuasive. He always seems to be lucid. He can explain any point that he wants to make clear. But he has also humor, sarcasm, and a command of rich eloquence, which may be and doubtless is mere acting, but reveals none the less the actor's sincerity in his art. Bottomley is neither ill-read nor inaccurate. He displays all the skeptic's knowledge of the Bible; and in the choice of words, at any rate, his taste is unerring.

Bottomley's downfall came from his personal extravagance and his expansive financial imagination. He established bond clubs in which people of limited means invested their all to the extent of some \$3,000,000. Complaints as to the difficulty of securing money owed to investors resulted in Bottomley's suing his critics for libel. One critic was acquitted, and this acquittal was the beginning of the end. Mr. Wilson says that the decline of Bottomley was speeded by the continuous comments of "Truth," the journal which still carries on the tradition of its founder, Labouchère. Bottomley was tried and found guilty of a misdemeanor. Mr. Wilson justly says:

Investing the money of soldiers and their dependents was, of course, an enterprise too mean to be tolerated unless the investments proved to be sound. In Bottomley the workers of England have had a severe lesson, and his conviction by a jury cannot fail to be salutary.

At least Bottomley has one advantage over some men of similar stripe in the United States. He was loyal in the war. Our demagogues have not hesitated at disloyalty to the Nation in their efforts to further their personal ends. They

have sought to arouse blood against blood. They have sold the birthright of the Nation for a mess of alien votes.

IRELAND'S QUARRELS

THE troubles of Ireland continue to occupy a disproportionate amount of the world's attention. Ireland's population was only 3,242,670 at her last census (1911), not much more than half the population of the State of Illinois or a third of that of the State of New York. The quarrelsome spirit, the lack of recognition of minority rights, the ancient bitterness between religious zealots, the habit, so to speak, of war by assassination, are largely responsible.

Neither the London agreement as to the Irish Free State nor the recent pact between Sinn Feiners who want the Free State and De Valera's irreconcilables who will not stop their outcry for a Republic has settled the trouble. The pact's main point was that the anti-Free State leaders should have four Cabinet Ministers in the Government to be formed after the coming election. This would be a minority of the Ministry. The agreement was a great concession by Collins and Griffith, of the Free Staters, and was defended by them in their recent conference in London with Winston Churchill on the ground that it was the only way to avoid a clash that might entail another state of guerrilla war in Southern Ireland. But Churchill pointed out that Article XVII of the London treaty requires that every member of the Free State Ministry must sign a written pledge of modified allegiance to the King—a thing which De Valera and his associates positively refuse to do. It is thought that some way may be found of adjusting this difficulty. The vitally important thing in Southern Ireland is to get an acceptance by the people at the polls of the Free State plan, which makes of Ireland a self-governing Dominion like Canada. The exact terms of the Constitution to be adopted thereafter may well be left until after that election and later submitted in a referendum election. The one thing that stops the way in Southern Ireland is the obstinacy of the minority in refusing to accept what the majority of their Sinn Fein body has approved.

Ulster is still under British law. She has the Home Rule Government, Cabinet and Prime Minister she put in power under the provisions of the Home Rule Bill. Southern Ireland elected Parliamentary representatives under that bill, just to show that the Sinn Fein could carry the elections; but they refused to organize. The men elected have practically made up the Sinn Fein's Dail Eireann. But Ulster has been unable to keep the peace within her own bor-

ders. Therefore Great Britain has done her plain duty by driving back from Ulster's borders invaders of the so-called Irish Republican army and their Ulster Sinn Fein adherents. There was a miniature battle last week about the little town of Pettigo in which several thousand British troops were used; infantry, cavalry, artillery, and whippet tanks are said to have taken part, not so much in actual fighting as in clearing the territory. The casualties were slight; only one of the British force was killed; the insurgents' loss is put variously at from seven to fifty. Hereafter the border will be held by British forces against sporadic invasions from either side, all made under the guise of retaliation for injuries inflicted. Irresponsible fighting and local rioting have brought Ulster, and especially Belfast, into a pitiable state of anarchy. Only a strong hand can put down the semi-political crimes that are committed from day to day by lawless men of both factions.

BELGIUM AND AMERICA: AN INTELLECTUAL EXCHANGE

FEW people are aware of the fact that a quite extensive system of fellowships exists between Belgium and America. The plan of an exchange of intellectual ideas between two free countries brought into such close sympathy during the war drew its origin from the fact that when the Commission for Relief in Belgium closed its five years of work unspent balances were in the hands of the Commission. Mr. Hoover and all concerned agreed that these balances really were the property of the people of Belgium. What should be done with the money? The Belgian Premier, M. Delacroix, urged that it should be so used as to be of lasting benefit to the people and at the same time should commemorate worthily the relief organizations of the war. Mr. Hoover in turn suggested that the extension of education in Belgium was exactly such a method. It was decided to apply the money to the needs of Belgian universities and technical schools and also in enabling sons and daughters of those without means to undertake such higher training. Thus grew up what is formally called the C. R. B. Educational Foundation, and out of that in turn developed the Fondation Universitaire.

A most interesting work has been the plan for exchange fellowships. First, Harvard, Yale, Princeton, California, and Stanford Universities agreed to receive each two Belgian fellows for graduate study, while the four Belgian universities in turn offered to receive an equal number of Americans. This plan has increased and broadened. We have

before us a list of the Belgian exchange fellows for the current year, which is quite surprising in the variety of subjects which these Belgian scholars propose to study in America and in the wide choice they have made of American colleges. From fifteen to twenty different American universities have been indicated as the choice of these young men.

There is also an exchange of American and Belgian professors under the same general plan that has grown up between the United States and other foreign countries. One such American exchange professor is now in Belgium—Professor Millikan, of the California Institute of Technology; he is lecturing on physics in the four Belgian universities; Professor Pirenne, former Director of the University of Ghent, is to lecture in exchange in America this fall on mediæval history.

Evidently there is practical value in this interchange of intellectual ideas and intellectual scholarship. There is also a pleasing and gratifying indication of permanent friendliness and helpfulness as between America and Belgium.

HOW MUCH OF AN ASS IS THE LAW?

FROM very early times the law has been an object of derisive comment and of criticism as an instrument of injustice. A dictionary of quotations affords any inquirer examples. Bacon's statement that "one of the Seven was wont to say: 'That laws were like cobwebs; where the small flies were caught, and the great brake through,'" is paraphrased by Swift. Goldsmith puts it in a line:

Laws grind the poor, and rich men rule the law.

Mr. Bumble is not the only one who has thought that "the law is a ass—a idiot," and has said as much; and though perhaps there be few except rogues who would go so far as Jack Cade's follower, Dick the Butcher, who when confronted with a vision of England reformed and made glorious shouted, "The first thing we do, let's kill all the lawyers," yet there are many perhaps who in their hearts are sure it would not be the last thing they would do.

Such disregard for the law's dignity and such disrespect for claims to legal infallibility may not be surprising as coming from the Bumbles or the Cades of the day; but it is somewhat surprising when criticism of the law's delays and the law's ineffectiveness is reported as coming from the mouth of one of the most conservative leaders of the bar. In the New York "Times's" report of a discussion before the Committee on Law Enforcement of the American Bar Association recently, in which Mr. Henry W. Taft, of New York, took part, it is stated that:

Mr. Taft offered statistics showing that murder was twenty times as common in this country as in the British Empire, a fact which he laid largely to maladministration of criminal justice in this country. His statistics showed 2,200 executions in this country over a period of years for 131,000 crimes, or about one conviction for every sixty-five murders, while in England and Canada there was almost an average of one execution for every two crimes. He held this to be due partly to a sentimental attitude on the part of the community toward criminals and to such rules as that which excused the defendant from taking the stand or from being assailed by the prosecutor for his failure.

"Rather than keep some of them," he continued, "I would wipe off the books every rule relating to evidence. I think we would come out better."

Such a statement as this attributed to a radical might well have aroused remonstrances from many citizens and from newspapers of both parties; for certainly the suggestion that the admission of hearsay evidence to a court of law in the trial of those accused of crime would be better than the present conditions is very little, if anything, short of revolutionary; but attributed to one of the leading lawyers of the country it apparently has aroused no stir. Whether Mr. Taft was accurately quoted or not is aside from this point. What is significant is that these words as coming from him have caused no sensation. The reason, it seems to us, is clear. Those words represent substantially an opinion that is widespread. It is very generally believed to be true that technicalities have so interfered with the administration of justice, have so obstructed legal measures for the safety of society, have so prevented the courts from acting as safeguards against the criminal, that the ancient rights of the liberty of the individual which the courts have preserved have been obscured by the practices which lawyers and judges have employed for the undeserved benefit of men really guilty.

It is not our purpose here to report the various proposals made for improving the administration of the law. Many such proposals have been made before the Committee on Law Enforcement of the American Bar Association. Some of these proposals concern rules of evidence. Some concern the attitude of judges. Some concern the methods of attorneys, including members of the District Attorney's staff. Some concern the provisions of statutes. And some of these proposals concern the unreasonable or sentimental or emotional attitude of the public. It is a long process to modify so cumbersome a machine as

the law; but it is a process which should be pushed with energy; for the greatest lawyers recognize the fact that there is much in the administration of the law which defeats the law's ends. It is time that something were done to put an end to conditions which enable a city magistrate of New York to say, even though it be recognized as an exaggeration: "As soon as a man gets to be a rascal, he runs to the Constitution. An honest man that has been robbed has no Constitutional rights."

LABOR UNIONS NOT EXEMPT FROM THE SHERMAN LAW

THE decision of the United States Supreme Court, announced last week by Chief Justice Taft, in the case of the United Mine Workers of America vs. the Coronado Coal Company is of Nation-wide importance because it affirms that labor unions, although not incorporated, may be sued for damages to property by their members, and that their funds, including strike funds, may be attached. But if such an action is brought (as was the one in question) under the Sherman Law, it is necessary to show that the wrongful acts committed have been part of a conspiracy to restrain or monopolize inter-State commerce. The finding as to the liability of unions to seizure of their funds and prosecution of their members was in this case a secondary rather than the primary issue. The Supreme Court found as to the facts that those accused of illegal acts had not violated the Sherman Law, because they had not interfered with inter-State commerce, for the Court held that the actual mining work at and near the mine is local in character, not part of the inter-State coal industry. This does not at all, however, affect the extent and seriousness of the ruling that now positively makes unincorporated labor organizations responsible legally and financially for illegal acts of their members. Chief Justice Taft declared as to this:

Congress was passing drastic legislation to remedy a threatening danger to the public welfare and did not intend that any persons or combinations of persons should escape its applications. Their thought was especially directed against business associations and combines that were unincorporated to do the things forbidden by the act, but they used language broad enough to include all associations which might violate its provisions recognized by the statutes of the United States or the States or the Territories or foreign countries as lawfully existing, and this, of course, includes labor unions, as the legislation referred to shows.

In the case in question the lower Court had held that the unions were liable for over \$600,000 for injury to mining property in an Arkansas strike.

International

THE "PROSPERITY SPECIAL" ON ITS WAY WEST

The United Mine Workers appealed to the Supreme Court, and the former decision was reversed. Thus, so far as this case goes, the labor organization wins a victory, but the ruling as to responsibility will be a hard blow to the contentions of leaders like Mr. Gompers who have opposed the incorporation of unions on the ground that they ought not to be made financially responsible. A principal part of the contention of the miners' counsel was that both the National and local unions involved were unincorporated, and therefore not subject to suit, so that the ruling on that point was, we judge, a substantial part of the decision, and not *obiter dicta*.

Apart from the legal aspects of this decision, it will be welcomed by the very large number of people who have long believed that legal and financial responsibility by unions for acts committed by their members under the sanction of the unions would tend to reasonableness and security of industrial conditions.

THE "PROSPERITY SPECIAL"

AMONG the signs of returning and increasing prosperity that shrewd observers are noting in many directions, not the least significant is the recent journey of a great train of oil-burning locomotives from the East to the West. The train pulled out from Eddystone, near Chester, Pennsylvania, on May 26, bound for East St. Louis. It consisted of twenty enormous machines, each nearly one hundred feet long and each weighing 621,000 pounds. They are destined to haul vast loads of freight on steep grades of the lines of the Southern Pacific system. Thirty more of these locomotives of the same pattern and dimensions are to follow.

The sending of this great addition to the freight-carrying capacity of a Western railway system was regarded as of much more than local interest by the President of the United States, who sent a congratulatory message to the Baldwin Locomotive Works on the under-

taking. Governor Sproul, of Pennsylvania, also recognized the occasion by a message. Mr. Samuel M. Vauclain, president of the locomotive company, in an address during the ceremonies that accompanied the departure of the train, said: "This special is to inspire the confidence of the people in their own country and in themselves; and it will demonstrate another thing—that the two great shores of this country are in harmony with each other. The Pacific comes to the Atlantic to get the best locomotives, produced at the lowest cost."

Each locomotive in this train, which was nearly half a mile long, bore on its side a large sign, "Prosperity Special." The train traveled only in the daytime, and, to promote the object suggested by its name, the locomotives were exhibited at the principal cities on its route, circulars being sent in advance calling the proposed exhibition to the attention of boards of trade, school authorities, public officials, and citizens generally. The great weight of the train (over 6,000 tons) made several detours necessary on its way to the West, in order to avoid certain narrow tunnels and to transport the train over bridges of the requisite strength.

NORTH CAROLINA SPEEDS A GOOD CAUSE—AND THE CLOCK

NORTH CAROLINA seems to have made a good start in the direction of supplying "athletics for every one," which is the aim of the National Amateur Athletic Federation—the organization which has locked horns with the Amateur Athletic Union on the issue of selecting athletes to represent America in the next Olympic Games. Apparently North Carolina is going to have its own athletic records in good shape by 1924. For it has just completed a successful State-wide tournament which enlisted the efforts of more than a thousand athletes, representing colleges, universities, high schools, Y. M. C. A.'s, military com-

panies, and industrial plants. The State-wide games were held at Durham, under the auspices of the Y. M. C. A., the Chamber of Commerce, the Rotary and Kiwanis Clubs, and the Merchants Association. Accommodations for the visiting athletes were well organized and each competitor provided with a comfortable bed and meals at less than cost.

Nine divisions of sports were on the schedule: Track and field, boxing, wrestling, golf, tennis, baseball, volley ball, swimming, trap shooting, and horseshoe pitching. Every man, before being permitted to compete, had to have his amateur standing certified by the president or the athletic head of the organization that he represented.

We are told that it is the intention of the organization which has been created as a result of these games to hold yearly Olympics hereafter. Certainly this shows how earnestly North Carolina has entered into the movement for "athletics for every one." It also shows the rapidity of life in the "Old North" State. Who knows but that in time a State which is ambitious enough to hold Olympic Games every year may progress to the holding of annual games once a week?

MARION HARLAND

JUST as Mark Twain was so universally known by that name that it is hard to think of him as Samuel Clemens, so has Marion Harland been a name far more familiar than that of Mary Virginia Terhune, who died on June 3 at the age of ninety-one. It is probably practically correct to say, as one writer does, that "there was no American city so great, no crossroads village so remote, but that the name of Marion Harland was as familiar there as if she had been a President of the United States."

This is not because she was a great writer; her stories were mild, friendly, and gentle—the reverse of the high-flown fiction of her contemporaries Ouida, Augusta Evans, and Mrs. Southworth. It was rather because of her long-continued, sincere interest in American home life. She edited or ran departments in periodicals like "Babyhood" and the "Home Maker," wrote for newspapers, sent out a large number of syndicated home articles, edited a famous cook-book, collaborated with several members of her family in books relating to the nursery and the kitchen, and wrote much and wisely about married life and home-making. In a special sense "Marion Harland" became a household word.

It is doubtful whether any other American woman has had a longer career as a writer. Mrs. Terhune began

to write when she was sixteen, and kept on writing for almost seventy-five years. When an accident crippled her wrist, she learned, at the age of eighty-five, to use a typewriter and kept on working. Quiet, steady persistence in continuing her usefulness was the predominating feature of her life. Her influence always made for good because she was persuasive rather than dogmatic, and because she dealt with the common things of life in a helpful fashion.

PUNDITA RAMABAI

It would be hard to exaggerate the extent and value of the work for Hindu women accomplished by a Hindu woman. Ramabai, in education, in social knowledge, and in the development of that spiritual quality that underlies all religion.

Ramabai's father was a man of liberal views for his time and country; yet she was married when only nine years of age. Fortunately, her husband, a learned Brahman Pundit, took the almost unheard-of course of giving his wife a scholarly education. In time she became the foremost woman Sanskrit scholar of India. After her husband's death, she conceived the idea of helping child widows in India. This plan brought her to America, where she saw and talked with many people of influence and addressed audiences in scores of churches and lecture-rooms. The result was the organization of the Ramabai Association, which had the cordial support of Edward Everett Hale, Phillips Brooks, Frances Willard, Lyman Abbott, and many others. For thirty-five years it has helped to carry on the school instituted by Pundita Ramabai in the city of Poona, its Hindu name signifying the "Home of Wisdom." Ramabai's own name, we are told, means "Delight Giver." At first it was open only to high-caste child widows, and was carried on under the rigid rules of Hindustan as to cooking, living, and worship. Later Ramabai herself adopted the Christian faith.

A period of persecution from some of the Hindus of influence who had at first approved the enterprise was followed by the gradual winning over of many of the leaders of her people. In a terrible famine that swept over India and left thousands of orphan children the service done by Ramabai was notable, and it was this that led to the extension of the service of the school to girls not of a high caste. It is said that at times over eighteen hundred women and girls were under her care, although no assurance existed for the support of more than eighty or one hundred girls in the institution itself.

The Shāradāc Sadan, as the school was originally called, expanded so that

RAMABAI—HER LAST PORTRAIT

Ramabai's entire mission included a large orphanage, a rescue home, a school for the blind, and the teaching of many industries—farming, weaving, printing, dyeing, and so on. A task of almost unbelievable difficulty was her translation of the only Hindu edition of the Scriptures available from the classic form, in which it was useless to the village people, into a popular version.

The work that this remarkable woman started and extended in India will survive her death, which took place recently, and provision has been made for that purpose. In this country the Ramabai Association will continue to forward funds for the purpose of carrying that work on through a well-known American missionary in India, the Rev. Dr. Robert A. Hume.

At a memorial service held in Bombay representatives of the Indian Government and press and of the women of India declared by resolution that the death of Pundita Ramabai was a loss to the whole country, and particularly to the Christian community.

WHAT IS
SUMMER READING?

TAKE along a book," is the excellent slogan of the summer reading campaign now in active progress—but why "a book"? "Fiction for Vacation Satchels" is a newspaper headline for a review of a dozen and a half novels which have just one thing in common—they are all new. But if this is over-inclusive, the next headline we meet is too restricted, for under the broad title "Summer-time Fiction" a paper reviews three books, two of which are detective tales and one a "placid, gentle narrative of an autumn wooing"! If any editor has a particularly vapid lot of fiction on hand, he heads it "Vac-

tion Reading." But one worthy religious board of publication very soundly advises us (in its summer advertising) to avoid "Feather-Weight Fiction or Millstone Philosophy."

In the main, the advertisers who are urging people not to forget to read something in vacation lay too much stress on the idea that only the lightest of light fiction can be read with enjoyment during the summer. If they mean by light reading entertaining reading, well and good; but the emphasis seems to be laid on the idea that nothing is not "light" that does not deal with murders or flappers. The intelligent person doesn't lose his intellect or his taste during the months which have no R in their names. The book for a real vacationist, says one propagandist in the "Take a Book" campaign, "mustn't occupy the mind much, for then it would not be a real vacation or week-end. It should occupy the mind just a little bit, sort of titillate it, as it were."

Why not assume, on the other hand, that if one wants entertainment he wants it to be of good quality in summer as well as in winter; that he wants a first-class novel, a book of real humor, or a book of reminiscence abounding in stories? Don't let any of us encourage the over-production of silly fiction under the notion that anything is good enough for the dear old summer-time.

In an article by Marguerite Wilkinson in the "Summer Reading" special number of the "Publishers' Weekly" we find two interesting suggestions. The first is a little fantastic, perhaps, but it has a logical point:

The right sort of book to take on a vacation is the sort of book that we seldom or never read at home, or the sort of book that tells of a life remote from the moods and thoughts of our own workaday existence. Teachers should find books of the most devastating humor, or the wildest detective stories. Clerks, stenographers, salesmen, and others who work in figures should read the world's dearest old romances and much poetry. Tired ministers should get hold of tales of adventure in the open air and books of exploration into far countries. Perhaps Shackleton's "South" would be a good beginning. Poets should have sedative literature in the summer-time—preferably garden manuals and cook-books, say "Things Mother Used to Make." Honest lawyers should read fairy tales, perhaps "Irish Fairy Tales," by James Stephens. The nervous stock-broker should fill his pockets full to bulging with the poetry of Walter de la Mare. . . . William Jennings Bryan should buy a whole library of modern books on biology.

The other suggestion is one that we enthusiastically indorse—that the vacationist take with him at least some books he has always wanted to read and hasn't. We know that this entails a lit-

tle trouble and thought, but it will be worth while. It is not necessary to go back to the Victorian age and read Dickens or Thackeray. Probably most people could pick out three or four books published within the last three years which they know to be worth while but haven't happened to see. Or take the last year alone; here is an off-hand list of a dozen or more books which have made a distinct success. Perhaps you have read them all; if not, now is your chance; they are not out of print:

John Burroughs's "Boyhood," Depew's "Memories of Eighty Years," Van Loon's "Story of Mankind," "The Mirrors of Downing Street," Raymond's "Life of Balfour," Strachey's "Queen Victoria;" and in fiction Tarlington's "Alice Adams," Sabatini's "Scaramouche," Hutchinson's "If Winter Comes," Galsworthy's "To Let," Louis Hémon's "Maria Chapdelaine," Kaye-Smith's "Joanna Godden," Caine's "Mendoza and a Little Lady," Quick's "Vandemark's Folly."

Every one of these books has entertainment in it. The point is for each vacationist to think out for himself or herself something that will increase the pleasure of vacation time and not grab the first thing that offers because it is said to be "light" (meaning feathery) or because it was published day before yesterday.

And, by the way, how about re-reading an old book that you rejoiced in greatly when you first read it? There are those who in the realm of adventure would a hundred times sooner re-read "Kim" or "The Cloister and the Hearth" than all the Zane Grey or E. P. Oppenheim literature that may flow fresh from the press for the next twenty years.

THE TRUE REACTIONARIES

AMERICA has inherited its principles and institutions of liberty from two sources. One of these sources is English; the other, French. And for the preservation and increase of that inheritance America is under obligation to her own sons from the days of the wilderness, through the days of the Revolution and the Civil War, to the present.

Many Americans, some of them professing to be intellectual guides and some of them in position of political leadership, seem to have forgotten this.

It is as a reminder to such as these that a letter recently published in the newspapers from Charles W. Eliot, President Emeritus of Harvard, deserves the widest circulation. We print it herewith in full.

A people whose rights, won slowly

PRESIDENT ELIOT ON BOLSHEVIST RUSSIA

OUR National Administration is apparently acting on the belief that the American people wishes to avoid entering into European politics, though willing to join in economic measures for the restoration of European industries and European national budgets and credits. I submit that this separation of politics and economics is not expedient, or even possible, in the case of Russia.

The fundamental proposition on which the Bolshevik Government was based is, to be sure, an economic one, namely, no private property, no family property, and no transmission of property in a family; but on that foundation a political Government was suddenly created by savage violence on the part of a small minority of the population, and that Government proceeded to rob and kill a considerable proportion of the property-holders of the country, large and small, and finally to rob and enslave the labor employed in the manufacturing industries of the country. This same Government undertook to win the support of the agricultural peasantry by giving them elusive deeds of the lands they had been accustomed to cultivate as tenants; but the great agricultural class, while they accepted these deeds, refused to accept or support the Bolshevik Government. That Government has also crushed completely, both physically and morally, the educated middle class in Russia, which has not only been deprived of its property but of all intercourse with thinking people in neighboring nations, and in America also.

This Bolshevik Government now finds itself in dire straits without credit, and without power to reconstruct Russian factories or Russian transportation; and yet it still insists at Genoa and elsewhere on all its monstrous social and economic fallacies, and proposes that other governments or peoples shall lend it billions of dollars without any security whatever for the repayment of the loans.

I submit that the United States should neither forget nor forgive the monstrous crimes, cruelties, and follies of this Bolshevik Government, and should wait to give aid to Russia, except food for the starving, until that Government is dead and buried. In this sense, and in regard to this nation, it seems to me impossible to separate in American National action European politics from European economics. The American democracy should not only take to heart the lessons of the Bolshevik horror for the present generation, but should do its full part in making and recording the history of the Bolshevik crime to the end of the chapter.

In that course of conduct the present Administration can rely on the well-nigh unanimous support of the American people, who heartily detest the political as well as the economic theories of Bolshevism.

CHARLES W. ELIOT.

Cambridge, Massachusetts, May 17, 1922.

and painfully through the centuries, are recorded in such historic documents as the Coronation Oath and Charter of Henry I, the Magna Charta of 1215, the Petition of Rights of 1628, the Habeas Corpus Act, the Bill of Rights of 1689, the Virginia Bill of Rights of 1776, the Declaration of Independence of the same year, the Articles of Confederation, and the Constitution of the United States, and are embedded in the common law, should be unable to witness the violation of those rights anywhere in the world without repugnance and a sense of outrage. Certainly no American ought willingly to lend himself to any scheme or plan or proposal that tends to lend the countenance of his country to men anywhere in the world who, having seized power by the violation of such human rights, seek to maintain their power by gaining the recognition of the Government of this free country.

Besides this love of liberty as a right, which Americans have inherited with

free institutions from England, they have also inherited from France a love for liberty as an ideal. If the spirit of freedom which has come from the British Isles is the more sturdy, the spirit of freedom which has come from France is the finer and more generous. This is the spirit that raises freedom from the plane of privilege to the plane of duty. Liberty is something more than a definite prerogative that the citizen has obtained and will not let go; it is also a goal toward which he knows the nation of which he is a part is moving. As liberty has come to America from France, it is not merely an individual possession which each citizen prizes; it is a common possession demanding reciprocal service. Liberty thus conceived is incomplete without equality, and equality is incomplete without fraternity. It is this ideal, derived from France in the early days of the two republics, that has made of America a nation of idealists. For this reason Americans who have received their full

inheritance are not only jealous of their own rights but responsive to appeals for the defense of the rights of others.

It is not altogether strange that Englishmen, who themselves are free, but who are not necessarily jealous for the freedom of other people, can contemplate with comparative equanimity the oppression of the Russians under their Bolshevik tyrants; but it is strange almost beyond belief that there should be Americans, particularly Americans who call themselves liberals, who can go so far as to support the proposed policy of giving aid and comfort to these worst enemies of liberty that have risen to power in modern times. The Bolsheviks are even more dangerous than the Czar and his Black Hundreds, for they have employed the art of the demagogue as well as the force of the tyrant in destroying what there was in Russia of free speech, free press, free assembly, courts of justice, and every other element or form of popular liberty. Tyrants sometimes excuse their practices on the ground that they are the necessary instruments for the preservation for order and prosperity; but the Bolsheviks have not this excuse, for their dictatorship has involved their country in turbulence and economic ruin. This is something which no one any longer pretends to deny. Those Americans who, like Senator Borah and the editors of some so-called liberal journals, would give to these tyrants the invaluable reinforcement of America's official recognition are in the minority. The Government of the United States, alike under the Democratic Administration of President Wilson and the Republican Administration of President Harding, in refusing to recognize the Bolsheviks, has been moved by American love of liberty as well as American common sense.

Naturally America at this time finds herself more in sympathy on the Russian question with France than with England. Under Lloyd George, England is as free from the danger of Bolshevism within her own borders as any country well could be, for Englishmen would make short work of any English Lenins or Trotskys; but England is not averse to getting trade where she can find it, even though in the process she makes bargains which strengthen the hold of dictators. France, on the other hand, is distinctly uncomfortable in even sitting across the table from the Russian Bolsheviks. The French lent their money to the Russian Government of the Czar, not because they loved Czarism, but because even Czarism was a bulwark against the worse tyranny of a menacing Prussia; but they distrust Bolshevism, not only because it is a repudiator of justice, but because, after the

Russian people had overthrown the Czar, Bolshevism established in its place a more cynical and remorseless tyranny. On another page Mr. Baldwin, of The Outlook's staff, writing from Genoa, reports, not merely the point of view of the French Government with regard to Russia, but the point of view of the French people. Ever since the peace of Brest-Litovsk the French as a nation have viewed the rulers of Russia with loathing, because those rulers have proved themselves disloyal to the cause of liberty not only in their own land but throughout the world.

In a note to the Powers, the Premier of France, M. Poincaré, has recently marshaled arguments to show the uselessness of attempting a solution of Russia's economic troubles and conflicts with the rest of Europe until Russia through its Government recognizes principles of "public law and honor about which there can be no bargaining." Even in this economic argument, however, there is implicit something more fundamental than questions of economic interest, for it is plain that beneath it all is the feeling of France for that "human solidarity," to use M. Poincaré's own phrase, "which impelled the democracies of western Europe to help the Russian democracy," and the consequent resentment against those dictators in Russia who have done their best to destroy the Russian democracy and to that extent thwart the purposes of those who fought for the ideal of liberty.

To-day the true reactionaries are those, whatever their guise, who would give aid and comfort to the Bolshevik tyrants, and thus attempt to turn the world backward into the age of despotism.

THE COST OF CAMPAIGNING

SENATOR HARRISON, of Mississippi, has had a severe shock to his sense of political morality. He has discovered that Gifford Pinchot spent approximately \$120,000 in the course of the recent pre-primary campaign in Pennsylvania which won for the former Forester of the United States the Republican nomination for the Governorship.

Senator Harrison does not allege that any of this money was spent corruptly. He does not allege that any votes were bought or any political leaders subsidized. The mere fact that Mr. Pinchot spent this horrendous sum for publicity and that he happens to be rich enough to finance his own campaign has been sufficient to bring the blush of shame to the cheeks of the junior Senator from Mississippi. Whether the Senator would

have blushed quite so furiously had Mr. Pinchot been running in a Democratic primary we do not venture to state.

The trouble with Senator Harrison and those who support his attitude, whether from pseudo-liberalism or political expediency, is that their conception of modern political needs is limited by standards set by the campaign necessities of a village politician.

Pennsylvania is not a village; it is a great Commonwealth numbering nearly 9,000,000 souls. At the last Presidential election the voters of the Keystone State cast more than 1,800,000 ballots. To send a single circular to each of these voters would cost at least \$54,000. Of course there are more voters in Pennsylvania than put in an appearance at the polls during the last election, and all of them might properly be circularized. It would require a political clairvoyant of no mean order to determine which sovereign electors would attend the polls on election day and which would spend those hours on a baseball diamond or on a golf course. They must all have the issues of the campaign put before them.

We have given the cost for circularization as an indication of the size of one item of legitimate political expenditure. The reader can easily imagine how much more might be advantageously and properly used in an advertising campaign in local newspapers and in the hiring of public halls.

Since we have adopted the primary system, the elector is certainly entitled to know as fully as possible the qualifications of the various candidates. The question at issue is not, "Shall these primary elections be costly?" but, "How shall that cost be met?" In the case of a Pinchot the candidate can draw upon his own ample means. In the case of a Leonard Wood friends of the candidate willingly bear the expense. Those who have criticised Pinchot in the present campaign and Leonard Wood in the last Presidential campaign are futilely barking up the wrong tree. They should set their brains at work devising a system under which both the poor and the wealthy candidates will have an approximately equal chance to reach the ears of the public. Possibly a modification of the Oregon plan, under which candidates are given space to print their objects and platforms in a pamphlet issued at the expense of the State, may some time be applied all over the country to primaries as well as general elections. The plan offers at least a hope of a solution, without the need of the expenditure of large sums from private funds, in accordance with the public right to know the facts and the public need of giving every candidate his or her day in court.

"THE QUESTION OF THE PACIFIC"

SPECIAL CORRESPONDENCE FROM WASHINGTON

BY HENRY L. SWEINHART

(C) Harris & Ewing

OPENING SESSION OF THE CONFERENCE OF REPRESENTATIVES OF CHILE AND PERU IN THE HALL OF THE AMERICAS, PAN-AMERICAN BUILDING, WASHINGTON

On the platform, left to right (front), are: Señor Carlos Aldunate (Chile), Dr. Luis Izquierdo (Chile), Secretary of State Hughes, who delivered the address of welcome; Dr. Melton I. Porras (Peru), and Hernan Velarde (Peru)

WASHINGTON, which was the scene only a few months ago of a great international meeting in which problems of the Pacific were discussed and settled in connection with an agreement on the limitation of armament among the leading Powers of the world, is to-day playing host to another conference at which "the question of the Pacific" is being debated. This time it relates, not to the Far East, but to South America.

The territorial controversy over which Chile and Peru have been divided for almost forty years past, and in which Bolivia also claims an interest, is commonly known in the countries interested, as well as in a large part of South America, as "the Question of the Pacific." It is a debate as to whether the geographically small departments of Tacna and Arica, constituting together the province of Tacna, shall be assigned permanently to Chile or to Peru. Originally they were Peruvian territory; since the war between Chile on one side and Peru and Bolivia on the other, ended by the Treaty of Ancon in 1884, they have been in the possession of Chile, subject on the question of final ownership, however, to a plebiscite which was to have been held in 1894, but which it has never been possible to hold because of failure of the two countries to agree on the conditions under

which the plebiscite should be conducted, the principal contention being over the question as to who should be eligible to vote.

Now Chilean and Peruvian delegates are in Washington trying to find a means of settling this problem which has been of such long duration and which has been by far the most difficult and delicate which has been faced by any of the South American countries. In this Tacna-Arica dispute practically all of the nations of South America are interested; in fact, it is a matter of vital concern to the future of Pan-Americanism. For the South American countries it was a perpetually threatening firebrand which might at any moment start a conflagration which would involve a number of the nations.

Should it be left to the possible arbitrament of arms, or settled by the arbitration of peace? That was the question which has been in the minds of many students of international affairs for years past. A propitious moment offered shortly after the adjournment of the Conference on the Limitation of Armament, and President Harding seized the opportunity to invite Chile and Peru to Washington to conduct their negotiations. Chile and Peru, although having no direct diplomatic relations, had started telegraphic communications between their Foreign Of-

fices in an effort to reach a direct agreement on the Tacna-Arica question. They reached an *impasse* and would have been obliged to break the negotiations which they had begun, when President Harding informed them he "would be pleased to welcome in Washington representatives which the Governments of Chile and Peru may see fit to appoint, to the end that such representatives may settle, if happily it may be, the existing difficulties, or may arrange for the settlement of them by arbitration."

The invitation was accepted, and the conference opened in Washington on May 15. The scene of its meeting is the Pan-American Union building, where the principal committee meetings of the Conference on Limitation of Armament were held, and where the Japanese and Chinese settled the Shantung question.

The Chilean and Peruvian delegates came to Washington with the purpose of trying to reach a "direct settlement" of their differences. The American Government was only the host, offering a friendly atmosphere in which the delegates could pursue their discussions. The United States has not participated, to date, in any of the conferences of the delegates, and has not even had an "unofficial observer" in attendance at any of their meetings. It has remained entirely outside the efforts which the delegates of the two South American countries have been making to reach a direct settlement, and has been maintaining an entirely open and impartial view on the subject.

The position of the Chilean Government, which meets with popular support, both before the conference started and since has been that the basis of settlement must be the "unfulfilled provisions of the Treaty of Ancon," providing for the holding of a plebiscite to determine the ultimate sovereignty of the disputed territory.

The Peruvians, on the other hand, took the stand that there should be revision of Article III of the treaty, the principal "unfulfilled provision," because of the fact that the plebiscite, which should have taken place in 1894, had been postponed indefinitely; and that conditions since that time had so changed that a ballot to-day in Tacna-Arica might be the reverse of what it would have been if carried out at the date fixed by the treaty, or even at some intervening period.

These two points of view are so far apart on a vital feature of the whole issue that, in the opinion of many close observers, it is believed a "direct settlement" of the problem is not possible and that arbitration is the only way out. The delegates of Chile and Peru met, and after a number of informal conver-

sations presented to each other their proposals as to methods by which they thought the problem might be solved.

The Chileans submitted four optional proposals: namely, hold a plebiscite according to the conditions of the agreement entered into by both Governments in 1912, Peru, should she think fit, to propose a modification of the time limit; or adopt as a basis of discussion the proposals presented in 1909 by Dr. Porras, then Peruvian Minister of Foreign Affairs and now chairman of the Peruvian delegation to the Washington conference, with such modifications as the Chilean delegates might propose; or submit to arbitration the differences which have arisen during previous negotiations in regard to holding the plebiscite; or, finally, putting aside pre-

vious negotiations, discuss conditions for holding the plebiscite, submitting all differences to arbitration.

The Peruvian proposals, submitted at the same meeting, suggested, first, that Chile surrender Tacna and Arica because more than twenty-eight years have elapsed since the date when the plebiscite should have been held, Peru claiming that a popular vote at that time would have been in her favor; or, second, that an arbitrator should decide if under present circumstances a plebiscite should be held or not. In case of a negative decision, the arbitrator to decide which country should have possession of the controverted territory. In case of an affirmative decision, the arbitrator to decide on the conditions under which the plebiscite should be held.

Both sides have declined to accept the other's proposals; and here they stand. Apparently they have reached an *impasse* which remains to be broken.

The means for breaking this *impasse* is contained in the proposals themselves, in which both Governments accept the principle of arbitration. What remains now to be accomplished is to find a way satisfactory to both sides of submitting their differences to this arbitration.

What will be the exact formula of arbitration remains to be decided. Who will be the arbitrator is known.

Although no official approach has yet been made, it can be stated authoritatively that the United States alone will be asked by Chile and Peru, after they have signed a protocol of submission, to arbitrate their differences.

A SOCIAL GOSPEL—TWO VIEWS

114 Centennial Avenue,
Sewickley, Pennsylvania.

DEAR DR. ABBOTT:—I have with interest read your paper on "A Social Gospel." I was surprised that you should say that the Gospel of Christ is primarily social. Let us test the correctness of this. According to Matthew and Mark, the first two texts of Christ were: "Repent, for the kingdom of heaven is at hand," and "Repent, and believe the gospel." But repentance and faith are both individual duties and experiences. The first conversation of Christ recorded by John was with Nicodemus, in which Christ told him he "must be born again," that a new birth by the agency of the Holy Ghost was necessary to his being admitted into the kingdom. Regeneration is an individual experience essential to a place and usefulness in the society which Christ came to establish. Christ early in his ministry met two men who were fishing, and said to them, "Follow me," and they left all and followed Christ. Following Christ is certainly primarily individual.

In all this Christ was laying a foundation, was dealing with primary religious duties and experiences, and nothing is said as yet about their social bearing. Christ gave his Apostles individual treatment for three years before they were regarded as fitted for their social work. He tells them when they pray to "enter into their closet, and having shut the door, to pray to their Father in secret." There is no influence in its purifying effect on the heart comparable with that of having it come into a hand-to-hand encounter with God. The first step which the prodigal son takes is to be reconciled through repentance to his father, the second is to enter into social service in the family.

Of course it may be said that all Christ's work—his calling men to believe and repent as well as his ministry to the sick—was social work. But Christ needed no special preparation for

that work except to be clothed in our human nature. The case is different with us. He needed no repentance, no new birth. There are ways in which we cannot imitate Christ. It was such facts as I have alluded to that led Vinet to say, "Christ came to establish individual religion," and that led Professor George Adam Smith to say, "The individual is the religious unit." One must become something in himself before he is fitted for the social service that Christ requires. I trust that I shall not be misunderstood. Christ came not only to establish individual, but also social religion.

The two elements rightly understood are in perfect harmony. The two elements are both necessary, they are mutually complementary. They act and react on each other to a degree of which, as of the physical law, it may almost be said that "action and reaction are equal." But let us keep things in their right order, in their divinely arranged relations. There is truth in the arrangement of truth as in particular truths. The disarrangement of truth impairs the force of truth, may lead ultimately to the denial of it. To put in the second place a truth or an element of the religious life which Christ and all genuine religious experience place first is to impair Christianity. It is to revert to a preparatory and imperfect dispensation. The prophets spoke to society, that is, to the nation, and only through the nation to individuals. This was done as a divine accommodation to the imperfect conception of individuality which prevailed in that age. The method failed. The nation became corrupt, and its doom was sealed. At the exile religion was in danger of becoming a stranger in the earth. It was cast in dependence for its life on the hearts of individuals. A new covenant was to be given, written not on tables of stone, but on the fleshy tables of the heart. This prepared the way for individual religion and the ministry of Christ, who comes

to each man and calls his "sheep by name."

Our fathers may have erred in not laying sufficient emphasis on social religion. Our present-day pulpit is in danger of emphasizing too little the importance of individual religion. The true method is not only Christian, it is democratic. The Socialist must hail with joy a method of preaching which sacrifices the individual to society. They who do that will find in the end that they have not only sacrificed the individual, but society itself.

Faithfully yours,

WILLIAM O. CAMPBELL.

April 28, 1922.

This letter seems to me to supplement rather than to contradict the article which it criticises.

The contrast so frequently drawn between an individual and a social Gospel seems to me unreal. We cannot build a seaworthy ship out of rotten timber, nor an efficient army out of cowardly and unpatriotic soldiers, nor a kingdom of God out of men who acknowledge no loyalty to God. The character of its members determines the character of the society; but it is also true that the character of the society forms and fashions the character of its members.

The unity of the social and the individual obligation is a distinctive characteristic of the religion of the Bible. That religion is the only one which emphasizes the truth that only by perceiving and performing our duties toward our neighbors can we perceive and fulfill our duties toward God. Nicodemus needed to be born again because he was a teacher of the philosophy of Pharisaism, and the Pharisaism which he represented recognized no social duties. The people of Israel needed to repent because they did not believe in a kingdom of God, they only believed in a kingdom of Israel from which all pagans would be cast out. Of the Ten Commandments, six relate to social du-

ties: respect for parents; regard for the four fundamental rights of man—his right to his person, his property, his family, and his reputation—and this a heartfelt regard. Two-thirds of Micah's definition of religion involves social duties—doing justly and loving mercy. One-half of Christ's religion involves social duties: Thou shalt love thy neighbor as thyself. Inhumanity to man is customarily treated both in the Old Testament and in the New Testament as the greatest of crimes against God.

If one turns from this general survey to a more special study of Christ's ministry, the social Gospel occupies in his preaching a not less prominent place. He came proclaiming that the kingdom of God is at hand, and to Jew and pagan alike a kingdom of God was a new social order. In his first recorded sermon he declared what he had come to do: to proclaim good tidings to the poor, release to the captives, sight to the blind, liberty to the oppressed. And if any reader will turn to the Sermon on the Mount as reported in the fifth, sixth,

and seventh chapters of Matthew, he will possibly be surprised to see how largely it deals with social duties.

My correspondent thinks that "our present-day pulpit is in danger of emphasizing too little the importance of individual religion." I think it is in danger of emphasizing too little the importance of any religion and substituting therefor social theories, and theological theories, new and old. The author of "Painted Windows" says of Miss Maude Royden, just returning to her English home after a brief visit to this country: "Miss Royden preaches Christ as a Power, . . . a Power that works miracles, that can change the habits of a lifetime, perhaps the very tissues of a poisoned body, and can give both peace and guidance to the soul that is dragged this way and that," and the author adds: "One may be pardoned for remarking that this is a rather unusual form of preaching in any of the respectable churches." Whether this is true I do not know. But certainly there never has been a time when so many young men and young women wanted this

Power as now. But they want it to use in social service. Because the Church has failed to give them the Power and the opportunity to use it, they have in my lifetime created four new organizations: the Y. M. C. A., the Y. W. C. A., the Salvation Army, and the Red Cross.

Christ condemned the Pharisees because they could not read the signs of the times. The signs of the times in our age and our country appear to me unmistakable. The questions which have compelled our attention have been not theological but social. They have been such as the Slavery Question, the Temperance Question, the Educational Question, the Immigrant Question, the Labor Question, the International Question. They have been questions of human brotherhood. To study these questions, to see their relation to the kingdom of God and so to preach as to give the congregations some understanding of them and some Power to deal justly and wisely with them, appears to me a primary duty of the Church of Christ.

LYMAN ABBOTT.

THE VOICE OF FRANCE

EDITORIAL CORRESPONDENCE FROM GENOA

BY ELBERT FRANCIS BALDWIN

IN certain circles you hear talk to the effect that France went to Washington and has come to Genoa really wanting to wreck the Conferences at these places.

France wanted to wreck neither. Nor has she wrecked either.

What she has done in the two Conferences is (1) to describe what she sees and (2) to tell what she thinks that she and the other nations ought to do.

In seeking information on these two subjects, I have talked every day with members of the French delegation and with French journalists and observers here. They willingly accorded me this privilege because in their publicity they wanted above everything to see published, not so much what more or less informed American and other foreign journalists think, as what the French themselves say from their own point of view. As I have understood it, here is the collective voice of these diplomats, journalists, and observers.

WE French have the power of seeing clearly. Hence our policy is a policy of reality. It is precise and concise.

In Germany we behold our hereditary enemy. Three times in a century Germany has invaded our soil. Our frontier is not favored and protected like England's, surrounded by water; ours is a frontier in large part contiguous with that of other countries—Spain, Italy, Switzerland, Belgium, but especially

Germany. Across our eastern frontier we see our enemy, Germany. With her powerful and untiring economic force, her continual increase of population (Germany's population is more than 60,000,000 now as against our 37,000,000), and, above all, with her tenacious ambitions, she counts on avenging one day her defeat of 1918.

In 1914 she let loose a war the greatest and bloodiest in world history. She has had to suffer the consequences of her defeat.

One of these consequences was to see her army reduced by her conquerors, as per the Treaty of Versailles, to 100,000 men. But she is not really disarmed, because she has always at command police forces, well organized under local authorities, that could swell her army within a week or two to about 2,000,000 men. France has already reduced the term of military service from three years to eighteen months, and under this régime it now numbers some 450,000 men. She would like to reduce it further to a year, but, in face of this German preparation, finds it impossible.

Another of the consequences of German defeat was the necessity of paying reparations, though by the Versailles Treaty with her the victors in the war condemned her to pay only small damages in proportion to the losses she caused. But what do we see? Germany declines to honor her own signature! Making use of a bankrupt's tricks, she tries to escape her treaty promises.

Here at Genoa we recognize three of Germany's aims in coming:

First, by the Russo-German treaty (concluded before the beginning of the Conference, but signed here after the Conference had convened) she wishes to make of Russia an instrument of her vengeance.

Second, Germany, as well as Russia, wishes to betray the conditions and principles accepted in coming here.

Third, Germany wishes, as a chief aim, to break up the Entente, and specially to separate England and France.

As to Russia, we think first of all of the great Russian people. During the first years of the war the Russians fought nobly for the common cause, and in keeping such a large part of the German army on the German eastern frontier contributed much to our victories in our eastern provinces. The Russian people should not be blamed in any way for what occurred during the Revolution of 1917; that Revolution was engineered by less than one per cent of the population. We should now aid the Russian people to emerge from their present misery.

When we speak of the Bolshevik Government, we know that it is only a façade. Behind this façade there is nothing with much possibility of long duration. The Bolsheviks have turned Russia upside down. Her real enemies are her actual dominators.

And they are the real enemies of

Europe and of the world. Germany, in coming to the Genoa Conference, had as an aim to divide the Entente. So had the Bolsheviks. But they had also another aim. They wanted to see France respond to a German *non possumus* as to promised payments by measures of coercion which would deliver Germany into the hands of Anarchists and Bolsheviks. So the conflict between Bolshevism and civilization is still to continue!

The Bolsheviks are now at the end of their tether. Hence, with their hands still dripping with the blood of their victims, they ask the capitalists to return to Russia. Despite what the Bolsheviks say, the Russians have really nothing to sell abroad. The aim of the Bolsheviks, therefore, is to obtain a loan and—what impudence!—from victims like ourselves, to whom Russia owes money, for in Czarist times we lent her many billions of gold francs. In those times Russia was great and prosperous, but the Bolsheviks have now destroyed all her wealth.

In England we see a friendly Allied nation, but also a nation, above all, commercial. She has lost two clients, Germany and Russia. She wants to get them back. But at what a price! At the Conference at Paris English influence opened to the Germans more than one way of escape in the Treaty of Versailles; later, in the Upper Silesian question, England acted as if she wanted to sustain German claims.

As to the Bolsheviks, England indicated to Poland the desirability of signing a peace treaty which would have given over that country to those brigands, hoping thus to put herself in their favor; later England herself concluded a separate commercial arrangement with them.

When we reproach our English friends with all this, they retort that we occupied Frankfort separately and that recently, in violation of formal engagements, we concluded an arrangement in Asia Minor with the Kemalists. But the provisional occupation of Frankfort was authorized by the Treaty of Versailles. The occupation had been provoked by an infraction of the Treaty. Without authorization, Germany sent her troops into the neutralized zone. In such a case the Treaty authorizes the respective Governments to take what measures are necessary in the circumstances. As to the Kemalist arrangement, England was aware of our preparations.

In any case, here is our duty towards the nations represented at this Conference. We have thought that we ought to come to Genoa, not to oppress any nation, but to have a little more justice for ourselves and for the whole of Europe.

Having been a rampart to the Allied armies in the war, the reconstruction of our devastated regions, we have the right to think, is an essential part of

the reconstruction of Europe. But we have no notion of sacrificing this reconstruction to our own. All the European nations ought to become prosperous.

For the reconstruction of Europe we want to obtain guaranties. For example, for the remaking of Russia a work of international co-ordination would not only furnish aid to encourage the production of her own elementary products, but would give by reason of commercial exchanges additional opportunity for the employment of labor in industries throughout the world.

In thus speaking, our duty is to think only of the great Russian people, and not at all of the Bolsheviks. We shall not capitulate to Communist doctrines. We shall not recognize the actual, unreformed Government. Such a recognition would basely betray civilization.

But the Bolsheviks ostentatiously declare themselves reformed! We know that the reform is not sincere. But suppose it lasts a certain time. Very well; then we demand a certain time in which to see proofs of the fulfillment of present promises.

Russia has always needed the rest of Europe more than the rest of Europe has needed her. Russia cannot do much without Western capital and products. And now it is that part of Russia which calls itself Bolshevik which wants European aid to prolong the Bolshevik Government's existence. Europe, therefore, has a right to show herself justly severe. Europe demands, among other things, that:

(1) The Bolshevik Government shall recognize the debts of the preceding Russian Governments.

(2) The Bolsheviks shall recognize the obligation of returning the properties confiscated or nationalized or shall give complete compensation.

(3) The Bolsheviks shall give guaranty that foreign commerce will be free from Government tyranny. Though the cupidity of certain traders impels them to "talk business" with the Russians, no government can encourage the shipment of its goods to Russia without guaranties concerning freedom of commerce.

With a really reformed Bolshevik Government something along these lines might be done.

In the same way, in Germany we recognize not only an enemy, but also the fact that, despite her military ambitions, she has been, and will be yet, a factor of progress and civilization. Nevertheless here also our duty is to demand guaranties, whether as to treaties or commerce. The Germano-Russian treaty recently signed (disloyal both to the Treaty of Versailles and to the principles on which the invitation to Genoa was based) has tried the patience of all the other nations. Naturally, such a treaty has resulted in encouraging pan-Germanism in Germany and Bolshevism in Russia. It is a warning for the rest of us. This treaty ought to have immediately been faced by, not a mere

Entente, but a Franco-Belgo-English alliance—a frank, energetic, intimate, sincere collaboration, a material but, above all, a moral solidarity. And so much the better if Italy were there too!

Great Britain and France are the main pillars of the European edifice. As Mr. Lloyd George said the other day, no accord can be obtained at this Conference without an intimate understanding between these two nations. They can save the situation. But for that they must be united.

Up to this point we are in accord with our English friends. But we want to obtain from them a firmer policy; no policy of retreat with regard to treaties and reparation. We want an alliance between England on the one side and France and Belgium on the other, on a footing of equality. By such an alliance France and Belgium should count on English protection against Germany and on Bolshevik recognition of Russian debts; by it England should count on the certainty of constant consultation with her by France and Belgium in everything concerning the peace of Europe, on their co-operation with her to the greatest extent possible, and specially on their acceptance of the English proposition of non-aggression with its respect toward existing treaties and sanctions.

Otherwise, France and Belgium will be forced to fulfill their duty as it seems just to them. They are not for a policy of isolation. They know that it would be a poor advantage for the European family. But, in order to have any alliance, they have no notion of making concessions in disregard of treaties to the conquered nations represented at Genoa, or of preparing the triumphal return of Communism. There is no endeavor to wreck a Conference in refusing adherence to not entirely moral principles, and, be it remembered, moral principles have been the foundation of this Conference. You would have acted as we have had you been officially represented here. But when other Powers see a check to certain of their enterprises, founded on unjust principles, it is not difficult for them to throw the responsibility upon us when we withhold our approval of their course.

Despite this, we are always ready for any reasonable negotiation with any loyal government.

So the voice of France sounds to me. Personally I would like to see in such an alliance as that above outlined also the nations of the Little Entente, with whom Poland is collaborating more and more. A good understanding between these nations and the Great Entente, if not an alliance, is more than desirable; in my opinion, it is necessary.

All this union ought to form a solid international block. On it one should count both for resistance to deceit and wrong and for strength in the reconstruction of Europe.

THE SHRINE OF A GREAT SPIRIT

THE LINCOLN MEMORIAL, AS SEEN FROM THE TOP OF THE WASHINGTON MONUMENT DURING THE DEDICATION CEREMONIES, MAY 30, WITH THE VIRGINIA HILLS IN THE DISTANCE

THE AMENITIES OF SCHOOLMASTERING

BY HOWARD BEMENT

THOSE who can, do; those who can't do, teach." So said some one whose name I have forgotten, and do not care much to remember. If his were the only slur cast upon schoolmasters, I should be content to let this paper remain unwritten; but even the most casual reader cannot go far without tripping over some allusion to the base-born character of my profession. Dionysius the Younger, Tyrant of Syracuse, fell in popular esteem to the bottom of the ladder when, banished from his city, he went to Corinth and turned schoolmaster, "remaining a tyrant still," as one contemptuous writer avers. Charles Lamb devoted a whole whimsical essay to the schoolmaster, from which that dignitary emerges a badly damaged article. "Passing from infancy to age," says the genial essayist, the schoolmaster "dreams away all [his] days as in a grammar school, . . . revolving in a perpetual cycle of declensions, conjugations, syntaxes, and prosodies. . . . He must be superficially omniscient. . . . Nothing comes to him not spoilt by the sophisticating medium of moral uses. The Universe—that great Book, as it has been called—is to him indeed a book out of which he is doomed to read tedious homilies to distasteful schoolboys. A boy is at his board, and in his path, and in all his movements. He is boy-rid, sick of perpetual boy. . . . We are never quite at our ease in the presence of a schoolmaster, because we are conscious that he is not quite at ease in ours. He is awkward and out of place in the society of his equals. He comes like Gulliver from among his little people, and he cannot quite fit the stature of his understanding to yours. He cannot meet you on the square. He wants a point given him, like an indifferent whist player. He is so used to teaching, that he wants to be teaching you. . . . The jests of a schoolmaster are coarse, or thin. They do not tell out of school. He is under the restraint of a formal and didactic hypocrisy in company. . . . He is forlorn among his co-evals; his juniors cannot be his friends." Thus, and much more, Charles Lamb.

"But this is a hundred-year-old picture," you may say. "We live in a more enlightened age, and the schoolmaster has come into his own." I wonder if he has. In a recent number of a popular weekly I lighted with eager interest upon an article entitled, "The Motive of the Critic." In the second paragraph I read: "Then he remains a mere reviewer of and valet to the ideas of his betters, and is of little more importance to the world than a schoolmaster, a newsmonger, or an auctioneer." Farther down that brilliant dismal page I read: "The young literatus just out of the university is put to writing reviews of

books, or plays, or music, or painting. Very often he does it extremely well, for even decayed pedagogues often do it. . . . Gradually he becomes, whether in or out of the academic grove, a pedagogue, which is to say, an artisan devoted to diluting and retailing the ideas of his superiors—not an artist, not even a bad artist, but almost the antithesis of an artist." As though this were not enough, I read toward the end of the article (not an article on schoolmasters, remember, but an article on "The Motive of the Critic"): "Pedagogues believe in immutable truths and spend their lives trying to determine them and propagate them; the intellectual progress of man consists largely of a concrete effort to block and destroy their enterprise"—the most unkindest cut of all. I tried to find comfort in the fact that the author of these strictures was a notorious iconoclast, who would rather round out an apothegm at the expense of the truth than utter a wise saw based on the verities. But I confess I was shaken, for I realized that I could compile, if I chose, a whole anthology of this sort of thing; and realized, worse still, that the anthology is already writ in two words redolent of the world's contempt—"pedagogue" and "pedant." And yet "pedagogue" is from the Greek, meaning "to lead a child"—surely the one word in all the descriptive terminology of my profession which ought to have preserved its inherent nobility; the one word more than any other descriptive of the teacher that has its patent in the dicta of the One Great Master: "Suffer the little children to come unto me, and forbid them not; for of such is the kingdom of heaven." "Whoso shall cause one of these little ones which believe on me to stumble, it is profitable for him that a great millstone should be hanged about his neck, and that he should be sunk in the depth of the sea."

THERE are those, however, in these later and degenerate days who dare to uphold the dignity of the schoolmaster in both press and forum; but most of these defenders are teachers themselves or their cousins german, or their wife's relatives, or college professors, whose attitude is too often that of a rich retainer condescending to patronize a poor relation. In strange and seemingly incongruous opposition to this prevalent view of the schoolmaster—the view of the many who curl the lip over "pedagogue" and "pedant"—is the generally popular conception of the dignity and worth of education. The poorest man consents to be taxed and the richest consents to be "touched" that education may not perish from the earth. The Rockefellers and the Carnegies give their millions and the States their tens of millions to support the schools. The

newspapers, the weeklies, and the magazines all unite to plead for fewer battleships that we may have more schools, as though every cent diverted from armor-plate would, as a matter of course, find its way into the brick and mortar of cloister or class-room. I shall not attempt to reconcile these anomalous views—the contempt for the workman and the respect paid to his work—but I shall attempt to rescue my profession from some of the odium attaching to it. The dignity of any work should dignify the worker; and teachers should therefore be able to find in their profession attributes of sufficient worth to save their pride and stipulate their courage. Let us consider, then, the real returns upon their investment of life in this hazardous enterprise of pedagogy—"child-leading." Let me point out what I conceive to be the amenities of schoolmastering, speaking first of its obligations, and then of its rewards and privileges. If I cannot dignify the profession in the eyes of scoffing critics (who taught them to write, I should like to know?), perhaps I can at least reconcile teachers to the position in which, by circumstance fortuitous or by choice determined, they now find themselves.

THE Obligations. The teacher must first prepare to teach, then sacrifice, by teaching, and then continue, ever and always, preparing to teach and making the perennial sacrifice. This is the perfect circle of his professional life. But he should never twice tread the same arc. Each new circle of preparation and sacrifice should be larger than the last, until his life describes as many concentrics as he has lived years; until each new circle, to paraphrase Holmes, nobler than the last, shuts him from heaven with a dome more vast, till he at length is free, finding his daily, hourly preparation a vast spiritual experience, and his daily, hourly sacrifice a noble self-emancipation. To vary the figure, the teacher must daily fill the reservoirs of his mind and heart, and daily must draw off the waters for the healing of his little nation of intellectually and spiritually sick pupils. He must perpetually be pumping and turning the spigot. He must daily acquire virtue, for daily is virtue going out of him at the touch of sick youth, maimed youth, lost youth. Christ healed the idiot boy when he came down from the Mount of Transfiguration. May we not assume that he could never have healed that lad in the valley had he not first spent the night upon the mountain-top?

What do I mean by preparation? The preparation should of course begin in college, but too often does not. The current stigma cast on teachers is too often attributable to those who do teach

because they cannot find anything else to do. They drift into the profession unprepared, and desultorily take up their duties; and they remain in the profession because they do not seem able to get out of it. They are the quasi-teachers, the pseudo-schoolmasters, pedagogues by courtesy. But not every man who comes to teaching with no special preparation but an A.B. degree is doomed to be a pariah of the caste; were that so, where should I be, and many another? The obligation resting upon each teacher is that he should spend some of every working day and much of every play day in preparing, not the lesson of the day, but the *subject* he is teaching; not the subject either as a thing remote and apart, but the background of that subject, with all its multifarious lights and shades, its foreground and its background. Imagine the cheap, imitation drops against which some teachers are daily miming before their classes! The rich setting that ought to adorn their stage is, I fear, a thing that even the most ignorant pupil is quick to miss if it be not there. How can a man teach, with the enthusiasm and vitality that ought to mark all teaching, the deadly grind of English grammar if he be ignorant of Shakespeare's syntax or of Chaucer's quaint inflections? How can a Latin master hope to vitalize his paradigms if he be ignorant of Cicero and Catullus, of Ovid and Horace? How can the French master hope to raise from the dead a French irregular if he be ignorant of the magic touch of French literature from Montaigne to Rostand? Not one of these things may be mentioned in the day's "perpetual cycle of declensions, conjugations, syntaxes, and prosodies;" but the teacher knows that he knows, and the boy knows that the teacher knows or does not know—knows it through some kind of canine nostril sense—and there you have all the difference. But there are not many classes in which the rich treasures of the teacher's background may not be rifled for the pupil's enrichment—and there, again, you have all the difference.

Nor does the teacher's obligation end with never-ceasing preparation of his subject. Lamb was right when he said that the schoolmaster must be superficially omniscient. He must know something of other subjects than his own. More than that, he must know much of professional technic. The history of education, the results of the study of child psychology, the recent development in the science of pedagogy, should be his mental pabulum. The plea that the teacher has no time for many, perhaps for any, of these things is a natural rejoinder. The answer, I suppose, is that he seems to take time for many things that are less worth while. In so far as he does so, is he not confessing that he is only a teacher by sufferance, and that he is not so wholly and interestedly devoted to his profession as are most lawyers and physicians and

preachers to theirs? I hold the profession of teaching second to none of these. Should I, then, absolve the teacher from reading his professional literature when I should berate that physician who did not keep up with the latest practice in appendectomy? Should you employ a doctor who did not subscribe to and regularly read the "Medical Journal"? Should you employ a lawyer whom you knew to be ignorant of the latest principles of legal practice? Should you pay \$1,000 a year to send your son to a school whose masters were ignorant of the best thought of ancient and modern authorities on how to do the thing you paid them to do; who were confessedly ignorant of those principles knowledge of which alone can qualify a man as an expert in the thing he undertakes to do? Teachers owe it to themselves, to their pupils, to their school, to their profession, to make of themselves skilled artisans, qualified to work in the materials they are set to fashion.

This stern regimen should be in no wise a damper to enthusiasm nor a lion in the path. It should be, and will be, to every right-thinking teacher a challenge and an inspiration. If earnest and never-ceasing thirst for knowledge is not his, how can he, in all conscience, ever again speak word of reproof to dull, reluctant youth? Let him not, in any event, be hypocritical; let him not strive to cast out the mote from the student's astigmatic eye until he has first cast out the beam from his own purblind one. May we not, then, summarize the whole matter of the obligation of the teacher, and do it simply and broadly? *It is his duty to grow, and to become increasingly productive.*

THE Privileges and the Rewards. "Yes," says the disgruntled schoolmaster, "it is a rare privilege to 'have a boy at your board, in your path, in all your movements; to be boy-rid, sick of perpetual boy.' It is a privilege, indeed, to live a life of killing routine, the body-slave of bells, the servile minion of monotony. It is a privilege to be 'the hired man of an autocratic principal,' seldom praised, often blamed, and in danger each year of summary or of polite dismissal. It is a privilege, I suppose, to grub for a pittance and die in a poorhouse, content to accept my final reward in heaven, since none has been vouchsafed me here."

Now, every one of these complaints is literally true; and yet I quarrel with the schoolmaster who makes them, for the very reason that in the making he has deliberately classified himself in that group of pedagogues described by Lamb and sneered at by the critics. Unless the schoolmaster can magnify his joys and minimize his sorrows, play a strong crescendo on the theme of his privileges and rewards and soft-pedal his misfortunes—unless he can do these things in a spirit of essential optimism, he might as well part company with his pupils and, like poor old Mr. Mell, fold up his

flute and steal out into the night. But any right-minded teacher will maximize his blessings, and a count of these will certainly be a long one.

In the first place, ours (and here, you see, I adopt the first person) is a consecrated profession. We are set apart for a great and a notable work. We should never for a moment forget this fact; its fundamental character is too obvious. We are priests before the altar-fires of childhood and youth, and it is ours to see that the incense burned is fragrant and that it is not offered up to Baal or Dagon. Some may object to the Levitical character of the figure; they can hardly object, however, to the fundamental truth of the imagery. I have long remembered and often repeated what a high school teacher said to me when I was a boy: "The profession of teaching is more important than the profession of preaching; the teacher *forms*, the preacher *reforms*. When the time shall have come that the teacher does his work as it should be done, the preacher will have left him little or nothing to do." I place first, therefore, among the amenities of our profession this sense of satisfaction that comes (or ought to come) from the realization of the importance of the work we have to do. There is no greater work, for it is work upon the foundations of human society. To vary the figure, we are preparing the soil, planting the seed, cultivating the growing plant. Without us there could be no harvest, no reaping and gathering into barns, no food for the nourishing of human society, no onward progress in the strength of that nourishment. Let every teacher, then—not in conceit, but in humility—remember the importance of his work, and take comfort therein.

Closely analogous to my first point is my second: we are active in a profession whose work is the most widely discussed of any in the world to-day. As I remarked earlier, whatever the contempt in which the pedagogue is held, there is a generally popular conception of the dignity and worth of education. This popular conception is fostered by the widest possible publicity given by press, forum, and pulpit. From these sources come discussions of education in its wider aspects; from our own multifarious journals, pamphlets, and papers come discussions of education in its narrower aspects—method, technic, procedure. It is generally felt, both in and out of the profession, that education is the largest single problem with which the world wrestles to-day; that it is the cure for all national ills and the panacea for world sickness. There is prevalent, too, the feeling that we are on the threshold of new discoveries in educational method; that there will burst a great and sudden light which will illumine the whole field; that there will be turned up the philosopher's stone, which shall transmute all educational endeavor into the gold of intellectualism. To live and to work in the midst of this universal glow is worth something; to

be active in a profession dealing with problems acknowledged so great is surely rich compensation in itself.

In the third place, it is given us, if we choose to embrace the opportunity, to contribute to that universal discussion which has made the problem of education the most talked of problem in the world. We are able to write papers for this or that learned (or quasi-learned) society; to compose diatribes to be read at clubs; to edit a book or deliver an address; to kick up a little dust in the world, and watch it settle on quite inoffensive and indifferent people, who are thus made aware of our existence; to exhibit our bit of *ego*, in other words, in such a way as to stir our pride, soothe our vanity, and heal our wounds. The President of the United States can really get no more out of his activities than we out of ours—and I fancy he works much harder than we to get what he gets in the way of egotistical satisfactions.

LET us progress, then, to my fourth of the schoolmaster's amenities: he works in an unusually congenial atmosphere. Boys and girls are good fun, after all, and a man's colleagues in most good schools are men and women of parts. The least attractive of us has something of social grace; the most stupid has something of intellectual interest. We are, moreover, at work as a unit on a common problem, and that a fascinating one. There is *esprit de corps* among us. We like one another, despite occasional bickerings; and we trust one another, despite occasional interdepartmental jealousies. Let us not underrate the value of this congenial atmosphere when we come to list our assets and liabilities as teachers.

We may regard, in the next place, our good fortune in being out of the uncongenial atmosphere of modern industrial life. The world is money-mad. It is filled with the inane strife and senseless racket of money-grubbing and money-grabbing. And money was never before so eagerly sought as an end in itself, not as a means to an end. The fortune is the thing, not the durable satisfactions of life which money may, when rightly spent, assist in buying. When I left my home in the Middle West eighteen years ago, I left a city of 20,000 people whose paramount characteristic was simple tastes and simple pleasures. When I go back now, I find a city of 70,000 people; a city grimy with factory smoke, reeking with gasoline fumes, a city aping metropolitan ways and seeking metropolitan pleasures. A few of the simple old friends remain; but many have grown rich, and with their riches have purchased the cheap pleasures which only the rich can buy. It is on the occasions of these visits that I am glad to be poor, glad to have preserved the old simple tastes, glad to be a teacher.

This, then, is my sixth of the amenities: the fact that we are compelled to

cultivate simple tastes and to find our pleasures in the simple but real satisfactions of life. We may be poor in this world's goods, but we are rich in the moral and spiritual benefits that necessarily accrue from that very poverty. We do not have to be constantly reminding ourselves that happiness is not a purchasable commodity, but comes from within, out of the rich fullness of heart and soul. That is a truism which we daily accept because of its personal demonstration in our lives. We are spared the classic plaint of poor old Bridget Elia. "I wish the good old times would come again," she said, "when we were not quite so rich. . . . A purchase is but a purchase now that you have money enough and to spare. Formerly it used to be a triumph. . . . A thing was worth buying then, when we felt the money that we paid for it. . . . There was pleasure in eating strawberries before they became quite common. . . . What treat can we have now?" As teachers, our treasures are of the heart, our pleasures are of the mind. We are rich indeed.

Akin to the last is another substantial benefit that is ours. We are constantly under the goad to live cleanly, constantly under strong moral pressure to be our best, for we are constantly under the fiercest scrutiny as examples for the young. "This makes for hypocrisy," you say. I can only enter my strong denial. This fact prompts the right kind of teacher not so much to cover his faults in hypocritical fashion as to strive to make his real self square with his outward bearing. Such an impulse, long continued, is bound to bear fruit in better impulses, nobler aspirations. Let us be grateful, as we summarize our blessings, that we are spared some of the moral pitfalls so prevalent in business and in many of the professions.

Another, perhaps one of the greatest, of our advantages is that we are conscious of intellectual growth in the very prosecution of our professional duties. Those of my friends who have any intellectual interests at all are constantly reminding me of my conspicuous advantage over them. I live in an atmosphere of books; but they, if they are to acquire any bookishness whatever, must snatch a moment here and a moment there as a pittance of time is allowed them from the treadmill of their daily occupation. Perhaps teachers are, as the critic quoted says, "diluters and retailers of the ideas of their superiors." But this should prove no very great stigma, after all. The infant takes his cow's milk diluted when he is weaned; and surely this same critic himself would not advocate feeding an adolescent on "Prejudices, First and Second Series." The point here is that, while we may constantly be stooping to inferior minds in our class-rooms, we are constantly too in the presence of our superiors, whose ideas we "dilute and retail." Ours is a profession which lives, through books, with the great minds of every age. We

do lead intellectual lives—or at least we may. I understand fully, therefore, the tone of envy that is heard from every one of my old business friends who comes to visit me: "If only I could live in an atmosphere such as surrounds you!"

Not only do we find intellectual growth in the pursuit of our profession but also do we find a large part of every year ours to do with as we please—to study, to travel, to grow. The poorest teacher in the world is rich in time. "The cost of a thing," says Thoreau, "is the amount of what I call life which is required to be exchanged for it, immediately or in the long run." And Robert Louis Stevenson adds: "The price we have to pay for money is paid in liberty." If liberty be the great human medium of exchange, the gold standard of human values, then are we rich indeed, for of liberty we have more than four full months every year—a third of every twelvemonth. How pitiful seems the "two weeks off" of the usual young man of business! How inadequate the month to which he treats himself when he has achieved some measure of independence! We are millionaires—in time. It is only a question as to how we squander our patrimony. But if we will, we can use it to purchase the best that life has to offer.

I HAVE come to my last point—and the most important. It is this: We are in our daily tasks at work with the most valuable of all materials set to men's hands for fashioning, and it is, of all materials, the most plastic. We may sometimes doubt the plastic character of our raw material, but it is clay to the potter's hand nevertheless. We do fashion lives. We do accomplish things with human souls. This is the prime privilege, the chief reward, in one. I have elsewhere said that "work with boys is at once the most inspiring and the most discouraging of labors. In no other profession do results come so slowly or seem so uncertain; in no other field of labor does fruitage seem so long deferred." But the fruitage does come and come in ways that are often past our comprehension. We curse day by day the sievelike memories of our pupils and as we continue to pour we wonder if anything is ever going to stick. But who can estimate how much remains or of what kind? I had the pertinence of this query borne in on me some weeks ago when a friend was telling me in simple and undramatic fashion of the recent death of his only daughter, a girl of eighteen. She knew she was to die that day, and just before dawn sent for each of the members of the family to say good-by. To her older brother nearly twice her age, she said: "You have been the best brother in the world. You never even scolded me when I turned over your type." Her allusion was not clear to those about the bedside until they remembered that when the girl was a child of three she had, in mere mischievousness, turned over a

full font of type which her brother had just been distributing. He patiently picked up the type and redistributed them, with no word of reproof to the child. Through all the fifteen years that had elapsed no mention of this incident had ever been made; it was nearly forgotten. But the girl of eighteen remembered it on her deathbed as one of the salient impressions of her whole life; and on that incident of her babyhood hung the sum total of her impressions of her brother.

The fruitage of our work, though many times long deferred, is real.

Definite satisfactions come to teachers who see their old pupils, perhaps many, perhaps few, but always some, taking a real part on the stage of the world's affairs. The teacher's name is not blazoned in electric bulbs as producer or manager before the theater of the pupil's achievements; but the teacher is conscious of being in the wings, somewhere behind the footlights. Something of the drama he prepared is being enacted there upon the stage, and he is satisfied not to be under the spotlight. He is content, with Milton, to remember that—

Fame is no plant that grows on mortal soil,
Nor in the glittering foil
Set off to the world, nor in broad
rumor lies,
But lives and spreads aloft by those
pure eyes
And perfect witness of all-judging
Jove;
As he pronounces lastly on each deed,
Of so much fame in heaven expect
thy meed.

The teacher, the true teacher, is willing to work and to wait. The teacher, the true teacher, knows the worth of what he is doing, and is content.

GLASS BOTTLES AND COMMON SENSE

BY SHERMAN ROGERS

INDUSTRIAL CORRESPONDENT OF THE OUTLOOK

THE rights of one citizen end where those of another begin." This statement was not made by a college professor, a community worker, a politician, not even by a judicially inclined lawyer, but it was made by James Maloney, Vice-President of the Glass Bottle Blowers' Association.

The labor leader was quoting a Frenchman, adding, however, that he believed it was the best definition of the rights and duties of organized labor members as men. That isn't all. This spirit prevails in general throughout the

glass bottle industry from both manufacturers and workers.

I delivered an address before the Pennsylvania State Industrial Association at Harrisburg recently, and just preceding my address John A. Voll, President of the Glass Bottle Blowers' Association of the United States and Canada, delivered a wonderful address that greatly impressed me. The meat of his address was a plea for co-operation between the employer and the employee, for a thorough understanding between those two parties and a settle-

ment of all serious disputes by voluntary arbitration. His speech was more or less of the "cross of service" variety. His plea for good wages was based on the declaration that labor was entitled to good wages, but was at the same time under obligation to do an honest full day's work. The labor leader was just as emphatic that the employer must do the square thing. He must play fair with both the worker and the public.

Half an hour later we were seated in the smoking compartment of a Pullman car bound from Harrisburg to Philadelphia. Mr. Voll looked me over and said:

"Mr. Rogers, I agree with a great deal of your speech. We have most of the fundamental principles you talked of in our organization. We have industrial representation. That is, each shop has its own committee to deal with the management. The business agent exists, but his power for autocratic practice is curbed. I will explain to you, a little later on, why and how. This shop committee, composed of workmen inside the factory, takes up all grievances arising with the management. If, however, they fail to agree after thrashing the matter out thoroughly, the International President of the union is called in. He settles about ninety per cent of the disputes that he is requested to adjudicate. If, however, the management and the President are unable to arrive at an agreement, the President temporarily makes a decision in the matter and the dispute is carried before the sessions of the Final Wage Conference. In other words, in the glass bottle industry, composed of nearly 10,000 workers and many manufacturers both large and small, we have an arbitration committee that has functioned for a great many years.

"This arbitration board is composed of about ten union leaders who are selected at the Glass Bottle Blowers Workers' annual Convention and the same number of manufacturers who are appointed by the Chairman of the National Bottle Manufacturers' Association.

Keystone

BOTTLE-MAKING.—THE BATCH IS DRAWN FROM THE FURNACE AS A WHITE-HOT LIQUID. AN OPERATOR DIPS IT OUT, PANNING THE THICK LIQUID FROM A METAL SCOOP, WHILE ANOTHER OPERATOR WITH A PAIR OF SCISSORS CUTS OFF A PROPER AMOUNT WHICH FALLS INTO THE MOLD. COMPRESSED AIR BLOWS THE BOTTLE INTO SHAPE

We have this annual arbitration conference to settle all disputes instead of resorting to strikes, and for the last twenty years we have not had one generally affecting the industry.

"The twenty members that meet at this general conference select a chairman. We have always, by unanimous approval, selected the Chairman of the Manufacturers' Association for that position. The decisions have always been fair. Many times when the conference would deadlock we have called on the Chairman to hand down a decision, and it has practically always been favorable to us. In fact, I think it always has been—but our industry is organized on a basis whereby there is no loose talk on either side. When we get to our general conference, every statement made is a statement of sincerity, and the party making the statement, whether he represents the employers or employees, finds out where he stands before he makes it. Several times delegates of both workers and manufacturers have made statements in the final wage conference that were not based on fact. They were quickly eliminated from the picture, and, as a result, we have no rash statements made by either side in our industry.

"Now I'll explain what I mean by the 'curbing' of the business agent. The shop committee, or direct representation between the committee of workmen and the manufacturer, does not eliminate the business agent as an official, but it does place him in a position where he cannot call men out; it also places him in a position where he cannot make a misstatement regarding the worker to the employer or the employer to the worker. His hand would be immediately 'called' if he did. It has not curbed him in his legitimate authority. Grievances between the men and management are adjudicated by the workmen's committee and the management, instead of the business agent being the sole arbiter between the men and the management. The workmen's committee, the business agent, and the management, naturally, have got to predicate their contentions on facts, because they know that, in event of a dispute, the case is reviewed by the final arbitration board, and if either side has made any misstatements they are going to be brought to light and the offending parties are not only censured but quickly lose their established position. Therefore we have had harmony in our industry because we have established a relationship that engenders both confidence and respect and compels conservative deliberation."

By this time I was doubly interested in the organization Mr. Voll represented. Here was a union and a manufacturers' association working on a basis where the prosperity of the industry was the first consideration and where the prosperity of both the worker and the company was not jeopardized by hasty, ill-considered, or ill-informed action by either side. Here was an arbitration

board set up for an entire industry which brought the possibility of a strike to a negligible minimum.

There was a very interesting story told about one of the recent conventions. Concessions had been asked by the manufacturers of the union.

The wage conference arbitration board had been in session for a week. Nothing had been accomplished. The leaders of both sides were on "feather edge." They were irascible and unconciliatory. Finally, on Saturday night, several of the delegates had their transportation engaged. A motion was made that the conference adjourn, which would mean that anything might happen in the interim. The manufacturers' organization might break up; open shop might be declared or disintegration of the workers' organization might take place. Yet, in the face of this, both sides in their distraught mental condition were unable to reach a compromise. A manufacturer proposed a resolution to adjourn. The resolution was seconded.

At this juncture another manufacturer arose and said:

"Gentlemen, my conscience would bother me a great deal if we were to adjourn this conference in this manner. We are not so far apart but what we can agree on a solution. Our nerves are all on edge. I propose that we adjourn the meeting for the day and meet again next Monday morning. That will give us all of to-night, to-morrow, and to-morrow night to think this matter over. We will meet Monday morning feeling different than we do now. I don't think we have a moral right to bring this conference to a close without coming to some agreement on the question involved."

His proposal was accepted. The meeting adjourned and the men left for their respective hotels. Monday morning, when the session was resumed, it took only a very few moments for the board to reach an amicable adjustment.

The most noteworthy feature of this permanent, annual arbitration conference is the fact that both sides speak their hearts out. They are cool, clear, and each side puts up a strong argument. They leave nothing unsaid, but the fact that they must tell the truth places a ban on unnecessary misunderstanding.

The relationship that has been established in the glass bottle industry means a great deal to me. It settles one of the contentions that have been brought to my attention rather forcibly during the last two years by union labor leaders. These leaders have pointed out that industrial representation should work just as successfully under union conditions as under conditions where men were not unionized. I have always agreed with them, but I could not find a place where they had it in operation—that is, where closed-shop conditions existed. I know of several labor organizations that practically work on an open-shop basis with committee representation and it is successful, but here

it works out in both an efficient and successful manner under closed-shop rules.

I have for several years bitterly opposed the czarlike authority vested by many local unions in the business agent or "walking delegate." He has been able to keep the employer and employee from understanding each other. Providing that he was mentally dishonest, it was very easy for him to make a lot of rash, untruthful statements to the workmen, because they would have no way of learning the truth. But in the case of the glass bottle industry the contact established between the office and the shop prevents the business agent from making false statements to the men about the employer and *vice versa*.

If the American Federation of Labor would apply this same system all over the country, about nine-tenths of public prejudice would be immediately eliminated. If they had industrial representation as the basic principle of adjudicating shop troubles, with an arbitration board to settle cases that the management and men could not settle, the workers would at once gain the confidence and sympathy of the public, and there is no employer big enough to ignore, at the present time, an adverse public sentiment.

The remarkable part of the glass bottle workers' arbitration conference is in the fact that the minutes of the meetings, are published by the union and distributed broadcast among their membership. This gives every worker in the industry a chance to realize the difficulties confronting the employers; knowing this, they base their wage agreements and working conditions on facts instead of some agitator's imagination. In other words, the glass bottle workers have a thorough knowledge of the industry, and therefore have no illusions about criminal profits on the part of the employer. A wonderful result is only natural. There is no body of workmen in America where the efficiency is greater than in the glass bottle industry. Men work because they know why they must work. They know the amount of work they must do to give themselves a decent wage.

The glass bottle worker has three protections: First, he is immune from I. W. W. doctrines—he knows better because he knows the truth. Second, he has confidence in his wage schedules because he understands the conditions existing throughout the industry that he is engaged in. Third, he is satisfied because he knows that his employer cannot take advantage of him, even if he wants to. In other words, he knows he can get justice without striking for it; therefore he is not thinking about a strike.

The glass bottle manufacturers and workers have made a great step in the direction of peace and progress in industry. They recognize the most important factor in industrial relations by realizing that "the rights of one citizen end where those of another begin."

A GREAT SCENIC HIGHWAY

PHOTOGRAPHS BY HENRY HOYT MOORE

The new Storm King Highway will be part of the State road running along the west shore of the Hudson River from New York City to Albany. The section of the highway here illustrated runs from West Point to Cornwall, through the finest part of the Highlands of the Hudson. The above photograph shows the road as it runs along the precipitous side of Storm King Mountain. A noble view of Newburgh Bay lies behind the observer standing at this point. The highway has been under construction for several years; it is a triumph of engineering skill, and will take its place with the Corniche Road, the Amalfi Drive, the road in the Crimea along the Black Sea near Yalta, the Columbia River Highway, and other splendid scenic roads of the world. The highway, it is planned, will be open to the public this summer, in July or August.

AIR FORCES AND BRITISH EMPIRE DEFENSE

BY MAJOR-GENERAL SIR GEORGE ASTON, K.C.B.

CERTAIN facts disclosed in recent House of Commons debates should be of interest not only in the United Kingdom but elsewhere. In 1918, when the Great War came to an end, Britain possessed about 22,000 aircraft, compared with France with 20,000 and Germany with 18,000. Some idea of the wastage of machines and the tremendous output for replacement and reinforcement may be gathered from the figures given a short time ago by Brigadier-General Groves in the London "Times." Between January and October, 1918, the figures for the Royal Air Force show an output of 26,685 machines and 29,561 engines. Captain Guest's figures for the Air Force showed that we were lately keeping up 31½ squadrons, of which 6 were in India, 8 in Irak (Mesopotamia), 3 in Egypt, 1 in Palestine, 1½ in the Mediterranean co-operating with the navy, and only 12 in the United Kingdom. There are 12 machines in a British squadron. France, we were told, maintains an air force for home defense of about 62 squadrons, and a French squadron includes 8 airplanes for fighting and 12 for bombing. Germany is developing commercial flying on a large scale and establishing a number of new air routes. Captain Guest claimed in his speech on the estimates that 200 miles an hour is a normal speed for airplanes and 560 miles continuous flight an ordinary performance. That gives a radius of action of under 300 miles, so the disturbing statistics for European developments are of more direct interest to the people of Great Britain than to those in other parts of the Empire. The people of Great Britain showed their confidence in the future by cutting down the air estimates by £7,500,000, and the number of air officers and men originally proposed for 1922-3 by 9,700.

At present no one in the United Kingdom is taking much interest in the "next war," or, at all events, most people are content to accept the assumption that it will not come for at least ten years, so that under present conditions it is better to balance the Budget, improve our credit, reduce taxation, and so develop industries and reduce the number of unemployed. It is thought to be better to face uncertain risks of European war than the certainty of bankruptcy involved in spending enough upon armaments to secure us from air attack by our neighbors, besides keeping up a one-Power standard in capital ships and a strong enough army to police the Empire and defend its land frontiers. As matters stand at present, if we assume the existence of an enemy in Europe within petrol range of airplanes—say 300 miles to-day, which may be indefinitely increased during the above-mentioned ten years—and if we

assume the possession by such a prospective enemy of sufficient resources to conduct air attacks on a large scale upon the United Kingdom, then we are not in a position to meet the menace. Let me hasten to add that I do not believe that any such prospective enemy at present exists.

After careful investigation of expert opinion, we are driven to the conclusion that any great industrial nation acting upon the principles of Clausewitz and the German War Book would be able

THE BLACK HEARTHSTONE

"If you go to the movies, or if you read stories in magazines that have a few million a week circulation, or if you see him on the minstrel stage, you will get nothing but a pitiful caricature of the Negro. Inevitably he will be shown to be cowardly, absurd, pilfering, scheming, credulous, preposterous. If the characterizations were true, they might be ludicrous; but nearly all of them are shamelessly false. Long have I been amazed that the American public could be for so great a length of time so deeply deluded. Of course it depends on what the public wants: the truth or merely something to create laughter, a portrait or a cartoon—and even the cartoon lacking that crude sapience of justice that a good cartoon has; the mirror held up to nature or merely buffoonery and burlesque. If you would hear the oracle, go to the shrine; if you would know the present truth, and through it come to a clear understanding of it, and therefore to a sane vision of the future, visit the black hearthstone."

Archibald Rutledge, a Southerner by birth and training, carries the reader to this "black hearthstone" in a forthcoming Outlook article. It is as vivid and distinctive a piece of writing as Mr. Rutledge's other essays on Southern life which have previously appeared in these columns.

within a few hours of the order being given to devastate whole cities with poison gas and explosives in any foreign country within the radius of action of aircraft. There would be no adequate "defense" against such danger. Anti-aircraft guns could not give sufficient protection, and defending aircraft could not always be in the air at the right place. The only deterrent would be the prospect of reprisals.

One of the other principles of Empire defense accepted by the representatives of the British Empire in 1907 was that of individual responsibility for local de-

fense. We are not at present making provision in the United Kingdom for local defense against the gruesome form of warfare which air enthusiasts tell us will be adopted in the "next war." It is only fair that that point should be made clear to all peoples having the good fortune to be out of range of such European communities as may not yet be heartily sick of the bestial horror of modern scientific warfare.

So much for the air-defense problem, which experts tell us is now confronting the population of the United Kingdom. Another of the axioms of British Empire defense is that by sea power the food supply of that population must be secured. Food would be of little use to people poisoned or bombed. Let us hope that our European neighbors have not forgotten the ultimate issue of a war conducted on similar principles by the Germans in 1914-18. In that hope we are contemplating air attacks upon the United Kingdom in the immediate future with equanimity. The controversy, started by Sir Percy Scott, in the "Times," on the influence of air forces upon the problem of sea power is of greater direct interest to other parts of the Empire. It arose over the proposal to begin in 1922-3 the construction of two British capital ships of about 35,000 tons each in order to maintain a one-Power standard, and to keep up to the 5-5-3 proportion in capital ships between ourselves, the United States, and Japan, as agreed upon at Washington. We read of airplanes capable of dropping 3,000-pound, 4,000-pound, and even 5,000-pound delay-action bombs capable of sinking big ships if dropped by airplanes in their vicinity. We also read of experiments by squadrons of torpedo-dropping airplanes attacking ships from behind smoke screens emitted by buoys dropped by other airplanes. We read of fast vessels capable of carrying such airplanes and taking them all over the world for use against war-vessels, merchant shipping, and industrial towns on the coast. There are no limits to the horrors predicted for the "next war," but, to my mind, a fatal mistake is being made in assuming that, owing to air developments, such a war would be quickly decided. A similar error about armies did much towards bringing about the great catastrophe of 1914. With this mistake is being revived the "great illusion" that war in these days of economic interdependence of nations can bring profit either to victors or vanquished. Let us hope that the air enthusiasts will never in any country be given as free a hand in the initiation or conduct of war as the German militarists were given in 1914. We have had enough of that sort of thing to last us for a generation.

ORDER OR DISORDER

BY GUGLIELMO FERRERO

THE question confronting us all to-day is this: "Does order or disorder prevail in the world we live in?" Not such an easy question to answer if we are willing to consider arguments and facts. "The world is crumbling about us," cry those born to despair, while our smiling optimists reply that the world is jogging along as well as ever it did.

Nevertheless we have seen too many old régimes, that we had come to look upon as century-seasoned oaks, blown down like rotten tree-trunks by a sudden wind.

The decade from 1908 to 1918 is the biggest graveyard that history has yet had to provide for deceased republics and monarchies. It is a Potters' Field where Asia, Europe, and America, Christians and Mussulmans, the white and yellow races, have thrown *pêle-mêle* the corpses of their governments, dead of a sudden revolution.

The Turks inaugurated the burial-ground by throwing into it the absolutism of the Caliphate. Mexico provided the next funeral cortège, burying an ancient, Roman-style dictatorship that had grown old with him in whose person it lived. China then hastened to bring up her dead Manchu dynasty, that had breathed its last at the proclamation of the Yellow Republic.

At the first unexpected shot of the Turkish and Chinese revolutions a quiver of hope penetrated Europe's deepest fibers, and America's. The dawn-light of liberty and democracy was penetrating now even to the most distant horizons, and everywhere even the most obstinate shadows of despotism were fleeing. But the illusion did not last long. The old régime had no longer the strength to govern; the new régime was not yet strong enough. In Turkey, in Mexico, in China, it tried to move itself along by sudden starts and jerks—*coups d'état*, martial law, dictatorships hostile to one another. Three immense states, no longer wishing nor able to govern themselves according to their old code, fell into the ghastly sickness of chronic civil war.

But the Potters' Field was not yet full. . . . The Great War began. One after the other the corpses of the Russian, Austro-Hungarian, and German Empires were thrown into the common grave.

Even the most ancient and illustrious dynasty in Europe, which for three centuries had worn the crown of Diocletian or Constantine, was to disappear. The red flag that Lamartine had refused to hoist on the Hôtel de Ville in 1848 now rippled in the breeze at Potsdam and Schoenbrunn. And again for a moment America and Europe saw the promise of marvelous new epochs, and the dawn of unknown happiness lighting a world

freed now from the tyrannies of the past. At a stroke the great dream of 1848 seemed reality; Poland restored, republics at Moscow, Berlin, and Vienna, kings deposed, nations called to govern themselves, and universal suffrage crowned at last as sovereign of a liberated Europe!

But this illusion too was short-lived. In Russia and in Hungary the democratic revolution, after taking a few lurching steps, suddenly stumbled and fell. In a few months universal suffrage gave way to military dictatorship, whose sole title to the right to govern is force; and force is, of all the elements of governmental authority, the most uncertain, the most capricious, the most subject to change, and, when all is said and done, the weakest. In the other states which have sprung up on the ruins of the Hapsburg and Hohenzollern Empires the will of the people, expressed through the vote, still rules. But, called upon overnight to put on the crown and grasp the scepter, the people's will is weak, uncertain, vacillating. It hesitates, perplexed before its tremendous responsibility; it does not command, it stammers; and with great difficulty it now and then recognizes itself. But in all new states it is torn by discords, at war with itself partly because of old party hatreds inherited from deceased régimes, partly because of inveterate class rivalries and conflicting interests, partly through religious differences and diversities of language and race.

All must needs be uncertain in these new governments—their title to authority, the forces they are able to control, the real will that animates and impels them. Their whisperings, their ambiguous acts, make it impossible for others to understand what is perhaps unintelligible to themselves. No one knows where they came from, where they are going, how long they will last, what they want, nor what they can do; no one knows what obligations to assume towards them, nor in what degree to fulfill them. Their nature is uncertainty, and their uncertainty affects and weakens the few governments that are still sound. With nations as with individuals, it is hard to think, to will, and to act resolutely towards those who do not know what they want nor even what they are.

And it may well be that even to-day the Potters' Field is not full, and is still waiting for other corpses. The explosion in Europe was felt even in Asia. The oldest buildings there already show cracks. England's statesmen had dreamed a dream. Their dream had told them that, though the Russian Empire fell, England would without stirring from her island home remain

mistress of Asia, that she would take possession of it by simply lifting a finger. The British statesmen were wrong. The Russian Empire is dragging England along with it to the abyss. Just as long as the Russian Colossus continued to be in its far northern haunt the terror of Asia, England had supporters, friends, political groups eager for her aid and protection in Turkey, Persia, and India. Of two evils one always chooses the lesser. Now that Russia no longer inspires fear, Asia is in revolt even against England. When the greater evil is removed, then the lesser becomes intolerable. England is tottering in India, has not been able to maintain herself in Persia, will not rule long in either Mesopotamia or Constantinople, for the very reason that her powerful rival is no longer there to dispute her prey.

Just as European domination is tottering in Egypt, so it is tottering in Asia. For a double impossibility arose in the Oriental world from the mingling of its ancient traditions with the teachings and customs of the Occident; the impossibility, on the one hand, of continuing to live with its own institutions, and, on the other, that of adopting the institutions of the Western world. Asia's insomnia comes from this double impossibility. The political pharmacopœia of the Occident will seek in vain for a narcotic to put it to sleep again.

Nations whose bones are still healthy and hard are few. For, like its governments, institutions, and principles, the whole world is suffering from a softening of the bony structure, which for the most part is degenerating to pulp.

A government is nothing more nor less than a reply to the question, "Who has the right to control and to what degree? Whose is it to obey and within what limits?" On the answer to this question our solution to all the other questions of life depends.

Every now and then some portion of mankind succeeds in convincing itself that it has solved this problem to perfection; but the ages never grow weary of propounding it again and of trying some new solution.

Yet to-day an unwonted and very curious state of affairs has come about. The entire human race seems to feel dissatisfaction with all the solutions that it has found, no matter where nor in what century. No one of them satisfies, because no one of them seems just, nor honest, nor free from insidious deceptions. Mankind no longer puts its trust in any of them; and that is why it cannot sleep, why it has lost confidence in itself, that is why it hates the present and despairs of the future.

And in truth those of us who cry out

that the world is falling to pieces are not entirely mad; we are, as a matter of fact, living in the midst of general and complete disorder; and yet—

And yet every morning our old servant, who but a century ago became our master and our god, our erstwhile slave, Fire, wakes up and summons us all to our tasks. The furnaces are lit, the chimneys smoke, wheels and belts, interlaced, revolve. The farm-hand returns to the field, the workman to the shop, the clerk to the store, the banker to his office. They do not all go to their work as willingly as they did ten years ago; but they do go to work, even though they grumble.

And every day and all day, in Europe as in America, our gigantic production machine goes round ceaselessly and indefatigably, maintaining in the world a kind of order, in place of ancient authorities now shaken or fallen away. Fire and the machines into which it breathes life are our tyrannous masters, obliging us to produce and consume even after our needs are satisfied and our exhausted nerves need rest. The labor of the men of our times is a kind of dull slavery. But, by way of compensation, the slave is no longer alone. He works in herds now, not solitary, as in ancient times. For present-day labor has its chain gangs, links classes and professions together, unites city with country, and binds citizens and states, provinces, peoples, and continents to one another. And so long as this chain does not break, a certain amount of order will prevail in the world, even though all civil and criminal law should be thrown to the dogs, even though philosophy and literature should go mad, even though no government should be able any longer to command obedience, even though civilizations grown too old should fall into dotage.

Fire has to-day become the guardian of law and order in place of King-by-the-grace-of-God, now deposed. The revolutions and wars of the twentieth century have overturned many sanctions and many states that believed themselves immortal. But merely breaking a few wheels and levers does not suffice to destroy the powerful production machine constructed by the twentieth century. For those peoples and nations whose bones are soft, work is a kind of corselet and prop, an external bony structure to support the flesh of those unfortunates whose framework has turned to pulp.

True as it is that the order of the world is disintegrating, it is also true that order still prevails to an almost miraculous degree. One has but to think of the number and venerable age of the governments and princes that within the last fifteen years have crashed to their doom. The world has found a new principle of order; it is the discipline of work, imposed by fire and the mechanisms fire moves. Hence the question confronting us, For how long and to what degree will this new prin-

ciple play the part of those it has superseded?

Only the future will be able to answer. But whoever, without prejudice or passion, studies the events developing before our eyes will discern two fatal errors which it is possible for the peoples of the earth to commit, but which it is also possible for them to avoid.

The first is that which the Russians are now expiating with hunger and death. In a few weeks the Russians overturned the columns of the old régime; the monarchy, the Church, the bureaucracy, the army. The dynasty removed, the administration decapitated, the Church abandoned to its own tender mercies, the army dissolved or nearly so, there remained of the old order nothing but the great production machine, agriculture, industries, banks, and railways; in other words, property stood alone and naked, no longer protected by the Imperial Guards, by authority, by the Church, by the State and its thou-

sands of bayonets. The temptation to finish the job was irresistible. "Down with property too! What did we have our revolution for if not to destroy property?" Thousands of throats took up the cry, thousands of frantic fools.

The tragedy of that Russian Revolution which began in March and lasted to November, 1918, and which the world does not yet understand, began with that cry. The masses, deaf to reason, wanted the goods of the rich. But the Revolution, having dethroned God and the Czar, still hesitated, as though property were more sacred to it than the cross or the scepter. In that moment of hesitation it showed itself supremely and unconsciously wise. For, having swept away all the other authorities which had for so long maintained order in the Empire, the supreme exigency of the situation was *not to touch* the production machine, to which now fell the task, not only of feeding, but also of binding together the whole social structure.

During six months the Revolution hesitated, paralyzed by its instinctive wisdom. But wisdom was its ruin when Folly arrived, for Folly had read somewhere in a German book that no part of the defective world is so fatally defective as its production mechanism, which creates riches at the cost of pain and distributes them unjustly. She had read also that in order to recreate the world this monstrous creature must be destroyed; and, finding it alone one day, no longer well guarded by either spiritual or temporal authority, Folly made quick work of it.

And in the conditions that resulted complete disintegration of the social fabric took place; for men could no longer work. They were deprived of even this restraint and discipline. There no longer remained any principles of order or cohesion. The destroyers tried in vain to improvise a crude military dictatorship with the remnants of the army and police system of the old order. In three years more ruins accumulated in the Russian Empire than three centuries would have brought about in times of less rapid decay. Cities abandoned, roads destroyed, fields devastated, arts and industries exhausted, thousands of men wiped out by pestilence and poverty. And then Famine began.

I say "began" advisedly. For all that is at present laying waste the Russian Empire is merely the precursor of devastation. There is no charity whose purse and heart will suffice, no matter how big they may be, to check the disintegration of a whole society. A part of the Russian people will perish.

The second error is that which the Germans seem bent on committing. It is the opposite of the first. It is the belief that the discipline of work can alone uphold the social order, even when the state is falling into ruins.

In Germany, too, Socialist doctrines have taken up a position within the

THE SPRINTER—A BRONZE BY DR. R. TAIT MCKENZIE

DR. R. TAIT MCKENZIE, sculptor, physician, and Director of Physical Training at the University of Pennsylvania, contributes an article to next week's issue of *The Outlook* on "Variations of Athletic Types." Dr. McKenzie strongly supports Mr. C. K. Taylor's recent plea for a new basis of judging physical development and growth. The article will be profusely illustrated.

In subsequent issues Mr. C. K. Taylor, whose discussions of physical standards in these pages have aroused Nation-wide interest, will contribute two articles of great constructive value to all those concerned with the development of a better boyhood and girlhood. One article deals with height-weight standards for girls; the other is a pioneer classification of children according to behavioristic standards.

state. But they have not followed the example of the Russian Revolution. Rather, one might say that, disarmed, isolated, despoiled of her colonies, as she is, Germany has identified herself with that gigantic production machine that she has been perfecting these last twenty-five years to the envy and admiration of the world. Germany has gone back to work, and with redoubled fury. Her ships are the only ones in the world not rotting idle in port, her furnaces are the only ones going at full blast. Her workers are the only ones in the world who are working more than a third of the work day; and withal they are receiving, with due deduction for the falling off of the currency, lower wages than before the war.

And this people, which ten years ago was ruled by a Government superlatively strong in authority, force of arms, and that resoluteness that comes from the knowledge that one is respected and feared, not only has no government today, but has not even the chance of having one. Germany no longer wants the old régime. But neither does she like nor understand the new. The former is hateful to her because it recalls a frightful catastrophe. For the latter she feels indifference when she does not feel repugnance. Her Republic is nothing but an expedient due to increasing

desperation; and she knows that the tyranny of circumstances will force this unwelcome expedient upon her for a long time to come.

Brought to birth outside the limits of tradition, the daughter of misfortune, possessing neither authority nor prestige, ruled by nonentities, served unwillingly by the bureaucracy, a slave of the past, the German Republic is nothing more than the instrument which is to bring about the final colossal downfall of the public fortunes. It cannot last. Every day it goes deeper into debt, and every day it falsifies a little more the economic values that it possesses. The people wait, resigned, indifferent, as if this frantic destruction were some one else's business, and as though the ruin of the state in no way affected the happiness of its citizens!

It appears, then, that in addition to the Russian catastrophe another surprise is being prepared in Germany. The Russian Revolution committed suicide by destroying, in addition to the state authority, the machinery of production; Germany may commit suicide more slowly by going to the opposite extreme, letting the state fall to ruins by working without ceasing. Fire is a powerful god, but it cannot govern the world alone. It cannot check all the

passions hostile to order. A nation cannot long maintain itself by means of external props; it needs sound bone tissue, firm, and elastic withal.

Whether we wish it or not, we shall have once more to answer the eternal question, "Who is to govern, and within what limits? Who is to obey, and to what extent?" The world needs an authority in which it can believe, it needs governments that will govern. This is the need of every race and nation; of Mohammedans and Christians, of whites and blacks, the need of Europe as of America. In this sense the order of the world is profoundly shaken, because this time it is not merely a group of nations and a part of the world that is affected, but the whole world is condemned to begin again the never-ending work of Sisyphus, which is nothing more nor less than the creation of spiritual principles of authority.

The framework of economic relations still supports Western civilization; that is to say, the greater part of Europe and America. But it is useless to pretend that it can support it a long time and alone. We, in our own times, are to learn that it is easier to create great riches than to find a principle of authority capable of imposing reason and justice on passions and interests perpetually at war.

WASHINGTON AT WAR OVER CIVIL SERVICE

SPECIAL CORRESPONDENCE FROM WASHINGTON

BY NEWTON FUESSLE

IMAGINE yourself a newly appointed Assistant Secretary of War, the Navy, Commerce, Agriculture, or any of the big Federal departments.

You are pleased with your impressive desk, your spacious office, the portraits of statesmen on your walls, and with the official dignity of your position. You take a deep breath and get to work, eager to make an efficient and distinguished record.

You buzz for your secretary, and after a while she strolls leisurely in and starts taking dictation. Your day is crowded with callers, but at about 4 p.m. they cease arriving, and you re-collect your thoughts, draft some more plans, and again summon your secretary. Nobody answers. You glance at your watch. It is 4:31 p.m. You cross to the broad windows, and see floods of employees issuing from the various buildings, all kinds of clerks and attachés, ranging from sprightly flappers to lame and grizzled warriors who were old-timers on the job even when Cleveland was in the White House.

You stalk out of your office in search of some one who can take dictation, but your search is futile. No one with an inkling of shorthand has lingered. Your first contact with the Federal Civil Ser-

WILLIAM D. RITER, ASSISTANT ATTORNEY-GENERAL, A LEADER IN THE ATTACK

vice has left you a little bewildered. It isn't the sort of thing you have been accustomed to in your business. You clean up your work single-handed as

best you can and finally leave your desk, disappointed and chagrined.

Next morning you get an early start, determined to make things hum. You look forward with relish to a heavy programme for the rest of the week. But that afternoon your secretary, who knows all the ropes of the department, strolls in and casually remarks:

"I sha'n't be in to-morrow or the next day. I'm going to Baltimore to visit friends."

You look at her in a dumfounded sort of way. She hasn't inquired whether it will suit your convenience to have her be absent on these next two particular days. She has stated her intention with such assurance and finality that you are at a loss for a moment for a reply. And during that moment she sweeps grandly out of your presence.

As the weeks go by you begin to grow more accustomed to the arrogance and indifference of your clerks. With a sinking sensation, you begin to realize that there is something wrong with the operation of Civil Service, and that because of its red tape you cannot possibly execute the amount of work you hoped to accomplish in Washington.

In conversation with some of your colleagues, you find that you are not

International

"QUITTING WORK ON THE DOT" AT VETERANS' OFFICE, WAR RISK BUREAU

alone in your suspicion that Civil Service, operating under its present rules, is not what it has been cracked up to be. You are shocked at the short hours and criminal waste of time. You cannot imagine private business being conducted under such a system.

THE PRESIDENT'S "RAID"

Behind President Harding's recent "raid" on the Bureau of Engraving there is a powerful undercurrent of official resentment against the Federal system of Civil Service.

While but few openly favor the spoils system as against Government employment subject to control by Federal laws, official Washington, however, is largely impatient and disgusted with, and up in arms against, the accumulation of defects in the present Civil Service regulations.

It is among the officials who were swept into office with the new Administration that the present protest has originated. Many of these officials, coming from private business and professional careers into Governmental responsibility, confess that they find themselves bewildered, baffled, and fairly hamstrung by the insolence and indifference of Civil Service employees, who consider that their jobs are life jobs and most of whom go about their duties with lazy inefficiency.

Assistant Attorney-General William D. Riter is one of the leading insurgents against the defects of the system. He hails from the Rocky Mountains and is a fighter. Another energetic assailant of the system's defects is former Governor William Spry, of Utah, now Commissioner of the General Land Office. These officials, who are apparently the spokesmen for a large number of their colleagues who have been staggered by their first year of contact with Civil

Service employees, contend that the system is full of inefficiency and waste.

It is charged that the Civil Service employees in Washington constitute the most powerful and autocratic labor union in the world. They have used their numerical strength to wring one concession after another out of Congress. It seems that clerks working for private enterprises do not know what they are missing. If they are intent on knocking out a reasonably good living with the minimum of effort, they would do better to resign their jobs, pack their bags, and take the first train to Washington.

Since the law provides that no Federal Civil Service employee shall be dismissed unless formal charges have been preferred and submitted to the employee, there has been speculation as to whether President Harding's action in removing from office numerous people in the Bureau of Engraving was entirely legal. But the President actually discharged no one. What he did was to abolish a number of offices. For example, he abolished the office of chief of the Bureau, and then created the office of superintendent of the Bureau. With the previous offices no longer existing, their incumbents automatically no longer had jobs. McKinley is said to have employed the same device. It is a "trick" frequently resorted to by States. At times the change in nomenclature is so trivial as from "the department" to "a department."

"A HINDRANCE TO THE GOVERNMENT"

Attorney-General Daugherty appeared last March before the House Committee on Appropriations, and expressed the opinion that the present operation of Civil Service offers "an interference in the discharge of public business" and a "hindrance to the Government." He

declared that clerks under the present system "are not as anxious, generally, to be in place to commence work on the dot as they are to quit work on the dot."

"I believe if it were not for the Civil Service," he said, "we could get along with less than two-thirds of the number of employees under Civil Service and probably get twice as much work out of them. I discovered, both before I came here as Attorney-General and since, that Civil Service employees spend too much time in trying to work out plans to make themselves secure in their positions."

Referring to a pending piece of litigation, Mr. Daugherty said: "The attorneys that the Government attorneys are expected to meet in preparation, in negotiation, and in court are the best men, the ablest men, that the bar affords. We are compelled to send, in a case involving millions of dollars, one man, two men, sometimes three men, to whom the Government pays \$2,500, possibly \$7,500 a year. They are meeting two men, three men, five men, ten men, sitting across the trial table, the best men in the country, whose earning capacity is ten times as much as the Government pays. They do well. I want to compliment the men who are in the Department of Justice now for the splendid work they are doing; but they are not under the Civil Service; they work night and day. I was myself at the Department yesterday (Sunday) a good portion of the day and all evening, and there were many men in the Department at work. They were not under the Civil Service."

The Federal Employees' Union promptly passed resolutions condemning the Attorney-General for his remarks and branded them as unwarranted and unfair.

In 1898 Congress passed a law giving

Civil Service clerks thirty days' vacation each year. The Attorney-General having given the opinion that Sundays and holidays must be counted, Congress was at once importuned to pass legislation nullifying this interpretation. Unable to withstand the pressure, that body passed a statute the following year to the effect that Sundays and holidays must be excluded; in other words, that a thirty-day vacation period means an aggregate of thirty working days. By an Executive Order issued in 1914, the working hours on Saturdays are limited to four hours during the three summer months; and in calculating the vacation period, the Government employee is charged on those days with merely four hours. By these means the net vacation period in each year runs close to one and one-half months—which no business institution in the country would tolerate.

Thirty days of sick leave are also permitted under the law. To take advantage of such sick leave one must present a doctor's certificate; but it appears that these are not very difficult to obtain. A clerk with a disposition to shirk can easily manage to be absent from his desk for nine weeks during the year, with pay. A department's forces have to be doubled during the vacation period if any semblance of work is to be maintained.

In striking contrast to the favoritism shown the Civil Service employee, attention is directed to the Congressional legislation enacted at substantially the same time dealing with employees at the Government navy yards, gun factories, naval stations, and arsenals. These employees are allowed an annual leave of absence of but fifteen working days. Absence on account of sickness is deducted, and not added, as in the former case.

"To add to the iniquity," said Mr. Riter to me, "Congress passed a law providing that Civil Service clerks shall work not less than seven hours per day, with a proviso—artfully inserted to disguise the meaning of the words just mentioned—that executive heads may, by special order in which the reasons shall be stated, extend these hours. The practical effect and meaning of this legislation is that Civil Service employees must not work in excess of seven hours a day. Laborers and mechanics on any Government project, whose work is just as hard and for the most part equally as concentrated, are, however, required to work eight hours a day. No other body of employees in the whole country are treated with such tender but ridiculous solicitude. I am strongly opposed to the abolition of the Civil Service system, but something must be done to improve its efficiency."

HOW A FORMER UTAH GOVERNOR MANAGES THE PROBLEM

Commissioner Spry, of the General Land Office, is a short, stocky executive with a military bearing, a genial eye,

and a gentle voice. He used to be United States Marshal of Utah, and was Governor of his State from 1909 to 1917. His extensive executive experience enables him to cope effectively with Civil Service red tape. The Commissioner has reorganized what was once a rigid and unwieldy staff into a flexible and competent organization. He keeps a continuous record of the work and efficiency of each employee, and from time to time readjusts their salary ratings accordingly. He says he does not tolerate "trouble-making, gossip, chatter, or loafing."

"Civil Service red tape robs young men of initiative," he told me. "The clerk says to himself: 'I am good until I am seventy, and then I get a pension. My future is assured, and I have nothing to worry about.' He gets into a rut and he stays there."

"A Government clerk is retired at the age of seventy unless the chief of the department requests that he stay. It is often difficult for a department head to resist the appeals of elderly clerks who want to remain at work. As a result there are numerous seventy-year-old clerks in Federal Civil Service doing long-hand work that might be done much faster and better on typewriters."

"Judicious executives sometimes persuade aged and disabled employees to take a demotion and the smaller pay that goes with it, in order to remain at work and to be paid more nearly what they are able to earn."

"I have discovered no examples of brain fag among Government clerks," continues Commissioner Spry. "Advantage is constantly being taken of the Government's leniency, and the present Civil Service laws and rules do not insure a reasonable return of effort for money paid out."

CLOGGED WITH DEAD-WOOD

"The trouble with the Civil Service is that it has been accumulating dead-wood for twenty-five years," declares another official. "Government departments are training schools, and the best men graduate into the business or college world. In the long run this clogs the bureaus and departments with the less successful, less aggressive, less able men, who can't be removed except for what is tantamount to criminal offenses. The offense of inefficiency simply can't be reached at all."

"The Civil Service doesn't go into the character and experience of the men it carries on its rolls. Recently, in connection with several appointments, the men who took the Civil Service examinations and passed were practically without exception men who came to Washington and 'crammed' with professional tutors exactly as college men often do. The work they were to be in charge of is such that it requires something like the experience of a ship captain to fit one for, and it offers temptations to graft which only men of character should be subjected to. The records showed

nothing as to these two all-important matters."

"The case of the Bureau of Engraving is simply another example of the last straw breaking the camel's back. I could cite other examples where the camel is still limping along loaded with straw, his vertebrae parting gradually and the cord showing, but no break yet."

"Now why can't the officers be given the power of discharge and still protect the Civil Service by being required to draw replacements from its rolls? I think the editorial policy of all forward-looking papers and magazines should be based on defense of the Civil Service, but that does not preclude, I think, championship of the right of Government officers of Cabinet rank to shift the personnel of their teams and to get new blood into their teams where the old blood is anemic—as it certainly is in most of the bureaus to-day."

"INFINITELY SUPERIOR TO SPOILS SYSTEM"

Possibly it is their own fault that some of the opponents of the system haven't found out how to make reasonably competent use of the equipment at their disposal, but it looks to me as if it takes the ex-Governor of a virile Western State to govern a Civil Service crowd and to throw a lariat round the neck of the system and make it perform.

Defenders of the present system claim that it is infinitely superior to the spoils system, and contend that if an executive is resourceful he can always get the desired results.

"Railroad clerks and clerks in corporations generally," argues one Government official, "get just as rusty as Government clerks. It is the size and tonnage of Civil Service that makes it so rigid, unwieldy, and difficult to handle except under stiff and formal rulings. But even if it is true that Government clerks do not measure up to the efficiency of clerks in private enterprises, this deficiency is largely compensated for by the lower pay of Government clerks, which runs from \$900 to \$1,600 a year. On Armistice Day there were 917,000 employees in the Federal Civil Service. On July 31, 1921, that number had been cut down to 597,000, and on December 31, 1921, it had been further reduced to 568,000. So, you see, it is always possible to get rid of Civil Service employees when the work is not there."

Another official expressed surprise that Civil Service was under fire, and declared that the only objection to it was the system of rating and classification.

Some of the critics of the present system urge the inauguration of periodic examinations to determine whether employees should be retained or dismissed. Others believe that a system of bonuses for specially good work might help break up clerical indifference. But the present resentful protest of officials who find themselves at the mercy of the system is almost sure to result in important changes and improvements.

Washington, D. C., May 29, 1922.

POEMS BY ELINOR WYLIE

NOW THAT YOUR EYES ARE SHUT . . .

Now that your eyes are shut
Not even a dusty butterfly may brush them;
My flickering knife has cut
Life from sonorous lion throats to hush them.

If pigeons croon too loud
Or lambs bleat proudly, they must come to slaughter,
And I command each cloud
To be precise in spilling silent water.

Let light forbear those lids;
I have forbidden the feathery ash to smutch them;
The spider thread that thrids
The gray-plumed grass has not my leave to touch them.

My casual ghost may slip,
Issuing tiptoe, from the pure inhuman;
The tissues of my lip
Will bruise your eyelids, while I am a woman.

LILLIPUTIAN

SHE hoards green cheeses
On a high moonlight shelf;
Her tea-kettle freezes;
The child is an elf.

Her shiny mind is peopled
By brisk goblins, but
Though castled and steepled
The place is Lilliput:

Where I lie bound by subtle
Spider-web and hair,
And the small feet scuttle,
And the gold eyes stare.

PARTING GIFT

I CANNOT give you the Metropolitan Tower;
I cannot give you heaven;
Nor the nine Visigoth crowns in the Cluny Museum;
Nor happiness, even.
But I can give you a very small purse
Made out of field-mouse skin.
With a painted picture of the universe
And seven blue tears therein.

I cannot give you the island of Capri;
I cannot give you beauty;
Nor bake you marvelous crusty cherry pies
With love and duty.
But I can give you a very little locket
Made out of wildcat hide:
Put it into your left-hand pocket
And never look inside.

FRANCIE'S FINGERS

"Oh, Francie, sell me your fingers
And I will pay you well!"
Sweet flowed that voice, the singer's,
As gillyflowers smell.

"Your fingers are a witch's,
White as china clay,
Thin as willow switches
Pointed up to pray.

For your dinted knuckles
And blue printed wrist
I'll give you my buckles
Of paste and amethyst."

"I will sell my fingers
If you will sell your tongue;
Your voice is a singer's
Whose veins run song.

If apples sprang from heaven
Instead of from the ground,
Their juice could not even
Be sweet as that sound."

"Oh, sell your smallest finger!"
"Your voice is all I fancy!"
"No, no!" replied the singer;
"Oh, no, no!" cried Francie.

THE BOOK TABLE

AMERICAN NOVELISTS AND AN AMERICAN CRITIC

BY LLOYD R. MORRIS

IN a volume published last year Carl Van Doren made an admirable study of "The American Novel," following the development of the form from its inception in our National literature to the close of the nineteenth century. The present book,¹ in which Dr. Van Doren undertakes a discussion of contemporary American novelists, is, in a sense, a sequel to the earlier volume; together they give a picture of American experience and the American mind as they have found reflection in our fiction.

Dr. Van Doren's "Contemporary American Novelists" is unquestionably an interesting, stimulating, and provocative book. It reveals the salient characteristics of his critical equipment: a vigorous and independent judgment, a capacity for acute analysis, fine insight. It reveals likewise an intelligent interest in ideas for their own sake and a receptivity to innovation and to vitality from which our criticism cannot help but benefit.

In some ways the publication of such a book as Dr. Van Doren's is very significant. It shows, in the first place, that we are beginning to have a foundation in criticism for our creative writing. And it indicates that our criticism is becoming intellectually aware of literature as a going concern. For many years the bulk of American criticism has been confused and embarrassed by any reference to contemporary thought or expression; its familiar province has been the past, its atmosphere a dingy and moribund pedantry. Under the influence of the doctrine that "criticism of one's contemporaries is merely conversation," it has largely spent its energy fighting sham battles with antique tactics and obsolete weapons. Under these conditions, to expect from our critics any interpretation of or contact with literature as a vital experience has been almost futile. But within the past few years there have been signs of a change; criticism has had a belated revival of consciousness. Regardless of any agreement with its conclusions, a book like Dr. Van Doren's, in which insight and scholarship have been brought to bear upon the material and the problems of current activity, is assuredly a symptom of health.

That lack of agreement with some of Dr. Van Doren's conclusions is likely to occur is in itself only an indication that they are stimulating and provocative. The book is divided into four sections, of which the first discusses at some length the schools of local color and romance in the American novel with which the nineteenth century was brought to a close. "The prevailing

school of naturalism," Dr. Van Doren observes, "has made its principal advance upon the passing school of local color by a sacrifice of genial neighborliness; no less exacting and detailed than their predecessors, the naturalists have insisted upon bringing criticism in and measuring the most amiable locality by wider standards. Here lies the essential point of difference between the old style and the new."

From his consideration of the matrix of naturalism Dr. Van Doren proceeds to a thorough and penetrating discussion of each of "ten living novelists who seem to him most distinguished or significant," closing his book with "some account of the school of fiction just now predominant." The novelists whom he has selected for extended comment are Hamlin Garland, Winston Churchill, Robert Herrick, Upton Sinclair, Theodore Dreiser, whom he groups together in a chapter suggestively entitled "Argument;" and Booth Tarkington, Edith Wharton, James Branch Cabell, Willa Cather, and Joseph Hergesheimer, who are dealt with in a chapter entitled "Art." Into these two chapters have gone much discriminating analysis and balanced sympathy, and they are full of brilliant flashes of penetration. For example, of Winston Churchill Dr. Van Doren says: "He came during a moment of national expansiveness. Patriotism and jingoism, altruism and imperialism, passion and sentimentalism, shook the temper which had been slowly stiffening since the Civil War. Now, with a rush of unaccustomed emotions, the national imagination sought out its own past, luxuriating in it, not to say wallowing in it. In Mr. Churchill it found a romancer full of consolation to any one who might fear or suspect that the country's history did not quite match its destiny. . . . Morally he [Mr. Churchill] has been strenuous and eager; intellectually he has been belated. Whether he has been writing what was avowedly romance or what was intended to be sober criticism, he has always been the romancer first and the critic afterwards. And yet since the vogue of historical romance passed nearly a score of years ago Mr. Churchill has honestly striven to keep up with the world by thinking about it. . . . Once taken by an idea for a novel, he has always burned with it as if it were as new to the world as to him. Here lies, without much question, the secret of that genuine earnestness which pervades all his books: he writes out of the contagious passion of a recent convert or a still excited discoverer. Here lies, too, without much question, the secret of Mr. Churchill's success in holding his audiences: a sort of unconscious politician among novelists, he gathers his premonitions at happy mo-

ments, when the drift is already setting in. Never once has Mr. Churchill, like a philosopher or a seer, run off alone."

Of Theodore Dreiser Dr. Van Doren says: "Not only has Mr. Dreiser never allowed any one else to make up his mind for him regarding the significance and aims and obligations of mankind, but he has never made up his mind himself. A large dubitancy colors all his reflections. . . . That the sincerity which Mr. Dreiser practices differs in some respects from that of any other American novelist, no matter how truthful, must be referred to one special quality of his own temperament. Historically he has his fellows: he belongs with the movement toward naturalism which came to America when Hamlin Garland and Stephen Crane and Frank Norris, partly as a protest against the bland realism which Howells expounded, were dissenting in their various dialects from the reticences and the romances then current. Personally Mr. Dreiser displays, almost alone among American novelists, the characteristics of what for lack of a better native term we have to call the peasant type—the type to which Gorki belongs and which Tolstoy wanted to belong to. Enlarged by genius though Mr. Dreiser is; little as he is bound by the rigor of village habits and prejudices—still he carries wherever he goes the true peasant simplicity of outlook, speaks with a peasant's bald frankness, and suffers a peasant confusion in the face of complexity."

"The author of 'Penrod,' 'Penrod and Sam,' and of 'Seventeen,'" writes Dr. Van Doren, "passes for an expert in youth; rarely has so persistent a reputation been so insecurely founded. What all these books primarily recall is the winks that adults exchange over the heads of children who are minding their own business, as the adults are not; the winks, moreover, of adults who have forgotten the inner concerns of adolescence and now observe only its surface awkwardnesses." "In contemporary American fiction," he says elsewhere, "Mr. Tarkington is the perennial sophomore."

Rarely has any critic more aptly summed up the special contribution to our literature of Mrs. Wharton than Dr. Van Doren: "From the first Mrs. Wharton's power has lain in the ability to reproduce in fiction the circumstances of a compact community in a way that illustrates the various oppressions which such communities put upon individual vagaries, whether viewed as sin, or ignorance, or folly, or merely as social impossibility." Equally incisive is this comment on James Branch Cabell: "If there is anything as remarkable about Mr. Cabell as the fact that he has represented the chivalrous and the gallant attitudes toward love with nearly equal sympathy, it is the fact that in an era of militant naturalism and of renascent moralism he has blithely adhered to an affection for unconcerned worldliness

¹ Contemporary American Novelists, 1900-1920. By Carl Van Doren. The Macmillan Company, New York. \$1.75.

And Now — The Barrett Specification Roof!

FROM corner-stone to cornice, the modern structures that house the nation's business are built to endure. The foundations rest on bed rock. Steel frame-work and steel girders support the weight of walls and floors. And when they are ready to be roofed the great majority of them are covered with Barrett Specification Roofs.

That these roofs should be the almost unanimous choice of owners and architects of such buildings, is not surprising when you consider — That we can name many roofs of this type in good condition after forty or more years of service. Their durability is *proved*, not estimated.

That they are *bonded* against maintenance expense. Barrett Inspection Service during construction insures strict compliance with the roofing specifications, and a Surety Company Bond absolutely protects the owner from all roof repair during the bonded period.

That moderate first cost and guaranteed freedom from maintenance make them the most economical roofs it is possible to build.

That they provide a degree of fire protection not

exceeded by any other roof. They always take the base rate of fire insurance.

The Barrett Specification Type "AA" 20-Year Bonded Roof represents the most permanent roof covering it is possible to construct, and while we bond it for twenty years only, we can name many roofs of this type that have been in service over forty years and are still in good condition.

Where the character of the building does not justify a roof of such extreme length of service, we recommend the Barrett Specification Type "A" Roof, bonded for 10 years. Both roofs are built of the same high grade materials, the only difference being in the quantity used.

The Surety Company Bond, absolutely protecting the owner from maintenance expense, is issued free of charge on Barrett

Specification Roofs of 50 squares or larger, in towns of 25,000 or more, and in smaller places where our inspection service is available.

THE BOOK TABLE

(Continued)

and has airily played Congreve in the midst of the clamorous, serious, disquisitive bassoons of the national orchestra." And as a last illustration of the quality of Dr. Van Doren's critical comment, this concerning Joseph Hergesheimer: "One comes tolerably close to the secret of Mr. Hergesheimer's career by perceiving that, with an admirable style of which he is both conscious and—very properly—proud, he has looked luxuriously through the world for subjects which his style will fit."

In his final chapter Dr. Van Doren considers the novelists of the "New Style," such "emergent types" as Ellen Glasgow, William Allen White, Ernest Poole, and others; the movement of revolt from the village begun by E. W. Howe, continued with Edgar Lee Masters, whom Dr. Van Doren rightly considers as a novelist, and at its apex in the work of Sinclair Lewis, Zona Gale, and others. A brief postscript on the most significant work of 1921 brings this admirably lucid volume to a close.

Dr. Van Doren's book will prove of decided interest to readers of current fiction who seek an interpretation of the

main currents of significant activity in this field of our literature. It provides the critical and intellectual background in terms of which the accomplishment of our chief contemporary novelists may be reckoned. If there are any defects in Dr. Van Doren's book, the most conspicuous perhaps is the fact that he takes no account of the almost pitiable dearth of an interest in ideas among our contemporary novelists. If the naturalistic account of experience is to make any pretensions to completeness, it certainly cannot forever treat as either negligible or non-existent intellectual experience. Equally it may be urged that the novels of naturalism, largely because they are a product of a revolt from the sentimental tradition, have suppressed all feeling so completely that their content of emotional experience seems limited and impoverished. That the drift toward naturalism has produced a more honest and more competent reflection of American life in American novels is indubitable. But even here the solution of problems of intelligence by means of moral indignation is a characteristic confusion which only a more profoundly integrated self-consciousness is likely to dissipate.

THE NEW BOOKS

TRAVEL AND DESCRIPTION

UNNOTICED LONDON. By E. Montizambert. E. P. Dutton & Co., New York. \$2.

"Is there anything old left in London?" an old lady asked the author of this book when told that he was writing a book about old London. He conclusively shows that there are abundant remains of old London left undisturbed by modern improvements, and his chapters will impart to his readers some of his own enthusiasm for and love of the great city.

WILD FOLK. By Samuel Scoville, Jr. Illustrated. The Atlantic Monthly Press, Boston. \$2.

The wild life of the forest makes a varied appeal. To the hunter with the shotgun it gives scope for the exercise of skill; to the hunter with a camera or a pencil it furnishes an ever-varied art gallery, fascinating by its inimitable beauty; to the naturalist it is a living book, a more inspiring object of study than a printed book; to Mr. Scoville it appeals to friendship. It is astonishing how quickly wild animals, especially birds, discern the friend in the man or the child and how readily they respond to human friendship. The friend has, or may have, the joy of the artist and the naturalist and add thereto the joy of the friend. And he to whom circumstances forbid first-hand excursions will get an excellent substitute in Mr. Scoville's graphic and sympathetic writing in "Wild Folk," and its predecessor, "Every Day Adventures."

RELIGION AND PHILOSOPHY

CONQUEST OF FEAR (THE). By Basil King. Doubleday, Page & Co., Garden City. \$1.75.

The theme of this book is much larger than its title. Its opening sentence indicates the reason: "When I say that during most of my conscious life I have

been a prey to fears, I take it for granted that I am expressing the case of a majority of people." That is, we think, a mistake. The majority of Americans are too audacious. They like to try experiments, to take risks, to confront danger. Perils attract them. In our Army when volunteers are asked for a perilous enterprise more offer than can be accepted. In a crowded thoroughfare most Americans prefer to dodge the automobiles rather than wait two minutes for a clear pathway made for pedestrians by the traffic policeman. But Americans value courage and want power. Their ambition is often greater than their capacity. This book presents religion as affording power and endowing with courage. It presents faith as it is presented in the Eleventh Chapter of Hebrews, as a call to endeavor and an inspiration to heroism. It offers much more than a prescription for the constitutionally timid. It offers a divine companionship which to all who accept it inspires the courage to undertake and the power to achieve the impossible. Its motto might well be General Armstrong's saying, "Doing what can't be done is the glory of living."

MISCELLANEOUS

PRINCIPLES OF INTERIOR DECORATION (THE). By Bernard C. Jakway. Illustrated. The Macmillan Company, New York. \$2.50.

Without being especially original, this book presents in simple, orderly, lucid fashion the accepted canons of decorative art in their application to household belongings. It will prove extremely helpful to a host of seekers after light on the problems of home decoration. It is intended for such students rather than for the artist or the professional designer.

CONTRIBUTORS' GALLERY

GUGLIELMO FERRERO, the eminent historian and *savant*, was born in 1872. He has traveled throughout Europe, lecturing on militarism and Roman history. He is the author of "Symbols" and "The Greatness and Decline of Rome" and collaborated with Professor Lombroso in "The Female Offender."

ELINOR WYLIE is a distinctive voice among the younger poets. Her first volume, "Nets to Catch the Wind," was published in 1921, and was promptly heralded as one of the important books of verse of the year. This is the second time that Mrs. Wylie's work has appeared in The Outlook. Many of our readers will remember her "Spring Pastoral," which was printed in our issue of August 4, 1920.

MAJOR-GENERAL SIR GEORGE ASTON again favors The Outlook with one of his authoritative articles from England. He has had a distinguished military and naval career; he has seen hard service in India, South Africa, and the Sudan; and yet he can find joy and relaxation in his favorite pastime—that of fishing.

NEWTON FUESSELE contributes to this issue the inside story of Washington's war on civil service. His last Outlook article, based on an interview with General Pierce, President of the National Collegiate Athletic Association, brought to National attention one of the most important athletic controversies of recent years.

HOWARD BEMENT rises to the defense of his own profession in a spirited article entitled "The Amenities of Schoolmastering." Mr. Bement has been a member of the English faculty of the Hill School, at Pottstown, Pennsylvania, since 1905, and for the last ten years has been head of the English Department. He is a graduate of the University of Michigan and has studied at the Leland Stanford University and at the University of California.

HENRY HOYT MOORE, whose photographs of the Storm King Highway appear in this issue, has long been a devotee of the advanced movement in photography. His photographs have within the past year or two been exhibited in the London Salon of Photography, the International Photographic Exhibitions at Copenhagen and at Los Angeles, etc., and have appeared in the Annual of the Pictorial Photographers of America, of which organization he is an officer. He is Art Manager of The Outlook.

By a regrettable oversight acknowledgment to the Republic Iron and Steel Company was omitted from the caption of the picture of a puddling furnace in last week's issue of The Outlook. We wish to extend our tardy thanks for the privilege of publishing this picture.

Radically Reduced Fares PACIFIC NORTHWEST

Round trip from Chicago

\$86⁰⁰ Seattle-Tacoma — twin capitals of a vacation universe. Would you conquer mountains it is but a few hours to snow-clad Rainier or to the Olympics—the range in the sea. Camp in the Cascades under mighty firs; cruise on island-dotted Puget Sound, glimpsing the Pacific through the Strait of Juan de Fuca.

\$104⁰⁰ Pacific Coast Tour —including the Puget Sound country; Portland and the Columbia River Highway; thence via rail or boat to California. Choice of routes returning.

Corresponding reductions from your home town. Tickets now on sale.

And in traveling to the Puget Sound Country you can ride over the World's Longest Electrified Railroad. The use of "white coal" eliminates soot and cinders, enabling you to thoroughly enjoy, from open observation cars, the most stupendous mountain scenery.

The famous "Olympian" and the "Columbian" between Chicago and the Northwest are electrically operated for 649 miles.

FINANCIAL DEPARTMENT

The Financial Department is prepared to furnish information regarding standard investment securities, but cannot undertake to *advise* the purchase of any specific security. It will give to inquirers facts of record or information resulting from expert investigation, and a nominal charge of one dollar per inquiry will be made for this special service. All letters of inquiry should be addressed to THE OUTLOOK FINANCIAL DEPARTMENT, 381 Fourth Avenue, New York

"CONSISTENT WITH SAFETY"

MORE than half of the many letters which reach the Financial Department from people seeking investments ask us to mention securities returning as high a yield as is "consistent with safety." This is only natural, for safety of principal and high yield is the ideal combination, and a high yield can be obtained if the investor's definition of the word "high" is not too exacting. It should be borne in mind, however, that a high yield under present conditions may have been regarded as a low yield some years ago. High and low are

comparative terms, and as applied to investments must be regarded in the light of conditions obtaining at the time the investment is made.

When money rates are high yields too are high, and when money rates go down yields keep pace. It is essential that investors remember this fact, and any attempt to obtain a yield on an investment to-day which is equal to that of three years ago is liable to be risky business. The post-war inflation years brought with them investment opportunities such as few people

Complete Service to Corporations

BEGINNING with its organization and at every stage in the existence of a corporation, this Company can be of service in all banking and fiduciary capacities.

Commercial Banking

We pay interest on balances in our New York and foreign offices; extend commercial credit; and render complete foreign banking service.

Escrows

Cash, securities, commodities, and documents to be held in escrow can be deposited with us under an agreement or letter of instructions.

Transfer Agent, Registrar

Our Transfer Department can relieve the corporation of many intricate details in connection with the transfer of stocks, the maintenance of records of stockholders, and the disbursement

of dividends. Our services as registrar are desirable as a check against over-issue of securities.

Readjustments

In connection with mergers or corporate readjustments, our agency services and business counsel can be of great value to the corporation and its security holders.

Trustee

This Company is thoroughly equipped to act as trustee under issues of mortgage bonds, collateral trust bonds, and other types of securities.

Safekeeping of Securities

The security holdings of the corporation can be placed in our care. We will collect the interest and principal, and attend to routine details. The securities are always available.

We shall be pleased to confer with executives of corporations and with lawyers, and to explain in detail how our services can be of value.

Guaranty Trust Company of New York

140 Broadway

had ever seen before, and of a sort that in all probability few will ever see again. Times have changed since then and yields are now comparatively low. The investor will do well, therefore, to forget what used to be and confine his attention to what is. The general rule that the higher the yield the greater the risk still holds good, and simply because the best-grade securities used to return from 6 to 7 per cent is no guaranty that 6 to 7 per cent can be had to-day without a certain risk attached.

Some of the people who write to us specify bonds, some stocks, and some merely "investments." But in practically every case they want as high a yield as is consistent with safety. Certainly it is not worth while sacrificing safety for yield. For example, if a man puts \$1,000 into an investment his first concern should be the protection of his thousand dollars. Suppose two investments are offered him, one yielding 5½ per cent and the other 7; naturally he would like to buy the one yielding 7 per cent. Seven per cent a year on \$1,000 is \$70, and 5½ per cent amounts to \$55. The difference is \$15 a year, not a sufficiently large sum to justify him in risking his principal. Get the higher yield if it is consistent with safety, but if risks are involved remember that the difference between 5 and 6 per cent and 6 per cent and 7 is, after all, only \$10 a year. When people figure it out on that basis and there are any doubts in their minds, they are often more agreeable to the lower yield.

There are other factors than safety which play their part in determining the yield of an investment. Marketability is a characteristic which is regarded as valuable enough to make the yield of a readily salable security less than that of one for which there is little demand. Lower yield of course means a higher selling price. There is no denying that it is worth something to know that there is a good demand for one's securities, and that in case you wish to sell there are plenty of people eager to buy. We believe investors should give marketability their careful attention, and that enough of their investments should be in this class of securities to supply them with enough ready cash to provide for any emergency. Beyond this point it is not essential and many persons believe that an investment worth buying is worth keeping. There is much to be said for this point of view, and if it is possible to forego marketability the yield consistent with safety may often be increased appreciably.

Bond yields generally are lower than the return from investments in stocks. Patently the explanation of this fact is that bonds are, as a class, safer investments. What security has a stockholder for the payment of dividends other than the margin of the company's earnings over requirements? Bond interest is a charge on earnings ahead of any claim that stockholders have; if interest is not paid, the bondholders can sell the property pledged as security for their bonds, but what recourse have stockholders

No loss to any investor in 49 years

THE GOVERNMENT

—The Largest Investor in Washington Real Estate

Washington enjoys the distinction of being the only city in America which has back of it the tremendous power of the United States Government in civic improvement and development.

Called by many travellers the most beautiful of the capital cities of the world, and the most beautiful of the larger cities of America, it is the Mecca of tourists from every State in the Union.

The Government builds in Washington; the Government is the most potent factor in creating and sustaining the demand for land and buildings in Washington; *the Government is the largest investor in Washington real estate.*

In Washington, the seat of Government, you can buy 7% First Mortgage Investments from this investment banking house which has been identified with the growth and development of the Nation's Capital since 1873 and which has back of it a record of *no loss to any investor in 49 years.*

For full information about investing \$100, \$500, \$1,000 or more outright or under our 7% Investment Savings Plan write to

The F. H. SMITH CO.

Founded 1873

FIRST MORTGAGE INVESTMENTS

WASHINGTON, D. C.

The cradle of modern textiles

WITH crude spinning wheel and wooden loom, Colonial weavers of New England produced cloth equal to Europe's best. Influenced perhaps by fine Oriental cloth imported by adventurous sailormen, they improved in skill each year.

Certain families excelled in the art, and cloth woven in these homes was highly prized. Mechanically inclined neighbors helped invent faster working devices. Commercial manufacture, beginning in 1788, increased until textile production became the premier industry of the district, as it is to-day.

Capital and Surplus
\$20,000,000

THE NATIONAL SHAWMUT BANK
of BOSTON

All eyes now look toward New England for cotton and woolen cloth. Here is also the home of good textile machinery for all the world. A vast international commerce centers around the industry, helped materially by the counsel and financial co-operation of The National Shawmut Bank.

Technicalities of the textile trade are every-day details in this bank. Direct representation in every city and port enables us to handle import and export business rapidly, accurately and thoroughly. It is a service founded on complete understanding of the needs.

FINANCIAL DEPARTMENT

(Continued)

when no dividend disbursements are forthcoming?

Many inexperienced persons seem to have the idea in their heads that stock on which dividends are cumulative is in some way secured like a mortgage bond. Only recently we had a letter from a man who owned a number of shares of cumulative preferred stock of one of our newly reorganized railways. He had received no dividends for several years and several hundred dollars due on his stock had accumulated. He needed the money, and he wanted to know if there was any way in which he could force payment. We looked into the records. Let alone earning anything for dividends, the road in question had not earned the interest on its bonds for some time and had been obliged to borrow from the Government in order to meet its fixed charges. Naturally there are no dividends unless there are sufficient earnings. Cumulative dividends apply to preferred stocks, and all they mean is that payments must be made on the preferred issues before anything can be distributed to the common stockholders. A 6 per cent cumulative preferred stock may not be worth much more than the common which follows it if there are no earnings.

A stockholder is a partner and a bondholder is a creditor. It is profitable to be a partner in a prosperous concern, but expensive if operations result in losses rather than profits. A bondholder, on the other hand, loans his money to the company, and certain property is usually pledged for the repayment of the loan, and the company further obligates itself to pay him a fixed rate of interest for the use of his money. Profits are of relatively slight importance so far as a bondholder is concerned, and correspondingly he is not so vitally concerned in a lack of profits. The return on his investment is fixed; he expects no more, and in case any less is offered him can take matters into his own hands and force payment. The price of sound bonds—and price of course determines yield—fluctuates with conditions in the money market rather than with earnings, although obviously the margin of earnings over dividend requirements is an important consideration. Stock quotations, however, are largely governed by earnings, and earnings are bound to fluctuate.

One of our friends told us recently that in settling up his father's estate he found that all the stocks had greatly appreciated in value over their purchase price, while most of the bonds are worth less now than when they were bought. Our friend had immediately made up his mind to buy no more bonds, but to confine his investments in the future to stocks. He had not considered the case dispassionately, however. At the time his father bought most of the bonds money rates were exceedingly low, bond prices were high—higher than they are to-day—and yields of course away down. Conditions have changed since then and

high-class bonds are selling for less than they were twenty years ago. This does not necessarily mean that the bonds in question are less safe than they were, however, and our friend had overlooked the fact that his father had been receiving his interest on them regularly. Stocks purchased twenty years ago in sound, well-managed companies should naturally be worth more now than then, because if the companies have lasted that long their businesses would in the ordinary course of events have expanded and developed and earnings increased. At the time of purchase, however, it is a fairly safe assumption that they were more of a risk than the bonds and required closer attention. Likely enough, there were years when no dividends were paid. Evidently the father was a shrewd investor, but he must have kept in close touch with his stock holdings, and of course there is no record of the stocks he may have sold at a loss.

The conclusion is that as a general proposition bonds are safer investments than stocks. There are good bonds and bad bonds, just as there are good and bad stocks, but, granting that bonds are better, the yield of a bond "consistent with safety" should be judged by the yield on bonds generally, and the yield on stocks by the standard of stock yields. Some people are in a position to accept the risks involved in the ownership of stocks, while others cannot afford any chances at all. Safety, in other words, is a relative term, depending upon the circumstances of the investor. The proper method of procedure, therefore, is for the investor to decide, first of all, whether he wants to buy bonds or stocks. With this point settled, it is much easier to tell what kind of yield he can get "consistent with safety."

BY THE WAY

“ONE of the last pleas made to me when I left Russia,” says George Barr Baker in a Bulletin of the American Relief Administration, “was for at least one food remittance a month and some small sums of money for two daughters of Tolstoy, who are permitted to maintain their father’s home in the country as a public museum, but who are continually taking in young literary people and putting them to work around the grounds or in the library, without sufficient funds to pay them or adequate food for themselves or their people. I was informed that it would be foolish to give these ladies much at any one time, as they would use it in the relief and support of others.”

Of every 1,000 automobiles in the world, 843 are owned in the United States and 37 in Canada. This means that eighty-eight per cent of all the automobiles are found in these two countries. Great Britain has four per cent of the total number of auto vehicles, France two per cent, and in all other countries combined are found the remaining six per cent.

The race for records in transatlantic travel seems fairly on again, with the many new and splendid oil-burning steamships that are now in commission. These ships make the port of New York, as “Shipping” says, the supreme port of the world. The Mauretania, refitted as an oil-burner, recently made the voyage from New York to Cherbourg in five days ten hours and nine minutes. This is believed to be “the fastest time made by any transatlantic liner since the beginning of the war in 1914.”

An advertisement in a San Francisco paper reads: “Lost—Average diamond Engagement Ring. Reward to finder,” etc. What is an “average” engagement ring? Is it the regulation style that the lady receives when she gets engaged for the dozenth time—or that the man gives to his latest fiancée? Or does “average” refer to the size of the stone? Is half a carat the average, or a carat and a half? Perhaps some expert can answer one or all of these questions.

A London newspaper contains an advertisement of an old English home to be sold, which begins in the familiar style—“12 bedrooms, 4 sitting-rooms, paneled dining room, ingle nooks, dower chests,” etc., and suddenly breaks off from the catalogue of ancient blessings with this modernism: “But, owing to electric light, No Ghost.” One hardly knows whether this exception will add to or detract from the “pulling” power of the announcement.

Apropos of a catalogue of bulbs sent recently to “Th. Roosevelt, Esq., The Outlook, New York City,” by a Dutch firm of florists, a subscriber sends us a circular from another Dutch firm which contains this announcement: “We guarantee our bulbs to be free from any disease. Our stock is thoroughly in-

Sermons in Wood

IT is a well recognized fact that no material lends itself so effectively to the adornment of the church as beautifully carved wood. Some of the most interesting art treasures of the past are preserved in this expressive medium.

The giving to the church of a pulpit, an altar, a lectern, or other suitable fitment in carved wood, either as a memorial or simply as a tribute to beautify the edifice, is an old and revered custom.

A recent publication of our Ecclesiastical Department is intended to show both the scope of our work and the wealth of opportunity for effective pieces of all kinds, available from our wood carving studios.

If you are interested we will send a booklet on request

BY THE WAY—(Continued)
spected by the Netherlands Phytapato-
logical Service before shipment."

A man, lying on his death bed, called his chauffeur who had been in his service for years, and said, as reported in the "American Legion Weekly:" "Ah, Sykes, I am going on a long, and rugged journey, worse than ever you drove me." "Well, sir," consoled the chauffeur, "there's one comfort. It's all down hill."

"Are you going any farther West?" "I planned to," said the foreign visitor, as reported by the Birmingham "Age-Herald." "Is there any danger from Indians?" "Not if you keep out of the way of their motor-cars."

This from the "Virginia Reel," of the University of Virginia, is a fair hit by an insider:

St. Peter—"You say you were a writer on a college comic magazine?" Applicant—"Yes, St. Peter." St. Peter—"Step into the elevator, please." Applicant—"How soon does it go up?" St. Peter—"It doesn't go up; it goes down."

Why does half the world read and write from left to right, and the other half from right to left? Perhaps this is not a perfectly correct wording of the question, for a quarter of the world (the Chinese) read from top to bottom, and the ancient Mexicans wrote from bottom to top. Professor Ege, of the Cleveland School of Art, says, apropos of the question, in the "American Printer:"

The Japanese and Chinese do everything "backward" to our way of thinking, for they pull instead of push a saw, they unlock their doors by turning in the opposite direction, they read "backward" and also write "backward." In 80 per cent of Western art we enter a painting from the left and explore toward the right. Our center of interest is slightly left of the physical center. In the Orient, 90 per cent of their pictorial art will "read" from the right to the left, with chief attraction to right of center. Mr. Lafcadio Hearn "claims the oppositeness probably implies experiences evolutionally younger than our own." To complete the vagaries, the Mexican picture writing starts at the bottom of the column and reads upward.

The primates closest to man are ambidextrous, and primitive people are frequently so. Left-handedness is common to only 2 or 4 per cent of people East and West, so that cannot account for the difference in the direction of writing. Left-to-right order permits the eye to follow the text easily, and when writing liquids are used it is certainly the only logical way. Common sense seems to be the reason for writing left to right, but that same common sense should dictate that our printed books should be executed in boustrophedon order.

Boustrophedon writing, it may be explained, means writing like that of the Ionian Greeks, the first line reading from left to right, the next line from right to left. This saves the time involved in going back from the end of a long line to begin again at the left.

X61—White Gold Filled, 17 jewels, Precision movement, \$47.50; solid white gold, \$62.50.

THE mark "Precision"
on a Gruen Watch indicates the highest timekeeping perfection attainable.

It is an *exclusive* Gruen marking, devised by the Guild as its pledge of fine workmanship in a watch movement.

The sale of Gruen Watches is confined to the best jewelers in each community. Look for the Gruen Service Emblem displayed by leading jewelers.

THE MAIL BAG

THE "HEIGHT-WEIGHT" CONTROVERSY

I—LETTERS TO MR. TAYLOR

"DELUSION" is the word. They have made a fetish of their tables. It has become an obsession. I want all your publications, please. I have been weighing and measuring Chinese, Japanese, and Hawaiians for five or six years. The average weight—height for height—for Chinese is eight per cent below the American children. Obviously, if, using American standards, you notify parents as requiring special attention all under-weights of seven per cent or more, you are notifying Chinese who by appropriate standards of their racial build are a good average, or even one per cent above normal average. ISAAC M. COX.

Hawaii.

I am interested in your method of selection of the cases upon which are based the measurements which you give in these tables. From your statement, about one in ten boys is well developed. I infer that the standard measurements for shoulder girth, chest girth, etc., are based on individuals who are in good health and who have good muscular development.

It seems to me that you have made an important contribution to the methods of judging the physical condition and development of children.

ROBERT M. WOODBURY,
Director, Statistical Research,
Children's Bureau,
U. S. Department of Labor,
Washington, D. C.

Kindly enter our order for your handbook containing your tables, which we understand is to appear in three weeks or a month. We are interested in obtaining these tables on account of the fact that we have lowered our age limit for writing standard policies down to ten years. We believe we are the first company to issue a standard policy for an applicant of that age and up. No reliable figures or statistics are available so far as measurements and weights of boys and girls of the lower ages are concerned, and we believe, with you, that mere slenderness and apparent under-weight are not disadvantages and can in many cases be considered as normal weight for insurance.

CLINE F. RAMEY,
National Fidelity Life Insurance Company,
Sioux City, Iowa.

II—FIELD WORK VS. LABORATORY THEORY

THE country school-ma'am, whose letter was published in The Outlook for April 19, willfully ignored Mr. Taylor's emphasis on his form of examination of school-children because for the 12,000,000 or more rural school-children in the United States such an examination is so very rarely possible as to be not worth considering.

Mr. Taylor is viewing health educa-

tional work from a position that is near ideal. He was not fair in so ruthlessly condemning the most effective tool that we pioneer health workers have.

Our county nurse has a territory of about 900 square miles, with 78 rural schools, 5 villages, and the county seat. In her dust-covered Ford, with scales and the condemned weight tables, making such superficial physical examinations as she can, she has in less than two years' time created a real interest in the heritage due the children as regards physical development. Without a definite standard such as this weight table she could not have done this.

If she and all her co-workers accept Mr. Taylor's theory that this standard is a delusion, what are they to use instead? Would you have us teachers explain to our pupils and the parents when the Red Cross Ford has left our school that the thin ones are not under-weight, but specimens of the tall, slender type?

Viewing the question from the first round of the ladder that leads to practical and adequate health education, don't you think Mr. Taylor might have been less severe in voicing his disapproval of the weighing and measuring of school-children? We have no McCurdys nor Dr. Lipperts to stimulate wholesome ideas or ideals among these 12,000,000 sons and daughters of the soil. Why hold the public health nurses up to ridicule when we all know that they are doing what they can do while they wait for better things to come?

Incidentally, I am wondering how many of Mr. Taylor's supporters are "under-weight" or the parents of "under-weight children." I have noticed in school that they or the fat types are the ones to most quickly condemn the tables when weight reports are sent home.

Sincerely yours for better health education,

PEARL E. WILSON.

El Reno, Oklahoma.

A LETTER THAT WAS GOOD FOR A SUBSCRIPTION

A DAY or so ago I received a notice that my subscription to The Outlook was about to expire. I observe that a man in the State of Maine is trading several jars of wild-blackberry jelly for The Outlook. Pretty soft for the man in Maine. I wish also that I had some wild-blackberry jelly. Pretty nice to be on The Outlook staff! Were I a baker, I would offer you cookies in quantity for my Outlook. But I am not a baker. You will have to get your bread or cookies elsewhere then.

I have the misfortune, just at present, to be broke. Thus I am, at present, unable to dig up the needful wherewith to renew my subscription. Fortunately, my credit is good at a local drug store, where I can either buy The Outlook on time or, better yet, can peer carefully through it while some old lady keeps the clerk busy at the drug counter. I

am not at all Scotch; but the Scotch are good folk to follow when you are broke. Later on I shall send you my subscription for The Outlook. Just now I will have to mosey about in search of the needed moidores. I have so many bills to pay; and the wife and child have to be fed and more or less clothed. Also our dog, Trouble, has to be fed. He is a ravenous animal and one of the family. It seems foolish to feed a dog when one is broke to many people, I know. But for dogs I have an affection. I once had a dog of whom I thought almost more than I thought of my wife. My wife was in the same fix. She thought almost more of the dog than of me. That old dog is no more—not, that is to say, here. Conan Doyle may have some information as to where he sits to whimper at the moon. I do not know. He and I (and the wife) saw troublous times together. Trouble brings folks into close company. Trouble is a fine thing in this old world. I would not be without trouble even had I to forego my Outlook.

Ah—speaking of being broke, and of trouble, and of dogs, and of people in general, reminds me of a Christmas pudding. It is odd how a person wanders when he sits down to explain to an editor why he cannot at once renew his subscription, is it not? Editors must have a great time.

I have a sympathy, not unmixed with a hatred, and an affection also, for Editors. I do not know why I give them a capital E. I believe them to be fiercely carnivorous.

But about that Christmas pudding.

I was at that time remarkably hard up, indeed. I was far worse off than I now am, for I had no credit at all anywhere. It was very close to Christmas, and after a good deal of confabulation my wife and I had decided that, as I had seen a holly tree in a rich man's garden, the garden having a very low and easy-to-climb wall about it, we must at all costs have a regular old style Christmas pudding. The holly was there.

But this is a story interesting alone to myself and my wife and the ghost of our departed dog, who was accused by neighbors yet poorer than ourselves of having stolen their Christmas cake. We made it up, knowing all the time that our dog was innocent, by presenting them with our cherished Christmas pudding.

They returned the pudding toward mid afternoon (the people who are hard up eat "dinner" at noon—I fancy dudes call the midday meal "lunch"), saying, "We don't have no use fer rich things." They had used only half of it.

Later the dog who stole their cake was discovered. But too late to retrieve a Christmas spoiled for two families.

This has nothing at all to do with anything; but Editors were especially made to suffer and to torment.

Thus, with the very best wishes imag-

PUBLISHER'S NOTES

inable, and assuring you that I shall quite likely come by (either honestly or otherwise) the sum needed to renew my Outlook, I close, sincerely,

BILL ADAMS.

P. S.—I don't know how he got that way; but the last alienist said that I was perfectly sane.

[Maybe we can publish the full story of that pudding later. Next Christmas, perhaps.—THE EDITORS.]

THE WIDOWER

BY VICTOR STARBUCK

HE does the same old things: three times a day
Sits down to meat, and once climbs up to bed,
Just as he did before his wife was dead.
Grief has not changed him much, the neighbors say:
He knots his tie the same fastidious way,
And still likes jam and butter on his bread
And syrup on his cakes. Well-groomed, well-fed—
As jaunty as a sparrow cock in May.

And one would think him quite indifferent, save
For that unconscious groping of his hand
That seeks but never finds. I half believe
His mind sits always by a new-made grave,
And that perhaps he wears a mourning-band
Around his heart, instead of on his sleeve.

THE RESTLESS DEAD

BY ROSELLE MERCIER MONTGOMERY

SAID Death, the king, unto the jester, Fate:
"My subjects chafe, those who have come of late—
They say their narrow beds are hard and cold;
And they would wander, as they did of old!"

Said Fate, the jester, unto Death, the king:
"Let them go free, let them go wandering;
Let them go back and visit once again
The scenes they loved there in the world of men.

"Yes, give them freedom—let them have their hour
And give to each returning ghost the power
To stay among his loved ones as of old,
Provided he shall find them—unconsoled!"

So spake the jester, Fate, to Death, the king,
And all the troubled ghosts went wandering.—
Next day Fate asked: "How fare the restless dead?"
"Now all are quiet in their graves!"
Death said.

Westinghouse Electric and Manufacturing Company

AN OUTLOOK EDITOR AT WJZ

READERS of The Outlook already know that The Outlook has been co-operating with the Westinghouse Company in the preparation of its radio broadcasting programmes. Since the last of April, members of the editorial staff of The Outlook have journeyed weekly to Newark, where the broadcasting plant of the Westinghouse Company is located, for talks over the radio phone on current events. It is estimated that these radio programmes are probably heard by three or four hundred thousand people. The Westinghouse Company has had reports from as far west as the Pacific coast and as far south as Cuba of the successful receipt of its lectures and music. The Outlook would like to know how far its talks on current events have carried and will welcome information from any of its subscribers who have heard the voices of its editorial staff at a distance. We publish on this page a picture of Mr. Ernest Hamlin Abbott talking over the radio in the Westinghouse broadcasting room.

WITH the closing of the schools many letters have come to The Outlook from teachers, telling of the help which The Outlook has given them in the teaching of civics and current events. We publish herewith a few extracts from the many letters which we have received:

I first became acquainted with The Outlook about five years ago when I was attending high school, and it was here that I found the value of The Outlook as a current history magazine. This year when I began to teach American history I saw the need of a good current history magazine, and so I examined several leading magazines, but I found that The Outlook was best suited for my purpose. I want to say that the students

enjoy reading The Outlook and they were anxious for the day to come when The Outlook came. I found that The Outlook filled the place I expected and in some cases it went beyond what I expected of it. I intend to use The Outlook next year and can highly recommend it to any one in search of a good current history magazine, both as a home magazine and a school magazine.

H. A. PARKER,
Principal of High School,
Oran, Missouri.

We have used your magazine for a great many things during the past year and shall continue to use it. We used it for current history in our history classes, for current events work in English classes, for short stories and essay work in English classes, and found it exceedingly valuable in coaching our current events team for our annual current events contest in the Wabash Valley Association.

E. O. MAY,
Principal of High School,
Robinson, Illinois.

We have used The Outlook in our high school for the last half year. Teachers and students alike have nothing but commendation for it.

P. O. WAGNER,
Superintendent of Schools,
Oak Hill, Ohio.

I shall ask my students to subscribe to The Outlook during the summer, for I shall be glad to have your influence over them during vacation. If I were an English instead of a history teacher, I should insist upon The Outlook first. Personally, I am glad to be taught by an editorial staff whose judgment I trust and whose inspiration I am glad to acknowledge as one of the joys of my teaching.

GENEVIEVE MARSH,
McKinley Manual Training School,
Washington, D. C.

VERY REMARKABLE

vironment.

Brass A Novel of Marriage

By **CHARLES G. NORRIS**

Not *your* type of woman, of
course, but women of whom there
are thousands filling the divorce
courts. Why?

The Critics Say:

Town and Country: "At least it does say something
definite on an actual problem of contemporary
life."

Phila. Public Ledger: "Never has there been pre-
sented such a dispassionate, keen and unsparing
study of the institution of marriage."

Baltimore News: "Of amazing sweep and even more
amazing power."

Joanna Godden

By **SHEILA KAYE-SMITH**

Author of "Tamarisk Town,"
"Green Apple Harvest," etc., etc.,
the ranking woman novelist of
England. She paints with won-
derful insight a woman whose
opportunity is at war with what
her world expects of her sex.

The Critics Say:

Donald Adams: "There is not a woman in the gal-
lery of contemporary fiction who is so real to us
as Joanna Godden."—*N. Y. Herald.*

N. P. Dawson: "She is the most vivid, original real
person that was ever put into a book."—*The
Globe, N. Y.*

Louise M. Field: "Joanna is one of the memorable
women of fiction, vivid, faulty, human, real
through and through."—*New York Times.*

Lilia Chenoworth

By **LEE WILSON DODD**

Author of that unusual picture
of a modern girl, "The Book of
Susan."

The Critics Say:

H. L. Pangborn: "The portrayal of a heroine who
really has anything inside her beautiful head is
uncommon enough. It is a difficult task to pre-
sent such a girl even without the added touch of
her genius. But Mr. Dodd has done it. The
result tempts to superlatives."—*N. Y. Herald.*

John Farrar: "It seems to me the best novel of the
spring . . . emotionally moving and technically
satisfying."

Another recent Dutton novel is a satisfying
love story, old-fashioned enough to end hap-
pily, yet quite modern.

Barbara Justice

By **DIANA PATRICK**, author of "The Wider
Way" and "The Islands of Desire."

Training for Authorship

How to write, what to write,
and where to sell.

Dr. Esenwein

Cultivate your mind. Develop
your literary gifts. Master the
art of self-expression. Make
your spare time profitable.
Turn your ideas into dollars.

Courses in Short-Story Writ-
ing. Versification. Journalism.
Play Writing. Photoplay
Writing, etc., taught person-
ally by Dr. J. Berg Esenwein,
for many years editor of Lippincott's Magazine, and
a staff of literary experts. Constructive criticism.
Frank, honest, helpful advice. *Real teaching.*

One pupil has received over \$5,000 for stories and
articles written mostly in spare time—"play work," he
calls it. Another pupil received over \$1,000 before
completing her first course. Another, a busy wife
and mother, is averaging over \$75 a week from
photoplay writing alone.

There is no other institution or agency doing so much
for writers, young or old. The universities recognize
this, for over one hundred members of the English
faculties of higher institutions are studying in our
Literary Department. The editors recognize it, for
they are constantly recommending our courses.

We publish *The Writer's Library*, 13 volumes, descriptive
booklet free. We also publish *The Writer's Monthly*, the lead-
ing magazine for literary workers; sample copy 25 cents, annual
subscription \$1.00. Besides our teaching service, we offer a
manuscript criticism service.

150-Page illustrated catalogue free. Please Address

The Outlook

JUNE 21, 1922

AN ADMIRAL-PREMIER WITH ANTI-MILITARISTIC POLICIES

FURTHER developments in the political situation in Japan confirm the impression made by the earlier reports that the Japanese Government is committed to both domestic and foreign policies of a progressive character.

Perhaps American readers of the newspaper despatches from Japan may, at first, receive the impression that the Japanese Government is reverting to the control of the militarists because the new Prime Minister of Japan, who succeeds Mr. Takahashi, is an Admiral and a Baron. As a matter of fact, however, Admiral Baron Kato, who is now at the head of the Japanese Cabinet, is a man of liberal mind. He was a close friend of Mr. Hara, Mr. Takahashi's predecessor, who quietly brought about a great change in the Government of Japan by establishing more than one democratic precedent. As we said last week, Mr. Hara was virtually the first Japanese Prime Minister to substitute for military control of Japanese foreign policies and even domestic matters the precedent of party control. In carrying out his purpose, he sent Admiral Baron Kato to Washington as head of the Japanese delegation and assumed the naval portfolio himself; and in that he had Admiral Baron Kato's co-operation. Admiral Baron Kato, upon his return after Mr. Hara's death, resumed the naval portfolio, which (in spite of the Constitutional provision that ministries of the navy and army should be in the hands of officers of the respective services) had been held for the first time in civilian hands, first by Mr. Hara, and then by Mr. Takahashi. The fact that Admiral Baron Kato is now Prime Minister does not indicate a return toward militarism, but may, on the contrary, result in further progress toward genuine party control and more truly representative government.

The Seiyukai party, with which Admiral Baron Kato is virtually identified, faces a general election in May of next year. In order to maintain its power it recognizes that it must keep up with the developments of the democratic feeling in Japan, and must therefore promote measures of reform. The leaders of that party have watched with interest the result of Admiral Baron Kato's labors at the Washington Armament Conference and have observed the reception which he got upon his return to Japan. At first the Japanese people felt

that the Japanese delegates had sacrificed too much, and public opinion showed itself in the cool reception given to Prince Tokugawa, who was the first of the Japanese delegates to return. Gradually, however, the real purpose and spirit of that Conference became known, and when Admiral Baron Kato returned he persuaded the people of Japan that the nation had not been sacrificed, but, on the contrary, had made a great gain through the spirit of conciliation and friendship which had been developed by the mutual naval sacrifices voluntarily made at Washington by the nations there represented. Though there are strong opponents of Admiral Baron Kato, he has the support, not only of his party, but of a preponderant opinion of the people. The Seiyukai party, naturally cautious with the forthcoming election in prospect, has chosen Admiral Baron Kato, not primarily because he is a naval man, but because he is a supporter of the party's programme in favor of representative government, and because of his popularity.

It is expected that the new Premier will adopt the ratification and carrying out of the Washington treaties and will cut down the expenses of the Government, particularly for military purposes.

Among those who have left the Cabinet are Nakabashi, Motoda, Yamamoto, and Noda, who are all elderly and more conservative men. Their places in the Ministries of Education, Railway Transportation, Agriculture and Commerce, and Communications, respectively, have been taken by Kamada (President of Keio University), Oki (who was Minister of Justice in the former Cabinet), Arai, and Maeda (a young radical peer).

Admiral Baron Kato, besides being Premier, is Minister of Marine (that is, of the navy); Viscount Uchida is Minister of Foreign Affairs (as he was under the Hara and Takahashi Governments); Mizuno is Minister of Home Affairs (a proved, able man, formerly vice-Governor of Korea); Ichiki (a leading Kenseikai man in the House of Peers) is Minister of Finance; Yamanashi (a general) is Minister of War; and Okano (recently President of Chuo University) is Minister of Justice.

Not all the members of this Cabinet are members of the Seiyukai, for some are non-Seiyukai men from the House of Peers; but the Cabinet has the support of the Seiyukai party, which has a large majority in the Japanese Diet. The majority of this Cabinet are members

of the House of Peers, which is not a merely aristocratic body like the British House of Lords, but is in some respects more radical than the Diet. It thus happens paradoxically that a Cabinet composed chiefly of Peers represents a step in the development of the democratic spirit in Japan; that a Cabinet constituting what is virtually a coalition Government represents a step in the development of a responsible party system; and that a Cabinet under the Premiership of a member of the military class represents a step in the development of civilian control.

ADAMANT—FRENCH AND AMERICAN STYLE

A GROUP of bankers, forming an international committee of which Mr. J. P. Morgan is a member, considered in Paris the floating of a loan to Germany. The purpose of such a loan would be to enable Germany to pay the amounts due from her in reparation of the wanton damage which she did during the war.

Under the treaty which Germany signed at Versailles, she is obliged to pay in accordance with terms arranged by the Reparations Commission. When the bankers examined the situation, they found that they were not willing to recommend a loan to Germany except on terms which would almost inevitably lead to a reduction in the amount of reparations demanded from Germany. If Germany were willing to pay the reparations demanded of her, the situation would be different; but Germany is unwilling. From the point of view of those who would like to float a loan, the alternative seems, therefore, further reduction in the demands upon Germany. The Reparations Commission were willing to give the bankers the liberty to set their own terms—that is, all the Reparations Commission were willing except the representative of France. This perhaps is human nature, as France was the chief sufferer from the war. We are all perhaps more ready than we ought to be to forgive those who trespass against—our neighbors.

France probably would be willing to release Germany from some of the damages she should pay if France in turn could be released from some of the obligations which she incurred in driving back the German bandits. Her principal debt is to Great Britain and the United States. Great Britain would be glad to release France from her debt, but she in turn owes something to the United

States, and first wishes to be relieved herself. But the United States is adamant. Not without reason. Why should Americans forego billions of dollars because the European nations find it inconvenient to pay their notes? Didn't America do her share in the war as it was? What seems odd, however, is that Americans, while remaining adamant themselves, are criticising the French for being adamant. Those Americans who are anxious to see Germany released from paying damages for the consequences of her crimes, on the ground perhaps that she was criminally insane, ought to be willing to put their hands in their own pockets, and not expect France to do all the renouncing. As a matter of fact, both France and America have done enough renouncing on Germany's account.

TURKISH ATROCITIES

WHEN that delightful pilgrim from England, Lady Astor, returned home, she is reported to have said, on embarking at the pier in New York, that the American Government had declined the invitation of the British Government to join in official investigation of Turkish atrocities in Asia Minor. This she regretted as an evidence of a lack of humane co-operation among the English-speaking peoples. Lady Astor's native American sense of humor is so refreshing that she will not resent, we are sure, being reminded of the trenchant saying of another native American humorist: "It is better not to know so much than to know so many things that ain't so!" For Lady Astor was wrong. The United States is going to co-operate with Great Britain, France, and Italy in the proposed investigation.

Three weeks ago we reported the invitation of Great Britain and expressed the hope that the United States would participate in the investigation, even if it could not commit itself to any forcible action to put an end to the cruelties and massacres which the Armenians are suffering from the hands of the Turks.

Secretary Hughes has now issued an official statement announcing, as the following quotation shows, that this is the course which our Government is prepared to pursue:

The situation of the Christian minorities in Turkey has enlisted to a marked degree the sympathies of the American people and it has been noted with deep concern that the work of benevolent and educational institutions in Turkey has steadily been hampered, that the rights which American citizens have long enjoyed in Turkey in common with the nationals of other Powers have often been disregarded and the property rights and interests of Americans and other foreigners placed in jeopardy.

In view of the humanitarian considerations which are involved and of the desire of this Government to have adequate information through a thorough and impartial investigation of the actual conditions prevailing in Anatolia, in order that this Government may determine its future policy in relation to the authorities concerned, the President is prepared to designate an officer or officers to take part in the proposed inquiry.

In informing the British Government of the foregoing the Government of the United States has made it clear that the proposed action is limited in scope to an inquiry to obtain accurate data as to the situation in Anatolia for the information of the Governments participating therein, and has stated that this Government assumes no further obligation and enters into no commitment.

In order that the investigation may be thoroughly unpartisan the State Department has suggested that the inquiry be extended to those districts under Greek control as well as to territory dominated by the Turks.

We welcome this official decision voiced by Secretary Hughes (the first of its kind, we think, in the history of the United States) for two reasons. It will give the world the actual facts, backed by the word and authority of four great civilized Governments—France, Italy, Great Britain, and the United States; and it is another proof that the people and Government of the United States do not wish to remain aloof from a humane participation in world problems. A League of Human Help is a very different thing from a hard and fast, legislative, political, military League of Nations.

NEW THREATS OF RAILWAY STRIKES

SOMETHING like a million men are employed in those divisions of railway work which have to do with the maintenance of way and with shop work. These men have been asked by their organization committees to vote on the question of a strike after July 1, in resistance to the recent order of the Railway Labor Board for a reduction of wages in these departments. The results of the ballot have not been announced as we write. Even if the men vote in favor of a strike, it by no means follows that a strike will take place, any more than after the last threat of an extended railway strike.

This question of railway wages is part of the very large problem of the reduction of labor wages to meet the demand for lower prices of goods and lower freights. The Railway Labor Board is in this industry the expert body acting for the public and the Government to determine just such questions. Public

opinion, therefore, will accept the Board's decision that such reductions as are now ordered are necessary unless a clear case of error or injustice is established.

On their part, the workers assert that the cost of living has not been reduced in any such measure as to compensate for the proposed reduction. For instance, the Executive Council of the maintenance-of-way workers says that the slash in pay for their men is a little over 13 per cent, while the workers' cost of living has not declined more than 3 per cent; but the last figure is certainly not consonant with most economic statistics. Probably, however, the real opposition to this reduction comes, first, from the general reluctance of any workers to receive less pay; secondly, to the fact that those now subject to reduction are the lowest-paid classes of railway workers, because their labor is less skilled than that of the engineers, conductors, and others. Moreover, the men concerned with the maintenance of way, and in less degree those working in the shops, are difficult to organize, because their places can be comparatively easily filled. As a matter of fact, these two unions are of comparatively recent organization. Every one will remember when, not so many years ago, the lowest-paid men used to complain that Mr. Gompers and the Federation leaders always said in effect, "If you want better pay, organize."—Now they have organized; but it is an open question whether the great Brotherhoods of the more skilled employees will sustain them in their resistance.

Railway officials are reported in the press to characterize the threatened strike as pure bluff. A statement signed by several railway presidents says, "Men in the railroad service work under more favorable conditions than in outside shops and industries, and no other men doing the same class of work have better homes or surroundings." On the other hand, the leaders of the men state that the new rates proposed are totally inadequate to allow a man to live decently and support a family. The new schedule would give a maintenance-of-way man from \$11.04 to \$16.80 for six days' work of eight hours each; while the shop workers would receive from \$25.92 to \$33.60 for the same number of days and hours; in both cases the pay would vary in accordance with the nature of the work done.

WHAT DO WE KNOW OF HENRY FORD'S GREAT-GRANDSON?

WHEN Henry Ford offered to take over the vast water power and nitrate manufacturing project at Muscle Shoals, Alabama, agreeing to produce,

SPECIAL COMMITTEE TO CONSIDER THE FORD MUSCLE SHOALS OFFER

Left to right: J. W. Worthington, Washington representative for Henry Ford; W. B. Mayo, Ford's chief engineer; Congressman Wright, of Georgia; Congressman Morin, of Pennsylvania; Congressman Miller, of Washington; Chief Clerk of the sessions (standing); Congressman Fisher, of Tennessee; Congressman Crago, of Pennsylvania

sell, and distribute commercial fertilizers in consideration of the acceptance of the offer by the United States Government, the farmers of the country showed unmistakably that they were overwhelmingly in favor of Mr. Ford's plan. They believe that the man who built the flivver at such a price that almost any farmer can own one, the man who built the small tractor which solved for thousands of farmers the question of power on the farm, the man who has taken over a railway and made it profitable at reduced rates, is the man to provide them with fertilizer. There is no doubt that the great majority of farmers in this country trust Henry Ford.

It is in response undoubtedly to this powerful public opinion that the Military Committee of the House of Representatives has virtually recommended to the House the adoption, in a somewhat modified form, of Mr. Ford's offer.

On the technical matters involved the public is not competent to form an opinion. Whether commercial fertilizers can be produced at Muscle Shoals under conditions that will bring about appreciable reduction to the cost of farming, whether the enormous power generated at Muscle Shoals can be used for that purpose to the best advantage or whether it should be employed in other ways, whether the price which Mr. Ford offers to pay is adequate for the property which he acquires—all these questions and others like them can be answered properly only by those who are in full possession of all the facts and are equipped with the technical knowledge to understand them. There is, however, a question which is involved in this offer that is distinctly within the competence of the public to decide.

According to Mr. Ford's offer, this enormous water power is to be handed over to Mr. Ford and his successors for a hundred years. If this is done, a grave exception will be made to the policy which after long debate has become, or is supposed to have become, the settled policy of the National Government. The Nation's resources belong to the Nation. They belong, not merely to the present

generation, but to future generations. They are the heritage which we of to-day hold in trust for our children and our children's children. They are not to be tied up and kept from use, neither are they to be squandered or to be allowed to pass from the Nation's control. Water power is one of the most valuable of these resources. More and more it will do the work of the world. In its discretion, the present generation can and ought to exercise the right of leasing water power to those who can develop it and use it for the public benefit at a price which will seem fair both to the user and to the public. But the lease of such power ought not to go beyond the life of the generation that makes the lease. At the outside, the period of such leases should not exceed fifty years. Indeed, such a period allows some encroachment upon the liberty of the succeeding generation. The present generation knows and trusts Henry Ford; but what does the present generation know about Henry Ford's great-grandson? Or the great-grandsons of Henry Ford's partners? Or the great-grandsons of Henry Ford's successors? What do we of to-day know about what our great-grandsons will think of Henry Ford's great-grandsons? No one, not even Henry Ford, should have the right to determine the disposal of that vast water power for a hundred years to come.

STILL LOOKING FOR THAT IMAGINARY RABBIT

THE Bonus Bill has been formally introduced in the Senate, and it has brought forth renewed assurances from the President that a Bonus Bill which does not provide for raising the funds necessary to make the payments called for does not satisfy him.

The Senate Committee which introduced the bill seems still to be hypnotized with the hope that it can draw rabbits from its hat without first providing for the insertion of the rabbits. The President is emphatically right in adhering to his opinion that imaginary rabbits will neither serve to pay political debts

nor be of any value to the veterans of the war.

The Congressmen who hope to secure re-election on the basis of their present bonus efforts should bear in mind the fact that it is always more disappointing to be paid with a bogus check than not to be paid at all.

JUSTICE FOR PERIODICALS

WE recently called attention to the fact that a combined effort is now being made by publishers of newspapers, magazines, and other periodicals to secure a partial reduction in the oppressive war rates involved in the present zone postage on second-class mail matter. A bill to accomplish this has now been introduced into the House by Representative Kelly, of Pennsylvania. It has been referred to the appropriate committee, and presumably will come up for action soon.

What is asked for is a simple act of justice and equity. Under the war legislation of 1917, the zone plan, as such, bore unevenly and unfairly upon periodicals which aim to disseminate information and good reading matter all over the country. The rates imposed, apart from the zone inequity, were so high as to handicap the basic idea of second-class rates. That idea always has been a recognition of the fact that there is something more than mere commerce in the issue and circulation of newspapers and magazines; that it is a function of government to help the common people everywhere to get in this way education, information, and even entertainment. An effort was made to soften the blow by dividing the total increase and raising the rates once every year for four years. The highest rate was reached some time ago and is now continuing. The proposal now is to retain the zone system, but to reduce the rates from the present highest level, which went into effect July 1, 1921, to the second advance in rates, which went into effect July 1, 1919.

In introducing this bill Congressman Kelly pointed out that the rates asked for would still give the Government 175 per cent more than the pre-war rates and would not relieve the publishing industry of one cent of the other Federal taxes paid by it in common with other industries.

The present second-class rates are no less than 325 per cent higher than they were before the war. It is stated that every other special war tax included in the War Revenue Act of 1917 has been modified or repealed. The war-time increases on second-class matter alone of that war legislation remain unchanged. It is asserted on statistical proof that these increases have driven millions of pounds of second-class matter from the

tion.

The facts speak for themselves. The
action proposed should have the support
of the public at large, for the public is
most clearly and positively an interested
party.

A NEW RECORD FOR CLIMBING

A RECENT despatch from General Bruce,
in command of the party that is
attacking Mount Everest in the Him-
alayas, states that three members of the
Everest expedition—Mallory, Somerville,
and Norton—on May 21 reached an alti-
tude of 26,800 feet, the highest attained
on the earth's surface by man, and just
2,200 feet below the summit. English
papers state that this feat was accomp-
lished without the aid of oxygen, and
the London "Times" comments, "The
prospect of reaching the summit seems
now much less a forlorn hope than it
did." The record may be compared with
the airplane altitude record, 40,500 feet.

The attack on the highest mountain
on the earth's surface is to be pushed
by a series of efforts, in each of which
the object is to make some gain, estab-
lish a shelter, leave stores, and recon-
noiter the remaining ground. The plan
has a likeness to the attempts to reach
the North Pole; successive parties will
be pushed on, and, sooner or later, it is
hoped that a chance for the final dash
may open. The chief obstacle has been
regarded as the difficulty of breathing;
experts have said that oxygen (carried,
of course, in small portable tanks)
should be used above 22,000 feet; yet the
three men named seem to have gone

without it up to 26,800. It has been
thought probable that the last dash
might well be made by one man strong
enough to carry three or four bottles of
oxygen, enough to last him for perhaps
1,000 feet and back to a camp advanced
that distance from the top.

The utilitarian may ask what thing of
value will be attained by the conquest of
Mount Everest. The answer is that
there is something in the spirit of man
that urges him to attain the all but un-
attainable, and that it is this, more than
personal gain and ambition or specific
immediate results, that animates dis-
coverers, pioneers, and inventors.

COME ONE, COME ALL

TWO years ago, when Resolute and
Shamrock IV retired to a safe
anchorage in the face of a twenty-five-
mile breeze, sarcastic seamen suggested
hat the next Anglo-American yacht races
sshould be sailed with toy boats on the
lake in Central Park. These critics of
our modern racing machines were more
prophetic than they knew. An Anglo-
American race has just been sailed be-
tween model yachts, though the contest-
ants chose Long Island Sound for their
regatta rather than the safer seclusion
of metropolitan waterways.

Apparently English model yachtsmen
are to have no better fortune on this
side of the water than those who have
sought to carry America's cup back to
the British Isles. The British champion
Endeavor was defeated by the American
defender Polka Dot in three straight
races.

These model yachts are by no means

the toys which they may appear to some
to be. They are constructed with amaz-
ing skill and with all the minute regard
for details of displacement, wetted sur-
face, and sail area which animates the
minds of designers of practicable ves-
sels. Victory depends both upon their
design and the skill with which they
are handled. The miniature yachts must
in their contest obey all the rules of the
road which govern their larger sisters of
the sea.

In several cities and towns there are
enthusiastic clubs of model yachtsmen,
the members of which build their yachts
entire or buy the material for them in
various degrees of completeness. The
sport is an entrancing one and richly
deserves a greater popularity and a fur-
ther development.

GUARD THE EN-
TRANCE, BUT LEAVE
THE EXIT OPEN

LAST week we printed special cor-
respondence from Washington by
Newton Fuessle describing the re-
volt of responsible officials, with high
standards of executive efficiency, against
the system which keeps inefficient em-
ployees of the Government in place and
interferes with the work of efficient em-
ployees. It is not merely the spoilsman
who finds fault with the present opera-
tions of the Civil Service. Of course
a party manager who wants to get places
for party workers objects very strongly
to any regulations which keep those

places filled with people who have done no party service. His objections to Civil Service regulations may be properly ignored. Indeed, as Theodore Roosevelt said in his autobiography, "Patronage does not really help a party. It helps the bosses to get control of the machinery of the party, . . . but it does not help the party." The public service is not maintained for the sake of rewarding party workers. Cleveland's famous saying that public office is a public trust has become a doctrine too widely accepted for the spoilsman to nullify. The spoilsman can have no hope of weakening the widespread belief in that truth. What constitutes the evil against which high-minded officials protest is that the subordinate places are so hedged about with restrictions that not only is it impossible to get party hacks into them but it is equally impossible to get indifferent workers out of them. And what is even a worse evil, it is impossible to transfer work from overworked clerks to clerks that are idle.

The defect of the Civil Service system, devised for the public good, is thus twofold, and the remedy must be twofold. In the first place, provision should be made by law which will enable temporary transfers of subordinates from one department, or bureau, or office to another, so that when a special rush of work comes in one place it may be met by supplying from elsewhere some kind of reserve. In the second place, while maintaining all the safeguards necessary to secure a competent worker for every position, the law should give the greatest freedom to those in authority to dismiss from any place a worker whose work for any reason is, to that responsible official, unsatisfactory. There is no reason why public office should be a place of refuge for the inefficient or the indolent. There is no reason why the subordinate in a public position should be permitted to remain in office if incapable of co-operating with those in authority. Rules concerning the appointment to office may be too rigid. In some cases the mechanical requirement that the person who stands highest in passing an examination should be appointed works badly. The appointing power should have some choice among those who have proved themselves eligible. The important thing, however, is that the official responsible for the conduct of his department or bureau should, after giving in writing the reasons for his action, be free to discharge those who he has reason to believe are incompetent or shirk their work. The abuses that may arise under the exercise of such liberty are not as great as the abuses that have grown up under a hard

and fast system that keeps laggard or incompetent workers in places where they are supposed to serve the public. At present, it is frequently necessary to prove against a subordinate misconduct amounting to a misdemeanor in order to secure removal. No private organization could carry on its business on a basis like that. A Government clerk ought to have some other qualifications for remaining in office than merely innocence of crime. There should be a new reform in the Civil Service—a reform in the direction of competent and economic work. The public not only has the right to make sure by law that its servants are not employed for political purposes, but it also has the right to make sure that its servants really serve.

WHY THE PRESIDENT IS WATCHED

UPON every President bears the pressure of party factions. The factions do not need to be in open warfare. They do not even need to realize their own existence to make this pressure a fact. When the President is a dominating personality, his power of selection may be greater than the pressure of the various groups surrounding him. When a President is a team-worker, a man who subordinates his own personality to the power of his Administration as a whole, the question of factional influence becomes of increasing interest to the country at large.

In the long run, it is upon team-workers that the Nation must depend for carrying on its Government. It is therefore no disparagement of this type of mind to say that the country should concern itself with the influence of the men who surround the team-worker in public office.

The Taft Administration was wrecked because of the fact that the Old Guard gained the upper hand in the struggle for personal contact with the President. Signs are not wanting that this same struggle is under way for the ear of President Harding. The warring elements are present in his own Cabinet; on the one side represented by such men as Hoover, Hughes, and Mellon; on the other side by such men as Daugherty and Fall. The recent Republican primaries—in Indiana, Pennsylvania, and Iowa—are indication enough as to the direction to which the country hopes the President will turn. If it were not for the record of 1912 and 1916, we should say that the warning was clear enough for even an Old Guard politician to understand; but there are some who never learn.

THE BAD OLD DAYS

THE pessimists who forever lament the good old days rarely stop to make comparisons. Was civic virtue, for instance, finer or civic corruption less offensive in New York City a third of a century ago than it is to-day? A vivid reminder of just what kind of people were governing the metropolis in 1890 cropped up the other day in an article about Mr. E. L. Godkin's journalistic fight against Tammany. Tweed and his gang were gone; Croker was Boss. (Mr. Godkin, if he were living to-day, would lift eyebrows at some of the eulogies of Croker's honesty that followed his death.) There was talk of a New Tammany, to be clean and virtuous. Hugh Grant was Mayor, and "Harper's Weekly," which had helped drive Tweed to jail, called Grant remarkable for personal honesty and trustworthiness. But Godkin didn't believe in a virtuous Tammany. He wrote: "The society is simply an organization of clever adventurers, most of them in some degree criminal, for the control of the ignorant and vicious vote of the city is an attack upon the property of the taxpayers." A sweeping indictment, this!

To prove his accusation Godkin published nine newspaper columns of biography about Tammany leaders; here is his statistical summary of its executive committee:

Professional politicians, 27; convicted murderer, 1; acquitted of murder, 1; convicted of felonious assault, 1; professional gamblers, 4; former dive-keepers, 5; liquor dealers, 4; former liquor dealers, 5; sons of liquor dealers, 3; former pugilists, 3; former toughs, 4; members of Tweed gang, 6; office-holders, 17.

Of the Tammany Committee on Organization (which numbered 1,070) Godkin asserted that 161 were rum-sellers, 133 were criminal rum-sellers (that is, they kept open on Sunday and after hours), and 235 were without occupation or not listed in the city directory—and Godkin pointed out that professional gamblers were usually without assigned occupation.

One would expect that dire penalties would have followed such an onslaught, for names were freely given, but while libel suits were brought they were not pressed. The uproar was great, the result was nil. Godkin, says Mr. Allan Nevins, who wrote the article from which we quote, compared the inquiry with the introduction of a ferret into a cellar. You knew the rats were there, but until the ferret appeared you did not know where. "When they become aware of his presence, out they scuttle, from the coal hole, the ash-barrel, the

garbage can, the woodpile, brown and black, big and little, squealing and showing their teeth." The three things a Tammany leader most dreaded, Godkin said, were, in the order of their repul-

siveness—biography, honest industry, and the penitentiary.

We are not particularly proud of our Tammany-governed New York of to-day, but when we look back to 1890 and re-

member that reformers enough couldn't be rallied that year to defeat the Tammany thus depicted we may admit that the bad new times are at least better than the bad old times.

RUSSIA AT GENOA

EDITORIAL CORRESPONDENCE FROM EUROPE

BY ELBERT FRANCIS BALDWIN

BOLSHEVISM is the negation of civilization.

In order to put the Bolshevist system into practice, its promoters (who have all the arms though they represent less than one per cent of the actual Russian population of about 130,000,000 now that Finland, Poland, and the Baltic States have been lopped off) have massacred the Imperial family and some two million nobles and *bourgeois* and have confiscated their estates and belongings. The Bolsheviks have also looted the Russian Church. In place of the old courts of law they have instituted their secret Tcheka, a reign of terror. They have suppressed liberty of assembly, of elections, of the press. They have checked industry and transportation. They have oppressed the farmers and peasants by forced requisitions of crops until these people have been sowing the least amount of grain possible and are hiding the results of their harvests. Instead of being an economic self-sufficiency and furnishing much of Europe with grain besides, Russia is now suffering from famine and her people are perishing by the million. Those remaining have lost their power of resistance through starvation and misery.

So much for Russia. But there is something in the Bolshevist system for other countries also to be taken into consideration. The Bolsheviks have used their resources, not only for massacre, for theft, for oppression at home; they have also used their resources for propaganda abroad. In America, for instance, there are, according to Mr. Gompers, President of the American Federation of Labor, a thousand Bolshevist propagandists, whose aim is to destroy the Federation and put a Red dictatorship in its place. These propagandists are also openly opposed to all our social and political institutions.

In other countries we see something of the same thing. But emphatically in Germany and in Turkey we note an amazing success for the Bolsheviks. They have concluded alliances with the Berlin and Angora Governments. Hence the world is now threatened with a Germano-Turco-Bolshevist *bloc*, a menacing mass bringing doom to civilization. The *bloc* has already begun to move against French interests in Syria and English interests in Mesopotamia, with the inevitable repercussions along these

A cartoonist of the Italian humorous journal "Satyricon" made this portrait of Lloyd George as he appeared at the Genoa Conference.

"In the first place, Lloyd George is a stockier, sturdier, more closely knit person than I had supposed. My idea of him had of course been influenced by the caricatures in the illustrated press, where his hair is always too long and curly, his mustache too stubby, his eyes too watery, and his expression too all-things-to-all-men. As I spoke with him, I saw no very long, flowing locks, no bristling mustache, and eyes, not watery, but clear, sharp, shrewd eyes, looking at me with what you might call 'pondered assurance,' and 'eating me up,' as we used to say at school."

This pen portrait of Lloyd George is taken from an interview with the British Premier by Elbert F. Baldwin, editorial correspondent of The Outlook. The interview will be published in next week's issue of The Outlook.

two lines in Egypt and India. The *bloc* represents more than 200,000,000 inhabitants to the east of the Rhine. With Germany at its head, as the intellectual and the directing element, it is the most colossal anarchic instrument of domination which has ever threatened the world.

What have been the resources of the Bolshevist Government?

(1) The reserve of the Russian Imperial Bank.

(2) The treasury of the Russian Church.

(3) The gold reserve of the Bank of Rumania, together with the securities and jewels which had been sent to Russia before the Revolution there for safer keeping.

(4) The properties stolen from private persons and companies in Russia.

(5) The taxes and requisitions imposed on the people.

(6) The trillions of paper rubles put forth. This industry seems to have been the only really Bolshevist industry since the Revolution.

From all the foregoing the Bolshevist Government has had, I estimate, some 4,000,000,000 gold francs, or about \$800,000,000.

At first we were told that Bolshevism could last but a few months in Russia. It has lasted five years. But now the Bolsheviks are at the end of their tether.

Hence they stretch forth their bloody hands in invitation to the hated capitalists to return to Russia.

But, no matter what the Bolsheviks pretend, the Russians have really nothing to sell abroad. So, in order to keep going, the Bolsheviks must have a loan. What impudence! They are asking it from nations to which Russia owes money.

Before the war France, Russia's principal creditor, lent to the Imperial Government, to the municipalities, and to various Russian railway, banking, mining, and industrial companies about 19,000,000,000 gold francs. During the war and before the Revolution France lent to Russia a much smaller but still goodly sum.

In the period before the war and during the all too short period of the Provisional Republican Government, Russia was fairly prosperous. But now the Bolsheviks have destroyed all her riches.

They have even used up all Russian credit. This little group of crazy and criminal men have ruined Russia.

Bolshevism was born of the lowest Jew and Slav temperaments. (The Jewish part of this combination has not the slightest thing in common with the character of the excellent Hebrew citizens of America and other countries.) The solution of any questions is thus all the

more difficult when outsiders have to do with such a combination.

Here at Genoa the Bolshevik delegation sought to "save face" against their return to Moscow.

They wanted two things: (1) To return with their hands full of money, borrowed from the capitalist states represented here; but (2) to return with their voices still loudly proclaiming the triumph of Bolshevik "principles."

The other day the blunt Krassin, the chief "business man" among the Bolsheviks here, as Tchitcherin is the chief diplomat, said to some of us: "Why are we Russians here? The answer may be expressed in three words: *We want money. Let me repeat. We want money. We want money, first, last, and all the time.*"

Of course no civilized government could ask its taxpayers to consent to a loan to these bankrupt revolutionaries, especially as Russia has already "bled" some millions of French, Belgian, British, and Italian citizens in getting money from them. Mr. Lloyd George told us that in no case could the Governments of Europe consent to such credits, both because of the lack of character of the borrowers and because of the already outrageously overtaxed contributors.

Then the Bolshevik delegation thought to obtain a loan through the medium of the banks of various countries. The borrowers had the sublime assurance to ask for a billion-dollar loan. In exchange they offered to recognize the pre-war debts, but they would not recognize the entire right of the foreigners who had been engaged in manufacturing and mining in Russia to their former properties. In my opinion, the banks would throw a billion dollars out of the window rather than lend that amount without something better in return.

What, then, were the guaranties, which the Conference of Genoa asked in return for anything it might do to help the economic reconstruction of Russia? Of course for such a reconstruction there must be not only recognition of previous debts, but also of the entire right of private property. The Bolshevik delegation declared, however, that it could not accept the latter condition in its entirety, because it would subvert the sovereignty of the Soviet Republic. Yet in the Treaty of Brest-Litovsk (1918) with Germany we read that the expropriated properties of German citizens shall be restored. Why do the Bolsheviks refuse in 1922 that which they accorded in 1918? Germany evidently began to be "the most favored nation" four years before the Russo-German treaty of 1922.

Russia needs Europe very much more than Europe needs Russia—indeed, Europe could get on perfectly well without any Russia at all. Russia needs capital now, and a lot of it. Europe could give it, not in loans, as the Bolsheviks have requested, but by means of a commercial international consortium, or the extension by the Powers, acting together, to

Russia of their system of credits, aiding the Russian industrial organizations. In this way a large amount of credit would turn towards Russia. Of course the immediate profits from the working of the consortium would be but a fraction of the huge sum demanded by the Bolshevik delegation.

To meet that delegation's pretensions it is not the proper course to make conciliatory propositions only. To blaze the trail towards the economic restoration of Europe there is only one course—an intimate co-operation, if not an alliance, among the nations of Europe who won the war. It is absolutely essential to save the Entente as an aggressive force. Then, and then only, shall we see Russia and Germany resign themselves to a final comprehension that, after all, their veritable interests do not lie in resistance.

The stoutest member of the Entente turns out to be one of the smallest—Belgium. In 1914 this brave little nation categorically refused to compromise with crime, and now again she has refused to sign the Allied memorandum to Russia which would have legitimized a little—or a good deal—the Bolshevik thefts. M. Jaspar, Belgian Foreign Minister and chief of the Belgian delegation in the Premier's absence, said in my hearing: "Respect for acquired rights is essential to the development of international relations. It is a principle of justice and order without which no spirit of confidence can be established. And on a spirit of confidence the resurrection of Europe depends." So M. Jaspar's resolution before the Conference proclaimed that all the Powers represented here should engage to hold as naught every concession of property of which the former owners had been dispossessed without their consent. The English proposal was to the effect that the Russian Government should restore the foreign properties or indemnify for damages. Alone among all the states represented here Belgium protested. Finally she obtained this addition: "Restore foreign properties or, *in default*, indemnify." It is instructive now to note that the Bolsheviks are declaring themselves disposed to restore ninety per cent of the confiscated properties.

Once the right of private property is recognized, the right of entire individual liberty will follow. Then will come political emancipation. That is what the Conference of Genoa tried to do for the Russian people.

The effort of the promoters of this Conference has been directed towards the conclusion of a general agreement with the Bolsheviks, in which agreement should be stated the conditions under which the countries of Europe would take part in the endeavor to reconstruct Russia.

Through a memorandum presented to them, the Bolsheviks knew just what these conditions would be. When the Russian reply came, its tone surprised only those who did not realize that, ac-

customed as they are to Oriental ways, the Bolsheviks were proceeding on the theory that the foreign nations asked a great deal more than they expected to receive. Hence the Bolsheviks thought that they could keep up a continual bargaining. The reply was a bitter, costly, but practical lesson to the Conference concerning the danger of trying to treat with the Bolsheviks at all.

Really, the Bolshevik delegation did want to come to some arrangement with Europe. MM. Tchitcherin, Krassin, Litvinov, and the rest did not want to go back to Moscow only to have their heads cut off. On the other hand, they did not want to accept the very reasonable conditions offered to them by the Conference because they feared the revenge of the same extremists who would be apt to cut off their heads in the other case. Should they accept the conditions, their Government would lose some of its power. Will they sacrifice to a continuance of all that power the reconstruction of their country?

Russian-American relations did not enter into this Conference. There are no legal obstacles to American trade with Russia. There are plenty of others, however, and they are due, as our Government says, to the domination of certain elements in the Bolshevik Government. Of course no credit can be given to Russia until a base for it has been created—a credit is a consequence, and not a condition. The creation of credits must take place in Russia itself. In the same way political recognition can never take place until a healthy, moral, solid base for international relations shall have been established. This depends on the existence of a government capable of honoring its international obligations and having given proof of the same. It goes without saying that the Bolshevik Government will also have to give proof for a considerable period of time of the re-establishment of freedom and order in Russia before the American Government will dream of recognizing it.

Pessimists here will tell you that so far for Russia the only great and positive results of the visit of the Bolshevik delegation to Italy have been (1) the signing at Rapallo of the Russo-German treaty, concluded at Berlin, and (2) the concord between Russia and the Holy See. If this be so, Russia certainly has gained two immense forces—the technical organization of the Germans and the favor of the Roman Catholic Church. The aim of that Church—the union of Christianity—is noble. But the Bolshevik aim in concluding a concord with her is ignoble. The Bolshevik aim is to fight the Russian Orthodox Church, to-day the only guardian of the traditions of the past; she is indeed a souvenir of "Holy Russia." To fight her the Bolsheviks must bring in one or more other religions. The Bolsheviks must break up the one great faith which has spread all over Russia among as many faiths as possible. They want to do this so as to dominate the Russians more easily, to

divide them into cliques and groups and so to control them entirely. Their ultimate aim is by no means to Christianize, but to dechristianize Russia.

The other day one of their tribunals summoned the Russian Orthodox Patriarch Tikhon before it. The President of the Tribunal asked:

"Who are under your authority?"

To which Monsignor Tikhon replied: "The faithful of all Russia."

Question. "Do you administer all the churches?"

Reply. "Naturally, all the churches are under my authority."

Question. "And the treasures of the churches also?"

Reply. "Yes, I also control the treasures of the churches."

Question. "Do you not know that the pretended treasures of the Church now constitute the property of the State?"

Reply. "Yes."

Question. "You administer, then, a property which does not belong to you?"

Reply. "That signifies nothing. The

Pope of Rome, you will say, also reigns over an empire which has no material existence. On the other hand, the property of the Church is material; it can be stolen."

Question. "Who has stolen anything from you?"

Reply. "It is not from me that one has stolen; it is from the Church, it is from God."

Question. "Who has stolen?"

Reply. "You well know; the Soviet Government."

KNOLL PAPERS

BY LYMAN ABBOTT

TO A MOTHER

YOU have asked me to give you some suggestions which may help you in teaching your child the Bible. This letter is written in reply to that request.

The Bible is not a book, it is a library. It is composed of sixty-six different books, written by at least forty or fifty different writers. Over a thousand years elapsed between the writing of the first and the last of these books. They were gathered together by a process of natural selection out of a considerably larger number. The Church did not gather them, though it put its approval on the gathering which usage had made. This library contains a great variety of literature: legend, myth, folk-lore, fiction, drama, epic poetry, lyric poetry, practical ethics, oratory—written and spoken, essays, biography, letters, dream literature. Let me put this composite character of the Bible before you a little more clearly, in the main following an admirable statement given seven years ago to an audience in the Bedford Branch of the Brooklyn Y. M. C. A. by Dr. S. Parkes Cadman.

Genesis is a book of prehistoric beginnings, stories of the old world rewritten by an unknown prophet; Exodus narrates the birth of a nation; Leviticus, Numbers, and Deuteronomy give its laws, ecclesiastical and civil; Joshua and Judges, its colonial history; Samuel, Kings, Chronicles, Ezra, and Nehemiah, its later history down to the time of the return of Israel from the Exile; Ruth is an exquisite love story of primitive life; Esther, a historical romance of the Exile; Job, an "Epic of the Inner Life;" the Psalms, a book of religious lyrics analogous to our church hymn-books; Proverbs and Ecclesiastes are prudential and ethical counsels gathered from experience and observation; the Song of Songs is a love drama in which the supremacy of love over ambition reaches its splendidly simple conclusion, "Love is strong as death;" the Prophets are writings preserved to us from counsels given to kings and to people by teachers who

were both statesmen and preachers; the Gospels are four biographical reminiscences of the life and teachings of Jesus; Acts is a record of the early life of the Church; the Epistles are letters of counsel to the various churches adapted to their several needs; and, finally, Revelation is a piece of dream literature in its gorgeous imagery unsurpassed by that of either Milton or Dante.

There are two peculiarities about this collection which the reader is likely to overlook, but which are striking if he realizes that it is a national library and that the authors were men of different temperaments and training, wrote in at least two different languages, and in different epochs and without any conscious unity of purpose. It contains no science or art and very little that can properly be called philosophy; and it is all of it religious literature—that is, it is all written by authors who were interested in men's moral relation to each other and in their spiritual relation to God. It is this extraordinary spiritual unity which makes the library appear like a book. All its various books were written by men who believed in God, or at least in the divine life, and wrote to tell their readers their religious experience. It is not an infallible book *about* religion; it is a library *of* religion—that is, of religious experience. Indeed, a really infallible book is inconceivable, for the simple reason that language is not an infallible method of communicating ideas.

In introducing your child to the study of this library recognize frankly that it contains different types of literature. Recognize the difference between fact and truth, and do not forget that fiction is sometimes a better means than fact of communicating truth. If you should read in Greek literature a story of a garden with a talking serpent, a tree of life the fruit of which if eaten would give to the eater the knowledge of good and evil, and a god walking in the garden in the cool of the day, you would not think it history, but fable or para-

ble. Why should you think it to be history because you find it in Hebrew literature? If you read Jotham's parable in the Ninth Chapter of Judges beginning with the statement that "the trees went forth on a time to anoint a king over them," you do not imagine that any such general town-meeting took place in the forest. Why the theological scholars have interpreted the Third Chapter of Genesis as history and the Ninth Chapter of Judges as parable, it is not easy for me, at least, to understand. On the face of it the story of Jonah is a satire on Jewish narrowness and the meaning of it is made clear by the conclusion to which it leads: "Then said the Lord, . . . should I not spare Nineveh, that great city, wherein are more than sixscore thousand persons that cannot discern between their right hand and their left hand; and also much cattle?" But we have forgotten the meaning of the satire while we have turned aside to discuss the question whether there is any fish big enough to swallow a man whole and if he were swallowed how he could compose a psalm in the big fish's belly.

I have made but a beginning in writing an article when I should like to write a book. The object of this article is to persuade the mother who is planning to teach her child the Bible to realize herself that it is a library, not a book, that it contains all types of literature which can be made vehicles for moral instruction, that she must not fear to recognize the difference between fact and fiction, that to do this is not skepticism but common sense, that in teaching a child the Bible it is well to begin with Bible stories and not always draw from them a moral, that she must never discourage her child from asking questions and never evade or conceal her convictions in her answers, that she must be true to herself and never forget that for her child to be skeptical about the Bible would do him no such injury as for him to learn to distrust his mother.

STEEDS OF THE

GENERAL
SHERIDAN'S
FAMOUS HORSE
"WINCHESTER"

Winchester, the famous horse that General Sheridan rode in the Civil War, was, after his death, mounted, saddled and equipped as he was ridden by General Sheridan on the day when horse and rider co-operated to save the Union troops in the famous ride from Winchester to Cedar Creek, Virginia. Now the old horse is to be moved from Governor's Island, in New York Harbor, where he has been for several years, to the Smithsonian Institution in Washington, to take his place there among historic relics of first importance. At the ceremony held on the island on June 3, old Grand Army men, some of whom had seen General Sheridan and his horse on the historic day in 1864, gathered to bid a last farewell to their comrade of old days.

The photograph shows the smallest of the balloons just as it was getting under way, with Ralph H. Upson, one of the world's leading balloonist pilots, in charge.

THESE "MODERN SCHOOLS"

BY HUBERT V. CORYELL

WHAT is a "modern school"? Is it a play school? A freak school? A fad? Is it an institution for the sugar-coating of education? Does it play havoc with all the established principles of education? Does it totally abandon the theory that a child's mind needs the discipline of hard work on disagreeable tasks? Does it develop habits of heiter-skelter thinking and impulsive, unordered acting? Does it teach children to believe that they have the right to follow the dictates of their own wills, regardless of the rights of others? Are there a hundred other faults to be laid at its door?

One might almost think so, to hear the anathemas hurled at it by its critics.

Or, on the other hand, is the "modern school" a sort of heaven-sent "last word" in education? Have its "projects" and its "self-expression" methods created utopian education for the young people who are fortunate enough to get into such a school?

One might almost think so, to listen to the paeans of praise sung to it by its advocates.

Where, then, lies the truth?

Not very long ago I was recommending a school of my home city to a friend of mine.

"That's one of those freak schools, isn't it?" he asked. "The children never do any work unless they feel like it. Teachers aren't supposed to correct or punish them for fear of repressing them, and all that sort of thing."

I spent half an hour trying to give him a different idea of that little school. But it was a half-hour wasted. In the end he sent his children to the public school, not because it was nearer to him, not because he could not afford tuition fees, and not because he wanted to be democratic, but because he felt safer in sending his children to a school of the good, solid, substantial type familiar to all of us. And he still looks upon the school that I recommended as a "freak school" where the children "play all the time."

This is an unfortunate misconception of the modern progressive type of school that is all too common among people whose intellectual attainments ought to make them more searching in their examination of things that have such vital potentialities in the lives of our young people. Because enthusiasts bubble over with their delight in the wonderful new kind of education that they have come to know about, calmer people put on an armor of skepticism. Then when the enthusiasts speak of the outstanding features that please them the skeptics take it for granted that the enthusiasts have told the whole story—which they never have done.

"Oh," cries the enthusiast, "you should

see the delightful way in which they teach arithmetic—all by games, you know. My little girl is simply thrilled! How much better than the old way, sitting at our desks endlessly working at those meaningless sums!"

The skeptical listener, very properly convinced in his own mind that no real understanding of arithmetic can be gained without some pretty steady, concentrated drill, is greatly shocked at this attempt to sugar-coat arithmetic. He doesn't realize that the enthusiastic mother has told only one part of the story. He doesn't know that the arithmetic games which have so thrilled the little child all involve, first, a very clear, concrete explanation of the process that is being taught, and, second, an endless amount of real figuring during the course of the game. All this, indeed,

ion. To be sure, a game now and then is pleasant, especially in drill work, where it can be made competitive and rouse keen enthusiasm. But, paradoxical as it may seem, the older pupils of the so-called "play school" are extraordinarily alert mentally as a result of the stimulating nature of their previous training, and, instead of demanding more play, demand more work.

I remember an eighth-grade class which I once taught in a "progressive school" in which the pupils discovered that I was willfully eliminating square root from the course. They came to me in a body and insisted that they learn to do square root, because one of the girls had a cousin in a regular school who was learning square root, and none of these "progressively" trained girls was willing to be left behind. The amusing part of it was that I—like a good many others who are not trained to be arithmetic teachers—had gladly forgotten how to do square root myself. Being only a makeshift arithmetic teacher myself, I went to a real, old-fashioned arithmetic teacher for help. She very kindly wrote out the formula for me, and I presented it to the pupils. They could not understand it, and were not satisfied to go on using it until they could understand it. I went back to my old-fashioned teacher, and found that she did not understand it herself, though she had been teaching it for years! So the pupils and I together dug up all the arithmetic books we could get hold of, and finally found one which made square root perfectly clear and understandable. Then the class was satisfied. But it had been unwilling to be satisfied with anything less than real mastery, because mental activity had come to be a delight to that class, and mental activity to be really delightful must involve total mastery of all subjects encountered. Yet this school was called a "play school" by skeptics who had heard over-enthusiastic mothers praising it to the skies.

Many of the misunderstandings of the "modern school" are due to the acceptance by skeptics of the extravagant, narrow-visioned laudatory descriptions of extreme enthusiasts as accurate pictures of what really goes on in the "modern school." These misunderstandings are intensified by the caustic accounts occasionally forthcoming from rock-ribbed conservatives who visit the "modern schools" for an hour or two and go home utterly disgusted at the seeming helter-skelter disorder of some of the class-rooms. Such visitors know nothing of the purposes that lie back of the seeming disorder, know nothing of the lasting intellectual stimulation that each apparently disorderly child may be getting out of the thing he is doing,

If you are interested in

forthcoming articles
"THE GIRL AND HER MUSCLE"
and
"CHARACTER TYPES OF
CHILDREN"

seems purely incidental, perhaps, to the little child, who recounts to her mother only the delights of the game. But explanation and drill on the fundamental process are there all the same. Moreover, ten to one the next arithmetic period will be devoted to a more formal type of lesson, in which the teacher will check up results and make sure that nothing vital has been skipped. The mother will never hear of this lesson, because it carries with it no thrill to the pupil comparable to the thrill of the game lesson. So the mother proclaims broadcast, in good faith, that her little daughter goes to a school where arithmetic and all the other dry things are made pure delight by the playing of games. And her conservative hearers smile knowingly and conclude that such a "play school" can't be any good.

Nor is this the whole story. The type of lesson just described, which may be very common with little children, is altered decidedly as the children grow older and more mature. The game aspect of the thing is no longer altogether pleasing to the pupils. They know that they are at school to learn, and they insist that the teacher hand things out to them in clean-cut, man-to-man fash-

know nothing of the extremely orderly, quiet periods that may balance the extremely free periods, know nothing of the permanency of impressions on the brain gained through self-directing activities compared with impressions gained through teacher-imposed activities. They see only confusion and apparent disorder; and they say, "This is progressive education; this is the modern school; Heaven deliver us!"

There is one other group of people who help to bring about the present misunderstanding of progressive education. It is the group of blind, shallow, lip-service fetish worshipers whose fetish is the new and the bizarre. Some real progressive will discover the value of some particular device or method, and will lecture somewhere about it. Instantly the unbalanced chasers after the new will snatch at the idea, make it a part of their enraptured patter, and organize a school based on that one idea. The school will instantly be classified by the conservatives as "modern;" and immediately the modern schools of the sanely progressive type will be labeled once more as "dangerous."

Let us see how this works out in actual practice. One of the best recognized progressive methods of teaching history is through pageants and dramatizations. The fad-chasers decide that this is the only proper way to teach history. "Away with dull study!" they cry. "Our children must dramatize!" So they dramatize this and they dramatize that and they dramatize the other thing. And each time that they succeed in getting drama they think that they have succeeded in teaching history. They become sure that they are doing a wonderful bit of progressive teaching. They decide that the world must know about it. So they plan a dramatization still more elaborate than any yet conceived, and they invite patrons and possible patrons to come and witness it. Then suddenly they become superconscious of the crudeness of the thing that they have been planning. They decide to polish it. They call for more rehearsals than have seemed necessary before. They practice for weeks beforehand, knocking the systematic schedule of study (if there be any) galley-west, yanking children out of recitations here and study periods there in order to get the *ensembles*, drilling star pupils on long parts, while the less brilliant ones stand for accumulating hours as supernumeraries who often don't even know what they are supposed to represent until they are sent home with orders to get such and such a costume. Finally, the play is presented with a grand burst of glory which hides the endless number of individual strains and worries of teachers and pupils. The devotees of "Education by the Dramatic Method" preen themselves complacently, while the skeptics, who can't help but have an inkling of the facts, wonder dubiously if the game was worth the candle. "What did the children get out of it?"

they ask. "Nothing but nervous tension and a few meaningless pictures. Give us the good old-fashioned text-book. Away with these dramatizations!"

As a consequence of this, when some sanely progressive teacher, discovering a dramatic possibility in the day's lesson, lets the class work up a crude, spontaneous little drama on the spur of the moment, with every child at work creating his or her own part and devising his or her own costume and properties, the whole thing occupying a few of their own lesson periods and not disturbing other classes at all, the same skeptics, sickened by the other type of painfully worked up play, shake their heads and say: "More tommy-rot dramatizations. Why can't that school get down to brass tacks and do a little real work?" They have no conception of how hard those individual children have worked in their creative enthusiasm. They don't know of the histories and biographies and encyclopædias pored over with eyes that by reason of the enthusiasm make permanent records on the supersensitized brain-stuff. They haven't the faintest idea of the training in research that has come as a mere incidental to the preparation of that crudely presented little drama. So the truly progressive bit of education is scoffed at by the conservative, who has his mind soured by the monkey-like mummery of the faddists.

This is just a sample. Every truth of progressive education is similarly distorted by unthinking enthusiasts who mimic the forms without grasping the basic ideas at all. Hence the righteous scorn of the conservatives for the "modern school."

Those who really wish to be just must remember that there are "modern schools" and "modern schools," the one set run cautiously by real educators who admit that they are groping for "the real thing," who admit that they often miss it, who believe that they sometimes attain it, who never allow themselves to be fooled by shallow forms, who endlessly check up by common sense and educational measurements; the other set run by flashy imitators who mimic the form and miss the substance, who talk glibly of their "projects," and their "learning by doing," and their "education through plays and games," and so forth and so on. But because the sane progressives are for the most part too busy to advertise themselves and the mummery is so vociferous, they are all lumped together and looked upon with pity and disdain by the great mass of intelligent but conservative people of this world. To them "progressive education" is a joke at best.

But "progressive education" is not a joke; it is a serious effort on the part of earnest men and women to get at fundamental principles and put them into practice for the benefit of the children of the world, present and future. These experimental workers believe that true education is the arousing of the

powers and faculties of children into vigorous activity, the directing of the resulting enthusiasms into worth-while channels, and the training of the energies into efficient habits of work. They believe that vivid creative experiences burn deep into the brain-stuff and that one creative effort is worth a dozen coldly assigned tasks. They believe that mental and moral discipline comes from wanting so hard to accomplish something that no labor seems too great in bringing it about, and that one hard job completed because of the inner urge is better than a dozen hard jobs done to get marks or escape punishment. They believe that it is the teacher's job to study the inherent nature of children in general for general tendencies by giving them more freedom of choice in the things they study and do, and by observing the nature of their voluntary acts; and to study the particular nature of each individual child, harnessing his impulses and guiding his energies to successful creative accomplishments, which give the only real growth. They believe in less adult restraint and more play for little children; but they also believe in more social responsibility, more self-restraint on the part of the children. They believe that much in the present curriculum has no proper place in the education of most children, not because it is hard but because it simply doesn't fit; that some of it is useless for any children, for the same reason. But they do not wish to tear down; they wish to build up. They are not fanatics, but level-headed experimenters.

The real "modern school" is not a farce, a fad, a fake. It is just what the true advocates claim for it—merely a turning of the face in the direction of truth and a courageous attempt to go forward, expecting to make mistakes, but intending to profit by them, expecting to lose the path now and then, but pledged to come back faithfully to it after each discovery of departure from the true course.

We should support the modern "progressive education" movement with every means at our disposal. But we should remember that some "modern schools" are in the hands of shallow, fad-chasing mummerys, while others are in the hands of sane, forward-looking educators. We should learn to distinguish the real thing from its shadow. We should ignore the ill-founded criticisms of those who have been prejudiced by people who don't know the whole story, and we should equally reject the undue enthusiasms of those who think that the "modern school" has already solved all the problems of education. But let us watch with sympathetic interest the efforts of those who are going forward in modest courage toward the goal long pointed to by the greatest educators and philosophers of the world from Plato down to the present time. These are the real progressives in education, and they are the ones who conduct the real "modern schools."

VARIATIONS OF ATHLETIC TYPES

BY R. TAIT McKENZIE, M.D.

Shows the typical oarsman. Long in the limb, short in the trunk, with finely drawn lines and corresponding closely to the Apoxyomenos of the school of Lysippus, which represented the change in the Greek ideal to a more graceful and slender type

THE attempt to make the human animal conform to an average of height and weight by overfeeding the slender and starving the stout, by driving the fat and resting the thin, or by changing the surroundings of either, is naturally foredoomed to failure.

The variations within the normal are what give diversity and interest to the study of man and his measurements, and Sir Francis Galton, that great anthropologist, truly says: "It is difficult to understand why statisticians commonly limit their inquiry to averages and do not revel in more comprehensive views. Their souls seem as dull to the charm of variety as that of the native of one of our flat English counties,

whose retrospect of Switzerland was that if its mountains could be thrown into its lakes, two nuisances would be got rid of at once."

Nowhere can one find this divergence within the normal so beautifully shown as among athletes, whose type of figure must be adapted to the particular feat in which they excel.

The place of sport and exercise in

This is the finest example of the greyhound type, the figure slender and graceful. This man was a triple champion in the Olympic Games in the standing high jump, for which his long, slender muscles and light bony structure peculiarly fitted him

This photograph of a great guard in football shows the powerful neck and trunk and the short legs that denote great vitality and strength. He is the type represented by the Doryphoros, the early Greek ideal of manly beauty

changing the development of the body has been greatly misunderstood. It is a common belief that football develops large and burly men, that swimming develops fat men, that running makes men's legs long, and that jumping develops human kangaroos. This is, after all, putting the cart before the horse. A man will select naturally such events as will enable him to succeed through the particular structure of his individual body. The wrestler with a short neck, powerful shoulders and body, and great muscular strength has an enormous advantage over a competitor whose long neck lends itself to a good half Nelson. The hurdle runner, who must clear the ten yards between the hurdles in three

Here we see two champions, one a high jumper and the other a heavier of weights. The fine bones of the jumper and the slightness of his frame are unmistakable, while the solid torso, short sturdy legs and neck, and broad shoulders of the shot-putter account for his driving power.

Three champions in putting the shot and throwing the hammer. No training could change the Herculean type of these men and make them sprinters and jumpers. We suspect that not much attention would be paid to those who would be most likely to object to the build of these men. They are star athletes of the New York Police Department.

The fat boy is not debarred from athletics altogether. He may still be a plunger, as every spectator at a swimming meet well knows, but he cannot be changed into the greyhound.

strides, should have a certain height and length of stride if he is to have any chance of success in this particular competition. The hammer-thrower needs height, and the shot-putter has an advantage in being able to place great weight behind the missile. The jumper has, like the greyhound, an advantage whose light, airplane-like skeleton is driven by lithe but powerful muscles.

As far back as the time of Philostratus (B.C. 50) this division of men according to their muscular ability was made, and in this quaint way he divided them into classes according to the animals they most nearly represented, such as the bear, which would remind one of the wrestler; the lion, which would make us think of the football player and boxer; the greyhound, the sprinter; and the stag, the oarsman and perhaps the jumper. In spite of this, however, it is not always easy to choose from the physique alone the type that will succeed in any one form of muscular endeavor. The short legs of a jumper may be more than counterbalanced by a fine power of concentration which sends him over the bar far above his head. William Byrd Page jumped about eight inches over his own height. Sprinters are tall and short, stout and thin, counterbalancing physical defects by unusual intelligence or mental concentration, and it is only where the athlete comes in competition with certain immovable apparatus like the hurdles or implements like the shot and hammers that his type must conform to their requirements. The great athlete, then, is

There is as much individuality in the shape of the muscle as in the expression of the face, and, although a muscle may be developed within its limits, its form cannot be greatly changed. This man was a carpenter by trade, had never taken much exercise, and was no stronger than the average man of his height and weight, in spite of the beautiful muscular development shown in the picture.

perfect after his kind. Even the sprinter, whose range of variation is more than most athletes, is typically a man of five feet nine inches, with a square chest, well-muscled shoulders and torso, legs sturdy though not unusually muscular, with rather light bones, and always a fine power of mental concentration and a short latent period.

Future investigations will undoubtedly be directed toward discovering the ideal types of figure rather than in trying to drag these types up or down to the average, as the case may be.

The statuette the picture of which was published with the announcement of this article in last week's issue is modeled from the measurements of one hundred runners who could cover one hundred yards in ten seconds or less. It may be said to represent the athlete who has been most successful in trials of speed, long-limbed, small-boned, and well muscled.

An average of the fifty strongest men at college would not show a Hercules, but rather a well-developed young man whose proportions would go midway between the two extremes of slenderness and stockiness. Like most scientific investigations, it is disappointing from the spectacular standpoint because the individual peculiarities become obliterated in the mass of statistics.

I believe that Mr. Taylor's plan of classifying individuals according to type rather than according to general averages is much more interesting and much more sound than any plan that has hitherto been devised.

CLEAR THE CHANNELS

BY EDWARD A. FILENE

DIRECTOR, INTERNATIONAL CHAMBER OF COMMERCE

THE channels of international trade are choked. Ships swing idly at their moorings, factories are at a standstill for lack of raw materials, jobless men walk the streets, while between the nations economic barriers kill trade. International traders, with no assurance of what conditions will be on the morrow, do not dare to risk any but spot transactions. Many treaties are made, but few are effectively carried out. The world draws a breath of relief only to find itself still in the chaos of international misunderstandings with little gained. Even in the United States millions are out of work. Minorities are restless and turbulent everywhere, and under democratic forms of government they are proving themselves capable of blocking each effort to restore the free play of amicable international relationship.

Trade cannot flow through channels blocked by exorbitant tariffs, governmental prohibitions, preferential export taxes, monopolistic control of basic raw materials, national attempts to secure or retain "war" industries regardless of economic justification, and all the other barriers to free economic intercourse attendant upon the violent outburst of nationalism in industry since the close of the war.

The commerce of the world has suffered more disastrously from the prevailing uncertainty as to what governments are going to do next in tampering with natural economic conditions than from any other one cause. If one country wants goods and another country can supply them, there is always some way that the trade can be arranged if conditions could only be made stable enough to eliminate the trade-destroying fear of new aggressions—of new wars, economic or military.

The war taught all the world the importance of basic products and key industries, and it is not surprising that the newer and weaker countries of Central Europe should erect economic barriers to control the one and encourage the other. Suspicion and jealousy reign as part of the economic war raging in Europe.

The Baltic states have erected barriers of export taxes, each hoping to prevent the outflow of its raw materials and to encourage the creation of industries within its own borders. The attempt is natural enough where leaders are inexperienced in statecraft and ignorant of economic laws.

What difference does it make, we ask, if Latvia, Esthonia, and Livonia vie with each other in the extent and height of their export tariff walls? They must protect themselves until they discover who are friends and who are enemies in

the countries around them. Naturally they are timid and cautious.

We may note with relief that the Balkan States have already passed through the stage of unrestrained use of export taxes and are modifying their artificial barriers. Czechoslovakia and Bulgaria have reduced or canceled many of the tariffs they imposed two years ago.

This might indicate that the use of these taxes was a passing whim and that finally these newer members of the world's community of nations would recognize generally the experience of the larger European countries in the eighteenth century, when more friction than good resulted from the use of export restrictions.

Export taxes, unlike import duties, throw the obvious burden on the purchaser. In theory as well as in fact the largest proportion of such taxes are paid by the purchasers in the other countries, and so these taxes are, in effect, "taxation without representation." Export taxes were in use extensively a century and a half ago, but bitter experience with the international differences resulting from them caused so strong a revulsion of feeling against them that our forefathers specifically forbade the use of export taxes in our Constitution. The United States, therefore, has never imposed an export tax and has had little experience with this type of control.

The ominous note, however, comes when we learn of the adoption of export taxes by British legislatures for the control of basic raw materials that are needed by all the world. Great Britain had accepted freedom of trade as its commercial policy and was teaching the whole world an amazing lesson in applied economics, prospering wonderfully without artificial trade restrictions.

Suddenly within the past few years the British Dominions have thrown over the whole structure of the Empire's former international policies. Offspring of the nation which has stood out boldly during the past half-century to demonstrate the advantages of free and friendly economic relations are now shutting themselves off from the rest of the world in order to maintain control

of basic commodities and to prevent other nations from getting these commodities without paying toll.

Lloyd George makes treaties in vain when New Zealand and Australia undertake to monopolize the phosphate output of the island of Nauru. Here is a little Pacific island, taken from Germany and given to these Dominions to administer for the Allied and Associated Powers under a mandate. Under German rule its phosphate production was sold freely to all countries of the world; it is one of the largest and richest deposits known, and the product of that little far-away island may become of immense importance as the world's farmers turn more and more to intensive cultivation. Under their present scheme, the British Dominions get all the phosphate production they want at cost price and other nations must stand around, hat in hand, waiting to see if there will be any phosphates left. If there is any surplus over the needs of the British Dominions, the other countries may then be permitted to buy at monopoly prices.

The influence of treaties to maintain peace on the Pacific is lessened when the Malay Peninsula places a prohibitive tax on the tin ore going anywhere except to British ports.

It is excellent to eliminate "sore spots" in China, but this is not enough. When India places a preferential export tax on hides and skins which is calculated to prove a death-blow to the newly established glazed-kid industry in this country, and when West Africa places a preferential export tax on palm kernels at the time when, cut off from her usual supply of vegetable oils, this country was building oil crushers of her own, it is clear that military treaties must be supplemented by some solution of the export-tax evil if international good will and commerce are to rehabilitate the world.

So far, as fast as one obstacle has been laboriously dragged from the channels of trade another has been shoved into the current.

If international distrust and jealousy are to be held in check, every nation must give up the idea of arbitrarily controlling or monopolizing any basic raw materials and must release them freely to all comers on equal terms. Unless discussion of the control of basic raw materials is permitted, economic conferences cannot accomplish the full measure of good expected of them for the restoration of the economic equilibrium of the world. Only careful study and free discussion will disclose the supreme danger threatening the world from this new poison gas of the economic war which is preventing the rehabilitation of our war-torn world.

LUCY FURMAN

will contribute a vivid sketch of the work of a courageous Kentuckian and of his warfare against moonshiners. Her forthcoming article is entitled

"A Right Sheriff"

HOW BIRDS MAY SAVE A BILLION DOLLARS' WORTH OF FOODSTUFFS A YEAR

BY ROBERT H. MOULTON

LOPPING a billion dollars off of the Nation's cost of living by the simple expedient of feeding and protecting our birds sounds a bit fantastical, yet there are economists, grain growers, and others in this country who believe that the scheme is entirely practicable. Authorities who have made a study of the subject say that the conservation of all insect-destroying birds would result in the saving of \$1,000,000,000 worth of grain and other foodstuff that otherwise is lost each year.

When the conservation of bird life is referred to as one of the greatest economic problems with which we have to deal, that statement carries with it proof indisputable that the subject is so great that few have any conception of the extent to which this country would benefit should an attempt to restore nature's balance between the bird and insect worlds become general. There have been any number of years when, it is estimated by competent authorities, a loss of more than \$900,000,000 has been inflicted on the crops of the country by insect pests—a matter of \$8 levied on every person in the United States over and above what would have been necessary had the ravages of these insects not taken place.

Now, nobody interested in the conservation of birds is sanguine enough to believe that this tremendous loss which the Nation suffers annually can be wiped out in a few years. There will never come a time, probably, when codling moths, potato bugs, locusts, and other pests that seem to spring up from nowhere and leave a trail of desolation in their wake will not exist to some extent. We have always had them, and there is little likelihood that they will ever become sufficiently rare to arouse curiosity.

But consider what a change would be wrought, what benefits would result, from the elimination of a fraction of this waste. Even one-quarter of this amount is \$225,000,000, a right tidy sum in this age. And there is no telling how much further the good work could be carried, until with proper attention it might ultimately approximate abolition of the industrious little destroyers that feast on the fat of the land and make the head of every household pay the price of their depredations.

The theory of those who advocate bird conservation is that if birds are present in any given locality in sufficient numbers they will prevent the excessive increase of those insect pests on which they live to a large extent. The number of birds need not be large proportionately, for they have an almost incredible capacity for insects, and, singularly enough, the young birds in the nest are even more ravenous than their elders. Cases are common where birds have

OPEN-AIR "CAFETERIA," BUILT TO HOLD FOOD FOR BIRDS AND ENCOURAGE THEIR PRESENCE

been observed to eat half their weight in worms and insects in the course of a day, and it is a matter of record that a young robin ate nearly twice its weight in cutworms and earthworms and other worms in a like period. Insect birds have been called the "police of the air." Certain species of birds consume millions of mosquitoes and disease-breeding insects that annually collect a toll of death among the cattle. Examination of the stomach of a nighthawk, for instance, revealed five hundred mosquitoes—indicating a tremendous slaughter among the enemies of mankind.

Insects, it is asserted by Government experts, are more numerous than any other known form of life. Caterpillars are shown to eat twice their weight in leaves per day, and it is well to remember in this connection that vegetable feeders of this species during their progress to maturity, which occupies thirty days, increase in size no less than ten thousand times.

Birds are often accused of eating this or that product of cultivation, when an examination of the stomachs shows the accusation to be unfounded. Within certain limits birds eat the kind of food that is most accessible, especially when their natural food is scarce or wanting. Thus they sometimes injure the crops of the farmer who has unintentionally destroyed their natural food in his improvement of swamp or pasture. Most of the damage done by birds and complained of by farmers and fruit growers arises from this very cause. The berry-bearing shrubs and seed-bearing weeds have been cleared away, and the birds

have no resource but to attack the cultivated grain or fruit which has replaced their natural food supply. The great majority of land birds subsist upon insects during the period of nesting and molting, and also feed their young upon them. Many species live almost entirely upon insects, taking vegetable food only when other subsistence fails. It is thus evident that in the course of a year birds destroy an incalculable number of insects, and it is difficult to overestimate the value of their services in restraining the great tide of insect life.

There are a number of common birds, to be found on almost every farm in the country, whose economic value cannot be disputed for an instant, although, unfortunately, many farmers do not realize this. The meadow-lark, for example, is a familiar bird of grassland throughout the whole United States. Alike on Eastern meadows, Western prairies, and Southern savannas, its clear pipe, as sweet and clean as silver, may be heard in spring announcing the return of the season of procreation and growth. More than half the lark's food consists of harmful insects. Its vegetable food is composed of either noxious weeds or waste grain, and the remainder is made up of useful beetles or neutral insects. Assuming that an adult lark destroys fifty grasshoppers a day—a conservative estimate—and that five pairs of larks nest each season on every good-sized farm where they are not persecuted, the number of grasshoppers despatched daily on such a farm during August means a boon the enlightened farmer must appreciate.

Unfortunately for the meadow-lark, its body is plump and its flesh well flavored, and, as it is easily killed, the temptation is too great for some persons to resist. But it is most emphatically a case of "killing the goose that lays the golden eggs." The small portion of food that the creature's body yields is as nothing compared with the good the bird does when alive. The tendency to treat the meadow-lark as a game bird is far too general, and every farmer on whose land it is found should rigidly protect it and allow it to breed undisturbed. When their numbers have so far increased as to render it dangerous to crops it will be soon enough to begin the thinning-out process, but that day is still far distant in most parts of the country.

No bird is better known to country residents than the bob-white. The bird's cheery calls the year around form part of the most pleasant associations of country life, and its neat form and harmonious coloration, and especially its confiding habits, make it a general favorite. Weed seeds form more than half its total food and include those of all the worst weed pests of the farm. Grain

SNOWBIRDS, OR JUNCOS, AND OTHER VALUABLE BIRDS THAT WINTER AROUND FARMS AND CITY HOMES

forms scarcely more than a sixth of this bird's food, but most of it is taken during winter and early spring, when, nothing but waste grain is available. The habit of gleaning this after the harvest is beneficial to the farm, for volunteer grain is not desirable, especially where it serves to maintain certain insect and fungous pests. From June to August, inclusive, when insects are most numerous, their proportion in the food of the bob-white is about forty per cent. The variety of insect food is great and its food also includes a number of the most destructive agricultural pests, among which may be mentioned crab, cockspur, wire and foxtail grasses, sheep sorrel, smartweed, blindweed, pigweed, corn-cockle, chickweed, charlock, beggar's-lice, ragweed, and Spanish needles.

The food habits of the bob-white undoubtedly are beneficial and the bird should be maintained in numbers on every farm. This is not to say that all shooting should be prohibited, for the bird is very prolific. But its numbers should not be reduced below what the available nesting sites and range will support. On the other hand, the policy of absolute protection recently adopted by one of the States is not called for by strictly economic considerations.

The diminutive house wren is a fussy, flighty, and fidgety little midget, frequenting the vicinity of barns and gardens, and particularly old orchards where the trees are partially decayed. Never for a moment at rest while there is a ray of daylight, it would seem that his small body must soon be worn out by his incessant activity. His voice, as tireless as his wings, is heard from morning until night about the garden and orchard where he seeks his daily food, and, while not very melodious, it is cheerful and suggestive of life and activity.

In food habits the wren is entirely beneficial. He may be said to live upon animal food alone, examination of the stomachs of a large number of wrens showing that ninety-eight per cent of the contents was made of harmful insects. As the wren is a prolific breeder, frequently rearing in a season from

twelve to sixteen young, a family of these birds must cause considerable reduction in the number of insects in a garden.

The house wren is only one of a numerous group of small birds of similar habits. There are within the limits of the United States twenty-eight species and sub-species of wrens, occupying more or less completely the whole country from the Atlantic to the Pacific. No species of wren has been accused of harm, and its presence should be encouraged about every farm, ranch, village, or suburban residence.

The junco, or snowbird, may be found over practically the whole country during the winter months. The insect food of the junco is composed almost entirely of harmful species, of which caterpillars form the largest item. Juncos do not damage fruit or grain, but eat large quantities of weed seed, thereby rendering a valuable service to agriculture. The chickadee is another small bird, widely distributed, whose food consists largely of the eggs, pupæ, and larvæ of noxious insects. As an enemy of caterpillars the bird has few peers. It also destroys a great many of those two pests of horticulture, plant lice and scales.

The little screech-owl ranges from coast to coast and far beyond both the

northern and southern boundaries of the United States. With the exception of the burrowing owl, it feeds more extensively on insects than any of the owls. It is also a diligent mouser, and feeds more or less on scorpions and lizards. Among insects, grasshoppers, crickets, beetles, and cutworms are most often eaten. As many as fifty grasshoppers have been found in one stomach, eighteen May beetles in another, and thirteen cutworms in still another. During the warmer parts of the year it is exceptional to find a stomach not filled with insect remains.

Meadow mice, white-footed mice, and house mice are the mammals most often taken. As more than three-fourths of the owl's food consists of injurious mammals and insects, and only about one-seventh of birds (a large proportion of which are destructive English sparrows); there is no question that this little owl should be carefully protected. As a matter of fact, all of our owls are much more useful than injurious, notwithstanding the popular opinion to the contrary. They deserve almost complete protection rather than the persecution to which they are customarily subjected.

An interesting experiment carried on in Illinois during the last two years proves conclusively that many of the migratory birds that annually desert the North for sunnier lands do not travel South because of the climate. Lack of food has starved them out. On a tract of five or six acres near Chicago thousands of supposedly migratory birds have been induced to spend the winter by reason of suet supplied in food-boxes.

The work of feeding the birds at this place resulted in the construction of a special design of food-box. It was discovered that when suet was placed on the ground or the limbs of trees without protection the bigger birds, after the manner of their human kind, crowded out the smaller and weaker birds and took possession of the entire supply. In order to prevent this, a box of special construction was prepared. Its back consists of a curved piece of metal that protects the bark of the tree upon which it is hung. The front is covered with a strong wire net that is sufficiently coarse to admit the bills of the hungry birds, but too fine to allow them to remove all the suet at once.

The result of the feeding is that many birds of species that ordinarily would be unknown in the region of Chicago during the winter months remain in this tract of land, seeming to appreciate the fact that they will be provided for. Others, coming from a more northerly latitude, decide to remain in this realm of plenty until the return of spring sends them back to their summer haunts. This leads to the belief that once a feeding-place has become thoroughly established with the feathered rovers, they will be attracted in sufficient numbers so that they will multiply rapidly, and if left undisturbed will in the course of a few years make a remarkable showing to the benefit of both the country and the suburban dweller.

OWL AND YOUNG ON NEST. THEY KILL MANY MICE AND OTHER ENEMIES OF THE FARMER

THE ROMANCE OF IT

BY W. B. MAXWELL

AUTHOR OF "MRS. THOMPSON," "A LITTLE MORE," AND OTHER NOVELS

I PRICKED my ears to that word "romance," because it sounded so extraordinarily incongruous on the lips of a little dry old fellow in a third-class smoking carriage of a Ramsgate train.

"Yes, I bin through a lot in my time."

"And I dare say seen a lot too," said the fat, stupid-looking man opposite to him.

"Enough to make a book," and the old chap paused to fill and light his pipe.

They had not spoken to each other until the carriage emptied at Faversham, but now they went on talking—or rather, the old man talked and the fat man listened, merely making echoes or approvals now and then, to show interest and sympathy. While pretending to read my magazine I listened also, fascinated, as I always am, by the total lack of reticence and astounded by the strength of the instinct that impels certain people to unbosom themselves to strangers, as if they felt it a duty as well as a pleasure to offer the most secret workings of their hearts and minds as object-lessons for the transient attention of the wide world.

"Sixty-eight years of age I am."

"Shouldn't have given you so much."

"Yes, I am." And I looked at his ruddy, wrinkled cheeks, his small lively eyes, and his scrubby gray beard, while he continued to pour forth biographical details. "Hopkins, my name is. Married twice. Ah, you can smell the briny now, can't you? I've never followed the sea, though connected with it. Dealer in sailors' stores—boots, tarpaulins, what not. Kept my fortieth trade anniversary last year, I did. It isn't a big business. In point o' fact it isn't a great deal bigger now than it was forty year ago. But we've 'ad our bread and cheese out of it all the time."

"You can't complain, then."

"No, I don't complain. I should 'a' done more, p'r'aps, but for deficient education. That was one of my drawbacks. Left schooling too early, to take up my apprenticeship with a grocer in London."

Then soon Mr. Hopkins used that stimulating but unexpected word again.

"There's ordinary marriages, and there's what you may call romantic marriages." As he said this he chuckled complacently. "My first marriage was a romantic marriage, if ever there was one. You know what I mean? All chances—one thing leading to another."

"The first chance was my scraping acquaintance with a man called Brickett. He called himself so; it was not his name really, as the event proved. I was young then, and the meeting took place in a public house at Bournemouth, where

I'd come down from London for my summer holiday.

"Now here's a funny thing—I knew Brickett was a wrong 'un from the moment I saw him. The first word he addressed to me I was on my guard with him. Nevertheless, not knowing any one else in the place, I was satisfied to share his companionship—so far as mouch about with him, sit on the sands and smoke a pipe, and take our glass together at the Red Anchor of an evening—but a bit ashamed of him because of his shabby garments, and careful not to let him cadge on me, and showing I didn't mean to be his victim.

"HE was a very ugly man. I've a reason for telling you that. Second day or so he disclosed how he'd been in trouble, but, having served his sentence, no one could throw it in his face. That's the law of England. Quite right too. Respectable born, according to his tale, but debauched by bad company, and then giving up the struggle. Far as I could make out, his profession, if you can call it so, at the present time—when I say the present time, you understand, I mean at *that* time—was no more than hanger-on, number-runner, or tout, to a pack of book-makers. Where I think his money came was more by a sort of agency—going about among town lads and leading 'em on to bet their bobs and 'alf-crowns day by day with one of his crew. All that game is Greek to me, and always 'as been. I kept meself out of it, and wouldn't mix meself up with it, and, if you ask me, I don't know why the Government hasn't ever stopped it. Beyond this what he let fall, I soon detected that 'e was a man who could show his power over women; and I 'ad my suspicions 'ow 'e'd turned this to account in 'is time. If I admired him for such power as he showed, I 'ad my own private reasons, and you'll understand I didn't respect 'im for it—far from it. Any such suspicion naturally filled me with disgust, and made me the more sure, if I 'adn't been sure already, not to make a *friend* of him. Our intercourse was only two pals in holiday time, and so it must remain. Well, then, noticing the barmaid that served us at the Anchor, I passed the remark to Brickett, so as she couldn't hear me, that she was a fine piece o' goods. And so she was for 'er age, for she must 'ave been forty if she was a day; but what with her dyed hair, and the way she pulled in her figure, and 'er pleasant manner of speech, according to the custom of the trade, quite a picture as she stood there behind the bar cleaning of the glasses in preparation for closing time.

"'Why don't you tell 'er so yourself, straight out?' says Brickett. 'Go on! Tell 'er so.'

"'Not much—not me,' I says. 'I've too much respect for 'er. I'm not going to insult a respectable young woman.' And the idea of it made me quite hot and uncomfortable.

"'Gammon!' says 'e. 'She won't be insulted. She'll take it as a compliment.'

"I told him to drop it. No more chaff of that sort, unless he wanted to see me go straight out of the door. As I said, it was near closing time, and there was only us three there—him, and me, and the barmaid.

"'All right,' he says; and then before my eyes he began on her himself.

"Don't ask me what 'e said. I couldn't tell you if I tried, but there he was, leaning acrost the bar, paying her 'is compliments, all familiar chaff on 'is side and giggling on 'ers, till he asks her, 'What's the price of kisses to-night?' And she says, 'More than you can pay, anyhow.' To which 'e replied, 'Then I'll 'ave one gratis.'

"Did I mention to you that 'e was a very ugly man? It's the fact—something wrong with 'is eyes, and, moreover, there was a scar one side of his face, where 'e'd been kicked by a horse as a child, as 'e said. Notwithstanding, there 'e stood, leaning further and further crost the bar and squinting at her most horrible, and 'er giggling, till all at once she says, 'I suppose I must do it, if I want to get rid of you.' And she give 'im his kiss, free, gratis, and for nothing. It was the evidence of my eyes, or I wouldn't 'ave believed it.

"'Now,' she says, laughing, not a bit offended, 'be off, the pair of you. I never heard of such goings-on. You London gentlemen behave as though you've bought the place. You're a precious pair, so you are. Good-night. And don't let me see you here again.' Saying it, mind you, as though she didn't mean that last bit.

"Brickett and I went out arm in arm, both of us laughing, and, explain it how you will, I felt all excited and stirred up by what had passed, with the sensation that I'd been carrying on just as bad as Brickett. Prob'ly it was 'er way of coupling us together, but there it was! I felt as if I'd kissed 'er meself."

Mr. Hopkins, leaning forward, touched the fat man with the mouthpiece of his pipe, as though to enforce a point.

"Now this bit o' fun with the barmaid you may call the second chance in the romantic events to which I was drifting.

"Before we parted that night, or perhaps it was next day—I don't remember—Brickett and I got started talking

about marriage, and off and on we never stopped. I begun by telling him that I was bashful with women.

"You don't need to be," he said. "They never appreciate it."

"But bit by bit I confessed to him—what was the Gospel truth—that I felt myself too timid by nature ever to reach the point of asking a girl to marry me. Mind you, this was sober earnest, explain it how you will. I'd reached the age of twenty-three, but so timid about it that the matter was what you may term a sealed book. Not that I didn't want to get married—far from it. It wasn't that I couldn't fall in love. For, believe me, ever since I left school I'd been in love with the whole sect. No consequence to me what color a girl's hair, or her eyes either—no, nor her size. There was something to me about a decently dressed young woman, whether I see her behind a counter, wheeling a pram, or sitting about, as they were by hundreds down there, I was fascinated and overcome by it. Look here, not so long ago I read a piece in a newspaper called 'Feminine Charm.' Well, those words, they just hit the target! That was what I felt all the time—feminine charm. Only, if I can make myself clear to you, I couldn't profit by it; tongue-tied, stupid, timid, at the mere notion. This I told to Brickett perfectly honest, as I've told it to you, and we came near a quarrel because of a remark he made on it. But I told him, if I was timid of women, I wasn't timid of men—no—and that was the truth. If I fell out with a man, no matter that he was twice my size, and he generally *was*—for you see what I am in stature—the opposition and heat I felt at once enabled me to stand up to him. I couldn't give in if I wanted to. I'd sooner take a licking any day of the week than be backed down. And I let Brickett understand that precious quick. He apologized.

"SAME evening we went to another public at Brickett's wish, where we could talk quiet without bothering about that barmaid. We was still talking of the same subject, and over our second glass he tells me on his honor that he knows of a girl who would take on any decent chap like me, and gladly too. He said: 'What's more, she's got a nice bit of money, too, that she came into.'

"But who is she?" I asked.

"Never you mind who she is," he said, 'until we get a good deal more forward in what we're arranging.'

"Is she straight?" I asked him.

"What d'ye mean by straight?" was his reply. 'If she gives her word, she won't go back on it.'

"But I explained to him my meaning, that with such a thing as marriage under discussion I wished to know if she was a virtuous young woman.

"He burst out, angry and violent. 'O' course she is,' he shouts. 'And if you attempt any tricks with her, I'll bash your head in.' As a matter of fact, it

was *then*, and not before, that I told him how, if I was timid with one sect, I wasn't with the other.

"Then he answers, dogged, but firm: 'Yes, she's a good honest girl, and always has been.'

"How d'you know?" I asked him. 'Have you yourself tried it on with her?'

"That made him angry again, and he went on to say he'd happened to know her and her family from childhood; she was in domestic service in this very town of Bournemouth, and he'd partly come down to see her.

"Well," I says at last, 'it all sounds very nice, but o' course there's a catch to it somewhere,' and I put it to him: 'Why should she be in such a hurry to take on such a poor sort of bargain as myself? I wasn't handsome, and beyond a decent suit of clothes on my back and a few savings in the bank I hadn't much, as I could see, to recommend me. Brickett then became very confidential. 'It's like this,' he says. 'She's a girl that 'as a keen desire to be engaged and married. To a certain extent it's rivalry—not caring to be left on the shelf and other girls going off one after another—and it's also a kind of instinct. Often I've argued with her, saying: "Miss Shaw"—that's her name—"Miss Shaw, you're far better as you are. A husband, if you get a bad one, will spend your money, put you in a condition you can't go on with your employment, and break your heart." But it makes no difference to her. She's set on it.'

"Well," I says, still doubting, 'she didn't ought to have far to seek to satisfy her aspirations.'

"One thing," says Brickett, extremely confidential, dropping his voice so low that I had to tell him to speak up, 'One thing,' he says again, 'she isn't a beauty. I've not said she is, have I? No, all that family was handsome men and women except her.'

"I didn't understand this illusion till long afterwards. Couldn't do so, not having the clue.

"However, nevertheless and notwithstanding, the following evening he took me up behind a large house among the pine trees towards Boscombe way, and after a bit she comes out and he makes the introduction. She was a fine, big young woman, and dressed as gay as any one could wish to see.

"Miss Shaw," I said, very nervous, but passing it off as well as I could, 'glad to meet you;' but she never answered, only looked at me.

"It's her evening off," says Brickett, 'and she has till ten o'clock. Don't keep her out after ten, 'cause her mistress won't allow it;' and he was for leaving us, but I caught 'im by the coat sleeve.

"Don't leave us, Brickett," I says.

"No," she says, looking at me, not at 'im, and speaking no louder than a whisper, 'you'd better stay.'

"Oh, no," he says, laughing; 'two's company and three's none;' and with that he's gone.

"We two went through a narrer path

among a lot o' bushes, my only idea being to get out to the cliff and p'raps take her down towards the pier and give her a drink and let her listen to the band. But I was in such a state of confusion that I hardly knew what I *did* mean. She stepped along the path in front o' me as I'd told her to, because I truly felt that shy I couldn't look her in the face; yet ashamed too, and wanting to kick myself for it. Same old story—I was overcome by the charm, but struck helpless as usual; my throat all dry, my tongue sticking to the roof of my mouth, speechless. But I struggled, trying to pull myself together, thinking, 'Now, Jack, you're up against it. Don't funk. Be a man for once.'

MR. HOPKINS laughed with enormous relish before continuing.

"I made the vow I'd begin before we got through them bushes, and just as I caught a sight of the stile at the end o' the path I found my courage. I started on her as near as I could in Brickett's way—taking a leaf out of his book when he came over that barmaid—pretending to have full confidence.

"Here I am behind you," I said. 'You haven't lost me yet. Suppose I was to put my arm round your waist. D'you think I could get it round—for you're one o' the substantial sort, aren't you?'

"At what I said she stopped short, not looking back at me, but holding her head down and moving her hands about in a queer way as if she was swimming, and my courage failed me.

"Don't be afraid," I said, laughing, foolish. 'I'm not going to take any such liberty. Only my chaff. I'm a rare one for chaff. Hope you don't mind it, miss?'

"She walked on at once, and we come to the stile, and I forced myself to touch her on the back as if in fun.

"Now," I said, forcing myself, 'do you want me to lift you over it? I'll try if you like, for, though you weigh a tidy bit, I reckon, I'm strong for my size.'

"She answered me in a husky whisper that I was to get over the stile first and she'd follow.

"What?" I said, laughing, but feeling regular desperate. 'Afraid o' me seeing your ankles? Well, show me your face, anyhow. What you're showing me now is only your neck and your chignon.'

"You're laughing at my red hair," she whispered, getting her head lower still. 'It disgusts you—red hair does, I suppose?'

"I don't mind the color o' your hair," I said, laughing. 'There's plenty of it. That's the main thing with hair. Come,' I says, 'we're wasting the daylight; we shall have the dusk directly;' and I took possession of her by the shoulders and compelled her. "There, now, let's have a squint at you. Well, I'm blowed," I said, 'I've hit the target with that remark, it seems;' and I laughed in real earnest. For I see then that there was a bit of round-the-corner work with her eyes—nothing to matter, but what the

doctors call a cast. 'Appears to be fashionable in these parts,' I said. I was thinking of Brickett. I told you how he squinted. It has its bearing on what follows.

"I was like that from birth," she said, moving her hands as if to hide her face. 'I suppose you find it a great disfigurement?'

"Oh, no," I said, still laughing. 'I don't mind it.'

"Oh, stop laughing at me," she says.

"Then, without the slightest warning, she bursts into tears. Her sobs were something pitiful to hear. I never been so upset before or since; and, do how I would, I couldn't comfort nor console her. I was beside myself about her going on like that. 'It's not a bit o' good,' she cried. 'Go away, leave me alone, let me get home and conceal myself. You've tried to take to me, but you can't. You don't like me, and you never will. Nobody ever will.'

"Why prolong it? I made the discovery then and there that she was precisely in the same boat as myself. She confessed to me while I was wiping her eyes what she had suffered, seeing the other servants picking up their young men, taking this one, that one, like fruit off a tree, and her thinking she'd never have 'one herself. Believe me, it's the simple fact of it—there was nothing what had tortured me about young women that she hadn't felt lit'rally the same about young men.

"My nervousness was gone—gone forever too. I didn't take her down among the crowd on the pier—not much. Give one look at it, both of us, and watched it with the pretty lamps showing as the dusk came down on us from a distance. We didn't want a drink either. We'd found where the 'oney was, sweet an' refreshing, an' we meant to sip it by ourselves.

"Look here," said Mr. Hopkins, loudly, almost aggressively, "I'm sixty-eight years of age, I am; and that night is still yesterday. See what I mean? On top of all it was moonlight before 10 p.m., flashing out there on the water; and those pier lamps twinkling like—like so many stars tumbled down out of the sky at our feet.

"We sat upon the sandy ground half-way down the cliff, with the heather to our elbows, looking at it all and embracing one another. She told me how she'd never bin kissed before, and I told her the same. 'D'you like it, dear?' I asked her. 'It's 'eavenly,' she whispered. And so it was.

"My feelings!" said Mr. Hopkins, loudly. "It was a triumph. I felt big as the figurehead of a four-mast sailing ship. Rapture—holding one of the other sect, all contented in my arms. You know what I mean? You've tasted it yourself. But yet, no, you haven't either—not considering my age at the time, twenty-three years. I don't believe any one as ever lived has done so to the

full extent I did that night—not the mutual gratification of it, as I may term it—us two together opening of what had been a sealed book to both of us, under such romantic circumstances."

MR. HOPKINS relit his pipe, took a few meditative puffs, and went on again.

"So there it was. Gwennie—that was her name, Gwen, as I called her—Gwen and I were an engaged couple. I told Brickett it had been love at first sight on both sides, and for the first time I let him cadge on me—lending him a bob or two to drink our health before breakfast next morning—for the pubs were closed by the time I met him. I lent him some more next day. I couldn't refuse him now.

"I was another bein'—up somewhere like a balloon, above myself and everybody else. To give you a clue to my feelings, I never so much as asked Gwen a word about her money—you know, the legacy what Brickett had mentioned. I'd clean forgot. It was love I was after, not the money. But she spoke about it herself. It was all right—a hundred pounds as she'd inherited. So much the better.

"I used to make my lair in that little wood with the bushes, and bide there waiting for her till she could get out to me. Her hour was nine o'clock, when the fam'ly had finished their dinner and the other servants at their supper, an' she could slip out for twenty minutes without remarks being made. She never missed an evening, and so proved the depth of her affection.

"I suppose it was better part of a week when blowed if I didn't go and have an accident—yes, sprained my ankle and couldn't put my foot to the ground. I went to the expense of a doctor, and he ordered me to rest it till further orders.

"Well, the second evening I was deprived of her I couldn't bear it any longer. Doctor or no doctor, I'd got to go to her—if I crawled there on my hands and knees. The pain give me beans, but I'd bound up my ankle double tight, and I crept my way up to that cliff and into the wood.

"It was ten past nine, and she was there a'ready—with *somebody else*.

"Yes, they were coming along the path towards me—her and another man—her voice and his I heard as plain as I could hear you. It was Brickett. He had his arm round her waist, and it was 'Gwennie,' 'Gwennie, my dear,' and cetera; and she responding to him all love and kindness.

"The pain I felt at that moment was worse, far worse, than what my foot could give. It was knives through and through, till my anger swept over me. My anger was something fearful.

"D'you follow what I mean? I read it up straight away. They'd bin foolin' me. Brickett, with the power what I knew he possessed, had got hold of this

girl so's she b'longed to him body and bones; but for their own reasons they wished to secure some juggins like me to give her the state of a married woman. Why should she fall in love with me? Not likely—not much. All my old disbelief in myself had come rolling back on me, and I seemed to see the whole dashed plot. I'm not surprised I was angry.

"'You stop,' I shouted, for he was running away. 'You wait for me, you sneakin' dog. D'you think I'm goin' to take your leavings?' and I hobbled after him, till he had to stop. 'Put up those dirty hands of yours,' I said, 'and we'll see.'

"Then Gwen springs in between us.

"'Don't 'it 'im, Jack,' she cries. 'He's my brother.'

"And that was the truth at last. So it came out finally.

"They were respectable people, and Brickett—his true name was Shaw, of course—he'd used a many names, he having gone wrong, the whole family felt the disgrace and barred him. My Gwen being the only one of them who suffered him—and then in secret. The more credit to her, I thought, when I came to understand it, because it proved her good heart.

"But, mind you, a wrong 'un is a wrong 'un. It further came out that he'd made her promise to give him half her hundred pounds if he could find her a decent young man who'd accept her hand in church. I had to put a stopper on such a robbery as that, and Brickett and I quarreled over it for good an' all. Nevertheless and notwithstanding, I knew Gwen helped him often after our marriage, an' I winked at it."

Mr. Hopkins sighed, and knocked the ashes from his pipe.

"Fourteen years she was a true help-mate to me, bearing me three—Gladys, who died; Edwin, in the R.F.A., wounded at the second battle of Ypres, now porter at the Ulysses Mansions, Earl's Court, London; and Jane, one of the head nurses in a hospital for the insane. Then I lost her. Mourned her eighteen months, and then married the present Mrs. Hopkins, to keep the home going. Yes, I've had two good wives. But, as you can say, with the first one I buried all the romance of my life. The present Mrs. Hopkins was the other sort of union.

"Look here." He brought forth from his breast pocket something wrapped in paper, and as I watched him I saw that there were tears in his eyes. "There's my Gwen"—he was handing to the fat man a faded gilt-framed photograph—"my little Gwen, as she was when I wooed and won her. No one knows that I carry that about with me in my pocket," and the tears rolled down his wrinkled face.

And I thought that all values are relative, and all things colored by the eyes that look at them. Essentially, it *was* romance.

THE MOUNTAIN-BORN DEMOCRACY OF SWITZERLAND

International

A SWISS "TOWN MEETING"

Switzerland is a federation of twenty-two independent Cantons, each of which has its own parliamentary bodies. In four of the Cantons the old system of public assemblies and voting is still in vogue, the first Sunday in May of every year being designated as the time when the populace of the Cantons meet in the public square to cast their votes. The governor of each Canton conducts this public meeting, known as "the Landesgemeinde," one of which is shown in session here

THE BOOK TABLE

A FEW MORE NOVELS

SOLOMON, who had ample opportunities to know what he was talking about, speaks feelingly in his Song about jealousy. It is "cruel as the grave"—or even worse according to the Revised Version, "cruel as Sheol." "The coals thereof are coals of fire which hath a most vehement flame." Barring the tremendous exposition of male jealousy in "Othello," one doubts if any one has more searchingly depicted the corroding effect of jealousy on happiness than Mrs. Deland in "The Vehement Flame"—her first novel since "The Rising Tide," six years ago. That story dealt with a brilliant woman in revolt against convention, this with a mentally stupid woman whose adoration of her husband, a man naturally patient, kindly, and responsive to affection, wears out his endurance by its very excess and monotony, and finally alienates his love, though not his sense of duty to another. It is true that the marriage was a fearful mistake from the outset, in that the bride was thirty-nine years old and the groom nineteen. But the real study of the novel is not of disparity; with Eleanor's narrow outlook on life and her failure to bind Maurice to her by romance the problem would have been much the same in any case; the age disparity was not what lost her happiness, but it helped feed her "vehement flame." She was pitifully like her own pet dog, who growled to the minute of her death at any one who even looked at his mistress. It was the very nature of Eleanor's jealousy that she could not help her husband to enjoy art or outdoor life or friendships, nor did she even do what her coarse-grained aunt constantly urged, "feed him and entertain him." In short, she was bound down by selfish love and burning, restrained jealousy.

Obviously, "The Vehement Flame" is rather of the class to which Mrs. Deland's "The Awakening of Helena Richie" and "The Iron Woman" belong than to that of the "Old Chester Tales" and "Doctor Lavendar's People." It has not all the strength or unity of situation to be found in the first two, nor the humorous twinkle of the second two—it would be hard to name four more worthy pieces of fiction writing by any living American novelist—but it is a vigorous and subtle study of a complex human character.

Not since "Tante" has Anne Sedgwick given us a stronger single character than that which pervades and dominates her "Adrienne Toner."² To my liking, "Tante" still remains her best "all round" novel because of its diversity of

From a painting by Joseph Cummings Chase
MARGARET DELAND

character and motive; here everybody and everything is a "feeder," as theatrical people say, to Adrienne. Not that they are dummies; they are clearly sketched silhouettes, but Adrienne's depiction is like a full-size Sargent portrait. The sub-title is quite correct, but it really doesn't matter a pin that Adrienne is an American and her husband an Englishman. Reverse the nationality, and the *motif* of the character study would be the same.

We have all known women who have had some or all of Adrienne's traits—absolute confidence in herself, certainty that others will and should see her light and follow her path, perfect unconsciousness that she is meddling in others' affairs, and withal such serenity and desire to make the poor old world happy and good that disciples and ad-

ANNE DOUGLAS SEDGWICK

mirers flock around her. Adrienne can cure sick-headaches by the touch of her hand—sometimes; so she knows that she cannot give wrong moral advice; yet she totally ruins the life of a young girl by telling her that if she deeply loves a married man she would better elope with him so that he may get a divorce and marry the girl; before the divorce comes the man is killed; naturally, that girl hates Adrienne as bitterly as she had adored her—yes, even after the girl has found another husband, for the author has an ironic touch here and there. Even the cynical man of the world, the narrator of the story, falls a victim to the fascination of Adrienne, to his own ultimate unhappiness, after she has at last seen the amazing self-adulation in her pose to the world. This novel is intellectually keen and a little hard in tone; as a piece of masterful character dissection it is a notable work.

Not every one will like Thomas Beer's "The Fair Rewards,"³ but few will deny that it is clever. As with some bits of painting, it is amazing to see how by a touch of color here and there, a high light in just the right spot, he makes us see people and things just as he wants us to see them. One critic's just comment is that the story is "neither blatant nor vulgar, although it deals with people who are both." Certain phases of stage life—that of the producers, that of the designers of stage setting and decoration, and that of art lighting, perhaps more than the actual acting—form a background for the few characters. Realism of a queer and attractive kind is helped on by occasional appearances or references to well-known people of the stage—Charles Frohman, John Drew, Anna Held, Mrs. Gilbert, and a dozen others. The leading character, Mark Walling, was picked up on a Jersey farm and married by a tumultuous and dangerous blonde emotional actress. He makes a hit in a two-line part by his ingenuous simplicity—and simply ingenuous he remains through his career as manager and theater-owner. We suspect that the author half despises Mark because he is affectionate, emotional, and faithful to his bucolic relatives. His "rewards" are somewhat doubtful—the niece on whom he lavishes affection and advantages seems too intelligent to make quite as big a fool of herself as she did. Some of us will beg leave to like Mark whether his creator does or not; he may be sentimental, but his soul has at least some bigness, and for that he stands out in a rather tawdry group. Certainly Mr. Beer shows us things; he can write.

There is a joyous feeling of freshness and youthful energy about Mr. Hubbard's "Chanting Wheels"⁴ that catches

³ The Fair Rewards. By Thomas Beer. Alfred A. Knopf, New York. \$2.50.

⁴ Chanting Wheels. By Hubbard Hutchinson. G. P. Putnam's Sons, New York. \$1.75.

and holds attention. In a way it is a musical story; in a way it is a brotherhood of workers' story; just how the two are combined is distinctly original. Dante Rossetti Raleigh—musician, athlete, college graduate—cares little for social prestige or conventions. He goes to work as a brawny laborer in his uncle's mill, finds strange musical traditions and folk-song lore among the foreigners, stimulates them into musical activity, and evolves for them a noble song that embodies the meaning of the mill's "chanting wheels." So, when revolutionary agitators come, the men are not interested; they have a close-knit comradeship of their own.

Algernon Blackwood's theme in "The Bright Messenger"⁵ is the supposed dual personality of a commonplace young fellow who suddenly presents evidence of being inspired by "a great cosmic intelligence." But a psychoanalyst thinks this is an intrusion of the young man's subliminal self—the reader may take his choice. No one equals Mr. Blackwood in delicate imaginative manipulation of the psychically mysterious or mon-

THOMAS BEER

strous. On the whole, however, one feels that his peculiar genius (and it really is genius) is better suited to the short tale than the elaborated romance.

R. D. TOWNSEND.

THE NEW BOOKS

BIOGRAPHY

FALL OF MARY STUART (THE). By Frank A. Mumby. Houghton Mifflin Company, Boston. \$5.

We here gain a more vivid view of Mary Stuart than has been possible from any formal biography. We have an estimate from her own contemporaries—by Queen Elizabeth, by Catherine de Medicis, by Bothwell and Lethington. Of all these estimates, that of Elizabeth is the most acute; it clearly reveals the masculine instincts of the English Queen as opposed to Mary's fascinating but purely feminine qualities.

DANIEL H. BURNHAM: ARCHITECT, PLANNER OF CITIES. By Charles Moore. Illustrated. 2 vols. Houghton Mifflin Company, Boston. \$20.

In one sense these sumptuous volumes have to do even more with the future than with the past; for the future will doubtless show what the past has not shown—that in America certain principles of city-planning are now established. This is due to the late Daniel Burnham as much as to any one, perhaps more than to any one. Certainly he laid the foundations on which Cleveland, San Francisco, Chicago, and Manila are being reconstructed. Almost his latest labor in this direction was to prepare plans for the reconstruction of Baguio, in the Philippines. Without pay, Burnham visited the islands in order to plan for the beautification of Manila and for the laying out of a capital in the fine mountain climate of Baguio. This visit and other efforts towards the education of the public in city-planning justified Mr. Taft in saying that no man in the professional life of the United States had given more of his life to the public without having secured public office than had Daniel

Burnham. The present volumes are a worthy memorial of this city-planner and architect. In architecture he was eminent indeed—as the thousands who daily use the Union Railway Station in Washington can witness. Director of Works at the Chicago World's Fair (1893), he formed friendships with men distinguished in the several arts—for instance, Charles F. McKim, Augustus Saint-Gaudens, Frank Millet, Theodore Thomas. With the first two he was associated eight years later in preparing the new plans for Washington.

FIRST MILLION THE HARDEST (THE). By A. B. Farquhar. Doubleday, Page & Co., Garden City. \$3.50.

The life-work of a successful business man with a genius for friendship is described in this book with winning simplicity. The side-lights on the many prominent figures in American life whom the author has met in his long career are extremely interesting—particularly in the opening chapter, which tells how most of New York City's early business magnates were successfully "interviewed" by the author when a mere boy.

POETRY

OLE MARSTER, AND OTHER VERSES. By Benjamin E. Valentine. Whitet & Shepperson, Richmond, Va. \$1.

Even a reader with a congenital dislike for dialect poetry could hardly fail to see that this volume contains a number of sound pieces of work, the result of an indubitable knowledge of Negro psychology and Negro methods of speaking and reacting to life. The Negro types who speak through the verses included in this book are in practically all cases "befo' de wah" colored folk. One must assume that Mr. Valentine is

an old-time Virginian, so cleverly does he catch the whimsicalities and delightfully ingenuous turns of thought and speech of a type that is rapidly passing away. No mere rhymster could impregnate his lines with such authenticity as is to be found in "Keep Er-Grinnin'," for instance, a poem which begins:

When you heah "Ole Tribberlation"
come er tyarin' down de road,
An' you know he gwine ter kotch you
an' you got ter byar de load;
When you feel his bridle pullin', an'
de saddle on yo' back,
An' de whip is wavin' roun' you, an'
er hittin', ev'y crack—
Den remember 'bout de possum whar
wuz settin' on de lim',
Wid de gun er p'intin' at him, an' de
dorgs er treein' him;
How he holler ter de hunter an' he
holler ter de houn':
"Ize er gwinn' ter keep er grinnin', doh
I spec' you'll fotch me down."

This book, together with several others, affords an excellent proof of the literary consciousness that is steadily growing below the Mason and Dixon Line.

SONGS OF THE COWBOYS. An Anthology. By N. Howard Thorp. Houghton Mifflin Company, Boston. \$2.50.

SONGS OF THE TRAIL. By Henry Herbert Knibbs. Houghton Mifflin Company, Boston. \$2.50.

Mr. Thorp's anthology really affords lovers of poetry a brief view of a type of American song that must, in a certain measure, be regarded as folk-song. Although it has been patched together from the literatures of several countries and from individual creation, it forms in bulk an indigenous product peculiar to our own West. The cowboys of the recent past, it may be gathered, were realists in the true sense of the word. They sang about the things that surrounded them, and with not too great flights of imagination. A free lilt and decided swing and a lusty practical humor appear to be the distinguishing marks. Mr. Knibbs's volume is much more restrained and refined than the anthology. He handles the same themes, but he translates them into a material that is on a higher poetical level. Strangely enough, this refinement sets off the virile sturdiness and sincerity of the genuine cowboy songs all the more.

YOUNGSTERS: COLLECTED POEMS OF CHILDHOOD. By Burges Johnson. E. P. Dutton & Co., New York. \$2.50.

No matter how individual the verse may be, whenever a writer attempts to write children's poetry from the child's view-point he is bound to suffer comparison with Robert Louis Stevenson. The work of Tusitala stands as a model, and not even James Whitcomb Riley or Eugene Field, delightful as they often were, have supplanted that earlier favorite. And neither does Burges Johnson, although in the 250 pages of his "Youngsters" he presents many charming exhibits. His dexterity is apparent, and these bits of verse, gathered from previous volumes together with a number of new pieces, undoubtedly will please the child. But be sure the child has imbibed his Stevenson; there will be time for Mr. Johnson after.

THE GREAT AMERICAN
DESERT

A "By the Way" note in a back number of The Outlook reads: "We no longer see on our maps "The Great American Desert." That is true, for the name is not popular; but the desert is still there. In the interest of accuracy, a pertinent statement of the facts may be quoted from the prefatory pages, by O. E. Meinzer, in a "Water Supply Paper" (490-B) entitled "Routes to Desert Watering Places in the Mohave Desert Region, California," prepared by D. G. Thompson and published this year by the United States Geological Survey:

"The desert region of the United States forms a great triangle whose base, 800 miles long, is the Mexican border from the Peninsular Mountains in southern California to the mouth of the Pecos River in Texas, and whose apex is in north-central Oregon. . . . It covers about 500,000 square miles, or very nearly one-sixth of the area of the United States. This region is by no means devoid of natural resources or human activity. It contains prosperous cities, fertile agricultural districts, forest-clad mountains, a large aggregate number of watering-places, many rich mines, and an unknown wealth of mineral deposits. But the localities that have water supplies are widely separated oases in a vast expanse of silent, changeless, unproductive desert, whose most impressive feature is its great distances and whose chief evidences of human occupation are the long, long roads that lead from one watering-place to another. In the future existing oases will be enlarged, many new ones will be created, and the mineral and agricultural products of the region will be greatly increased. But in spite of all that man can do this large region will remain essentially a desert."

That is a true and courageous statement, and the frank use of the words, desert and oases, instead of dry country and settlements, is to be commended. The statement gives a true summary of "the Great American Desert," yet the desert is not so absolutely barren as certain parts of the Sahara or of the Desert of Gobi, in central Asia. The American Desert, which extends southward into Mexico, has over the greater part of its surface a varied vegetation, in which sage-brush, yuccas, creosote bush, and many kinds of cactus are common. Its mountains here and there contain valuable mineral deposits. According to Thompson, San Bernardino County, the desert southeastern corner of California, yielded over \$50,000,000 in mineral products in the twenty-four years from 1894 to 1918; but after this yield is taken the desert is more barren than before. A rich deposit will attract a temporary colony of feverish activity, depending on outside sources for nearly all its supplies, and vanishing when the deposit is worked out; thus the famous mining town of Calico, "which in the late eighties is said to have had a population of more than 5,000," has had only three or four inhabitants in recent years. It is the irrigable areas of the desert

How Pretty Teeth

affect the smile—teeth freed from film

See what one week will do

The open smile comes naturally when there are pretty teeth to show. But dingy teeth are kept concealed.

The difference lies in film. That is what stains and discolors. That is what hides the tooth luster. Let us show you, by a ten-day test, how millions now fight that film.

Why teeth are dim

Your teeth are coated with a viscous film. You can feel it now. It clings to teeth, gets between the teeth and stays.

No ordinary tooth paste can effectively combat it. The tooth brush, therefore, leaves much of it intact.

That film is what discolors, not the teeth. It often forms the basis of a dingy coat. Millions of teeth are clouded in that way.

The tooth attacks

Film also holds food substance which ferments and forms acids. It holds the acids in contact with the teeth to cause decay.

Germs constantly breed in it. They, with tartar, are the chief cause of pyorrhea. Thus most tooth troubles are now traced to film, and very few people escape them.

Must be combated

Dental science has long been seeking a daily film combatant. In late years two ef-

fective methods have been found. Authorities have proved them by many careful tests. Now leading dentists nearly all the world over are urging their daily use.

A new-day tooth paste has been perfected, made to comply with modern requirements. The name is Pepsodent. These two great film combatants are embodied in it.

It goes further

Other effects are now considered essential. Pepsodent is made to bring them all.

It multiplies the salivary flow. It multiplies the starch digestant in the saliva. That is there to digest starch deposits on teeth, so they will not remain and form acids.

It multiplies the alkalinity of the saliva. That is Nature's neutralizer for acids which cause decay.

Thus every application gives these tooth-protecting forces multiplied effect.

These things mean whiter, cleaner, safer teeth. They mean natural mouth conditions, better tooth protection. This ten-day test will convince you by what you see and feel. Make it for your own sake, then decide what is best.

Pepsodent PAT. OFF.

THE GREAT AMERICAN DESERT (Continued)

that attract a permanent population and yield a steady product; but the total irrigable area is small. On this topic Thompson writes: "Inspired by the successful agricultural development of certain portions of the arid regions of North America by irrigation in recent years, some writers have painted colorful word pictures of these regions in the future when man has transformed them all into productive farms. Undoubtedly there are thousands of acres that can still be developed by irrigation. . . . Nevertheless it is true that the quantity of water available from all sources is not sufficient to irrigate more than a small part of the aggregate area of arid land."

Your note went on to say: "Nowadays automobile tourists drive safely where a generation or two ago pioneers toiling painfully through the sand often dropped exhausted by the way." This is also true in the sense that you meant, but it is dangerously misleading in implying that the desert is no longer dangerous. It is still so dangerous in its driest, hottest, and least explored part, namely, the Mohave Desert area, including Death Valley, and comprising 60,000 square miles in southeastern California, that the sum of \$10,000 appropriated by Congress in 1916 for the marking and protection of desert watering-places, in the interest of public safety, was all expended in work on that single district, and even when the watering-places are marked the danger is not altogether removed. On the matter of desert travel Thompson says: "Since the advent of the automobile the use of horses has almost ceased. With this change travel in the desert has become less difficult and has therefore increased very much. . . . It must not be supposed, however, that travel in the desert with an automobile means travel without danger. In some respects the danger has increased. It is much easier to get a long distance from known watering-places with an automobile than with a team, and a breakdown at a remote point may be very serious. Since automobiles have come into use there is also much more travel by persons not familiar with the region. . . . With automobiles numerous difficulties may arise that were not encountered by those traveling with horses and wagons. . . . No one should go in an automobile far from a town who is not sufficiently familiar with the mechanism of the machine to make necessary adjustment of the carburetor and spark plugs and other minor repairs or who cannot make repairs to tires. This seemingly needless statement is made because there are many persons who know only how to manipulate the throttle and brakes of their cars. The writer has come upon such persons stalled on main roads of the desert, and they would have been in a bad plight on less traveled roads."

The best antidotes for such dangers are: "Know thyself, know thy car, and know thy country." **W. M. DAVIS.**

Cambridge, Massachusetts.

Try this *Kleradesk* for 10 days FREE

It will save you time sorting and locating papers

Will sort your mail and route it—will protect your papers from prying eyes and from being scattered by electric fan breezes—will keep papers, reference books, etc., out of the way, but at hand ready for use when needed. Occupies less space than a single box or wire basket, yet renders the service of four. Thousands in use give entire satisfaction.

A Steel Sectional Device

Olive green finish. Has non-scratching rubber feet. Price, \$4.50. Extra compartments at 90 cents each may be added at any time. On request, will send interesting, illustrated folder, "How to Get Greater Desk Efficiency."

Ask for FREE Trial—Send No Money

Send now for this Model 4-G Kleradesk. After using it ten days, if you are not satisfied that it saves you time and makes your desk work easier, return at our expense. Otherwise we will send you invoice for \$4.50, covering the biggest value in desk efficiency you ever bought.

ROSS-GOULD CO., 483 N. 10th Street, St. Louis, Mo.

CONTRIBUTORS' GALLERY

EDWARD A. FILENE was born at Salem, Massachusetts. He is the eldest son of William Filene, who founded the ready-to-wear specialty store which bears his name, and president of the William Filene's Sons Company. In addition

to his business interests Mr. Filene has taken an active part in the civic life of Boston. He has helped to organize the Boston Chamber of Commerce, the Chamber of Commerce of the United States, and the International Chamber, of which latter he is a director.

DR. R. TAIT MCKENZIE is an authority on anatomy and physical training. In 1904 he became Director of the Department of Physical Education at the University of Pennsylvania after several years spent as house physician, demonstrator, and lecturer. His pamphlets and articles on physical exercises, medical gymnastics, and anatomy have been of great value to physicians and surgeons. Dr. McKenzie is a powerful witness on the side of Mr. C. K. Taylor in the height-weight controversy which has been agitating our readers. Mr. Taylor will contribute another article next week on "The Girl and Her Muscle."

HUBERT V. CORYELL is a Harvard graduate and head of the Junior Department of the Browne and Nichols School of Cambridge, Massachusetts. He was formerly head of the Shady Hill Country Day School.

W. B. MAXWELL has been ranked by English critics as the best living English novelist with the exception of Mr. H. G. Wells and Mr. Galsworthy. Perhaps his best-known book is that called "Mrs. Thompson."

Free Will help **YOU** increase sales

This catalog will show you how to secure the names of your best prospective customers, those you want to reach most. Counts and prices are given on thousands of different lists, covering business concerns, professions and individuals, such as Noodle Manufacturers, Druggists, Coal Mines, Farmers, etc. Personalized sales letters and descriptive literature mailed to live prospects will increase your sales by creating direct orders or inquiries.

99% Guaranteed Mailing Lists backed by our \$5 refund

Insure your getting up-to-date information, for our Lists must be compiled from latest sources to avoid heavy losses through the guarantee.

SCOTLAND'S GRANDEST TOURS—

*Wonderful Fiords
Nearer than Norway*

1. **GLASGOW TO OBAN** by
magnificent swift Saloon Steamer "Co-
lumba," viewing the Shipbuilding on the
Clyde, passing Dumbarton Castle, and
calling en route at the beautiful Clyde
watering places of Dunoon and Rothesay,
thence by the famous Kyles of Bute,
Criman Canal and Firth of Lorn.

2. **OBAN TO STAFFA AND
IONA** is the grandest One-day Tour in
the British Isles, visiting Fingal's Cave
in the Isle of Staffa, St. Columba's Sacred
Isle of Iona, with its ancient Cathedral,
and the burying place of the Scottish
Kings, and passing the ancient Castles of
Dunollie, Dunart, Ardornish, Aros, Min-
garry, and Gylan, also Tobermorie Bay,
where lies the Armada specie ship.

3. **OBAN TO INVERNESS** via
beautiful Loch Linne and Loch Eil,
passing the scenes of the adventures of
Alan Breck, the hero of Robert Louis
Stevenson's famous novel "Kidnapped,"
viewing Glencoe, the scene of the great
massacre, and calling at the ancient
little town of Fort William, sheltering
pleasantly at the foot of Ben Nevis, Brit-
ain's highest mountain, through the
famous Caledonian Canal, Loch Oich and
Lochness, the land of Prince Charles and
his loyal Clanmen.
